| fc (Foreground Color) | <p>Specifies the foreground color for this value that was provided by the OLAP server. This attribute applies to OLAP-based PivotTables only. The color is specified as a HEX value in RGB space.</p> <p>The possible values for this attribute are defined by the ST_UnsignedIntHex simple type (§18.18.86).</p> |
| i (Italic) | <p>Specifies a boolean value that indicates whether the value contains italic formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains italic formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| in (Format Index) | <p>Specifies the index to the OLAP serverformat element where the format string for this entry is stored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| st (Strikethrough) | <p>Specifies a boolean value that indicates whether the value contains strikethrough formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains strikethrough formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| u (Unused Item) | <p>Specifies a boolean value that indicates whether this is an unused item. The application marks an item as unused when an item is deleted from the data source. The item and associated metadata are retained in the cache until the threshold for unused items specified in missingItemsLimit is reached.</p> <p>A value of 1 or true indicates this item is unused.</p> <p>A value of 0 or false indicates this item is used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| un (Underline) | <p>Specifies a boolean value that indicates whether the value contains underline formatting on the OLAP server. This attribute applies to OLAP-based PivotTables only.</p> <p>A value of 1 or true indicates this value contains underline formatting on the server.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean</p> |

| Attributes | Description |
|------------|--|
| | datatype. |
| v (Value) | Specifies the value of the item. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element's content model ([CT_String](#)) is located in §A.2. *end note*]

18.10.1.86 [serverFormat \(Server Format\)](#)

Represents the numeric format specified by the OLAP server for a tuple.

| Parent Elements |
|-----------------------------|
| serverFormats (§18.10.1.87) |

| Attributes | Description |
|-------------------|---|
| culture (Culture) | Specifies a language used to determine the currency symbol to display for currency values. [Example: if the culture is "en-us", the values in the application will format the values with a dollar sign. If the culture is "fr-fr" the application will format the values with a euro sign. <i>end example</i>] This value conforms to the language tagging conventions of RFC 3066 and later. The pattern <language>-<REGION> is used, e.g., "en-us" or "fr-fr". The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| format (Format) | Specifies the format string to use for all other numeric values. This string is supplied by the OLAP server. Therefore, the syntax for reading the format string depends on the server implementation. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ServerFormat](#)) is located in §A.2. *end note*]

18.10.1.87 [serverFormats \(Server Formats\)](#)

Represents the collection of numeric and currency formats specified by the OLAP server for a tuple

| Parent Elements |
|--------------------------|
| tupleCache (§18.10.1.94) |

| Child Elements | Subclause |
|------------------------------|-------------|
| serverFormat (Server Format) | §18.10.1.86 |

| Attributes | Description |
|----------------------|--|
| count (Format Count) | Specifies the number of formats in the collection. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ServerFormats](#)) is located in §A.2. *end note*]

18.10.1.88 set (OLAP Set)

Represents an OLAP sheet data set or tuple set. The set is defined by a Multidimensional Expressions (MDX) query that specifies criteria for the dimension members that belong to the set.

[*Example:* the following MDX expression defines the set for the 10 salespersons with the lowest sales:

```
BottomCount([Salesperson].[Salesperson Name].Members,10,[Measures].[Sales])
```

end example]

The MDX expression is specified in the setDefinition attribute.

| Parent Elements |
|--------------------|
| sets (§18.10.1.89) |

| Child Elements | Subclause |
|-----------------------------|-------------|
| sortByTuple (Sort By Tuple) | §18.10.1.91 |
| tpls (Tuples) | §18.10.1.93 |

| Attributes | Description |
|--------------------------|--|
| count (Number of Tuples) | Specifies the number of tuples in the set. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| maxRank (Maximum Rank) | Specifies the largest rank entry the user has requested. |

| Attributes | Description |
|------------------------------------|---|
| Requested) | The possible values for this attribute are defined by the W3C XML Schema int datatype. |
| queryFailed (Query Failed) | <p>Specifies a boolean value that indicates whether querying on this set failed.</p> <p>A value of 1 or true indicates a query against this set failed.</p> <p>A value of 0 or false indicates a query against this set succeeded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| setDefinition (MDX Set Definition) | <p>Specifies the Multidimensional Expressions (MDX) set definition.</p> <p>[Note: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn2.microsoft.com/en-us/library/ms145595.aspx end note]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| sortType (Set Sort Order) | <p>Specifies the sort order of the set.</p> <p>The possible values for this attribute are defined by the ST_SortType simple type (§18.18.74).</p> |

[Note: The W3C XML Schema definition of this element's content model (CT_Set) is located in §A.2. end note]

18.10.1.89 sets (Sets)

Represents the collection of OLAP sheet data entries or tuple sets.

| Parent Elements |
|--------------------------|
| tupleCache (§18.10.1.94) |

| Child Elements | Subclause |
|----------------|-------------|
| set (OLAP Set) | §18.10.1.88 |

| Attributes | Description |
|-------------------------|--|
| count (Tuple Set Count) | <p>Specifies the number of tuple sets.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Sets](#)) is located in §A.2. *end note*]

18.10.1.90 `sharedItems` (Shared Items)

Represents the collection of unique items for a field in the PivotCacheDefinition. The `sharedItems` complex type stores data type and formatting information about the data in a field. Items in the PivotCacheDefinition can be shared in order to reduce the redundancy of those values that are referenced in multiple places across all the PivotTable parts. [Example: A value might be part of a filter, it might appear on a row or column axis, and will appear in the `pivotCacheRecords` definition as well. However, because of the performance cost of creating the optimized shared items, items are only shared if they are actually in use in the PivotTable. Therefore, depending on user actions on the PivotTable layout, the `pivotCacheDefinition` and underlying `PivotCacheRecords` part can be updated. *end example*]

If there are no shared items, then field values are stored directly in the `pivotCacheRecords` part.

[Example:

```
<sharedItems count="1">
  <s v="[Customer].[Customer Geography].[Country].&[United States]"
    c="United States"/>
</sharedItems>
```

end example]

The following attributes are not required or used if there are no items in `sharedItems`.

- `containsBlank`
- `containsSemiMixedTypes`
- `containsMixedTypes`
- `longText`

The following attributes are not used unless there is more than one item in `sharedItems` or the one and only item is not a blank item. If the first item is a blank item the data type the field cannot be verified.

- `containsNumber`
- `containsDates`
- `containsString`
- `containsInteger`

The following attributes can be omitted without loss of functionality.

- `containsNonDate`
- `count`

The following attributes are not required and can be omitted. However, refreshing the PivotTable could produce different groupings than before.

- maxDate
- minDate
- maxValue
- minValue

Applications should ensure that “date” attributes are not mixed with “value” attributes.

| Parent Elements |
|-------------------------|
| cacheField (§18.10.1.3) |

| Child Elements | Subclause |
|---------------------|-------------|
| b (Boolean) | §18.10.1.2 |
| d (Date Time) | §18.10.1.21 |
| e (Error Value) | §18.10.1.27 |
| m (No Value) | §18.10.1.50 |
| n (Numeric) | §18.10.1.60 |
| s (Character Value) | §18.10.1.85 |

| Attributes | Description |
|---------------------------------------|---|
| containsBlank (Contains Blank) | <p>Specifies a boolean value that indicates whether this field contains a blank value.</p> <p>A value of 1 or true indicates this field contains one or more blank values.</p> <p>A value of 0 or false indicates this field does not contain blank values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsDate (Contains Date) | <p>Specifies a boolean value that indicates that the field contains at least one date.</p> <p>A value of 1 or true indicates the field contains at least one date value.</p> <p>A value of 0 or false indicates the field does not contain any date values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsInteger (Contains Integer) | <p>Specifies a boolean value that indicates whether this field contains integer values.</p> <p>A value of 1 or true indicates this field contains integer values.</p> <p>A value of 0 or false indicates non-integer or mixed values.</p> |

| Attributes | Description |
|---|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| containsMixedTypes (Contains Mixed Data Types) | <p>Specifies a boolean value that indicates whether this field contains more than one data type.</p> <p>A value of 1 or true indicates this field contains more than one data type.</p> <p>A value of 0 or false indicates contains only one data type. The field can still contain blank values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsNonDate (Contains Non Date) | <p>Specifies a boolean value that indicates that the field contains at least one value that is not a date.</p> <p>A value of 1 or true indicates the field contains at least one non-date values.</p> <p>A value of 0 or false indicates this field contains no date fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsNumber (Contains Numbers) | <p>Specifies a boolean value that indicates whether this field contains numeric values.</p> <p>A value of 1 or true indicates this field contains at least one numeric value.</p> <p>A value of 0 or false indicates this field contains no numeric values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsSemiMixedTypes (Contains Semi Mixed Data Types) | <p>Specifies a boolean value that indicates that this field contains text values. The field can also contain a mix of other data type and blank values.</p> <p>A value of 1 or true indicates at least one text value, and can also contain a mix of other data types and blank values.</p> <p>A value of 0 or false indicates the field does not have a mix of text and other values.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| containsString (Contains String) | <p>Specifies a boolean value that indicates whether this field contains a text value.</p> <p>A value of 1 or true indicates this field contains at least one text value.</p> <p>A value of 0 or false indicates this field does not contain any text values.</p> |

| Attributes | Description |
|-----------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| count (Shared Items Count) | <p>Specifies the number of shared items to load for this field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| longText (Long Text) | <p>Specifies a boolean value that indicates whether this field contains a long text value. A string is considered long if it is over 255 Unicode scalar values.</p> <p>A value of 1 or true indicates the value contains more than 255 Unicode scalar values of text.</p> <p>A value of 0 or false indicates the value contains less than 255 Unicode scalar values.</p> <p>[Note: This is used as many legacy spreadsheet application support a limit of 255 characters for text values. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| maxDate (Maximum Date Time Value) | <p>Specifies the maximum date/time value found in a date field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p> |
| maxValue (Maximum Numeric Value) | <p>Specifies the maximum numeric value found in a numeric field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> |
| minDate (Minimum Date Time) | <p>Specifies the minimum date/time value found in a date field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p> |
| minValue (Minimum Numeric Value) | <p>Specifies the minimum numeric value found in a numeric field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_SharedItems](#)) is located in §A.2. *end note*]

18.10.1.91 [sortByTuple](#) (Sort By Tuple)

Represents the sort applied to a tuple.

| Parent Elements |
|-------------------|
| set (§18.10.1.88) |

| Child Elements | Subclause |
|----------------|-------------|
| tpl (Tuple) | §18.10.1.92 |

| Attributes | Description |
|-----------------------|---|
| c (Member Name Count) | Specifies the number of member names. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuples](#)) is located in §A.2. *end note*]

18.10.1.92 [tpl \(Tuple\)](#)

Represents an OLAP sheet data entry member.

| Parent Elements |
|---|
| sortByTuple (§18.10.1.91); tpls (§18.10.1.93) |

| Attributes | Description |
|------------------------|---|
| fld (Field Index) | Specifies the index of the field to which the member belongs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| hier (Hierarchy Index) | Specified the index of the hierarchy to which the member belongs. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| item (Item Index) | Specifies the index of the item in the field that represents this item. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuple](#)) is located in §A.2. *end note*]

18.10.1.93 [tpls \(Tuples\)](#)

Represents members for the OLAP sheet data entry, also known as a tuple.

| Parent Elements |
|--|
| e (§18.10.1.27); m (§18.10.1.50); n (§18.10.1.60); query (§18.10.1.75); s (§18.10.1.85); set (§18.10.1.88) |

| Child Elements | Subclause |
|----------------|-------------|
| tpl (Tuple) | §18.10.1.92 |

| Attributes | Description |
|-----------------------|---|
| c (Member Name Count) | Specifies the number of member names. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Tuples](#)) is located in §A.2. *end note*]

18.10.1.94 tupleCache (Tuple Cache)

Represents the cache of OLAP sheet data members, or tuples.

| Parent Elements |
|------------------------------------|
| pivotCacheDefinition (§18.10.1.67) |

| Child Elements | Subclause |
|---|-------------|
| entries (Entries) | §18.10.1.28 |
| extLst (Future Feature Data Storage Area) | §18.2.10 |
| queryCache (OLAP Query Cache) | §18.10.1.76 |
| serverFormats (Server Formats) | §18.10.1.87 |
| sets (Sets) | §18.10.1.89 |

[Note: The W3C XML Schema definition of this element's content model ([CT_TupleCache](#)) is located in §A.2. *end note*]

18.10.1.95 worksheetSource (Worksheet PivotCache Source)

Represents the location of the source of the data that is stored in the cache.

[Example:

```
<cacheSource type="worksheet">
  <worksheetSource name="Table1" r:id="rId2"/>
</cacheSource>
```

end example]

| Parent Elements |
|--------------------------|
| cacheSource (§18.10.1.7) |

| Attributes | Description |
|---|--|
| id (Relationship Id) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the identifier to the Sheet part whose data is stored in the cache. See the Sheet section (§18.2) for more information. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| name (Named Range) | Specifies the named range that is the source of the data. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| ref (Reference) | Specifies the reference that defines a cell range that is the source of the data. This attribute depends on how the application implements cell references. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62). |
| sheet (Sheet Name) | Specifies the name of the sheet that is the source for the cached data. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_WorksheetSource](#)) is located in §A.2. *end note*]

18.10.1.96 x (Member Property Index)

Represents an array of indexes to cached member property values.

| Parent Elements |
|--|
| b (§18.10.1.2); d (§18.10.1.21); e (§18.10.1.27); i (§18.10.1.44); m (§18.10.1.50); n (§18.10.1.60); s (§18.10.1.85) |

| Attributes | Description |
|------------------|--|
| v (Shared Items) | Specifies the index into the shared items table in the PivotCache that identifies this item. |

| Attributes | Description |
|------------|--|
| Index) | The possible values for this attribute are defined by the W3C XML Schema int datatype. |

[Note: The W3C XML Schema definition of this element’s content model (CT_X) is located in §A.2. *end note*]

18.10.1.97 x (Shared Items Index)

This element represents an array of indexes to cached shared item values

| Parent Elements |
|--|
| discretePr (§18.10.1.26); r (§18.10.1.77); reference (§18.10.2.1); tables (§18.13.9) |

| Attributes | Description |
|------------------------|--|
| v (Shared Items Index) | Specifies the index into the shared items table in the PivotCache that identifies this item. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element’s content model (CT_Index) is located in §A.2. *end note*]

18.10.2 Shared Pivot Table Data

This section defines the part where shared PivotTable data is stored.

18.10.2.1 reference (Reference)

Represents a set of selected fields and selected items within those fields.

[Example:

```
<sh:reference field="4294967294" count="1" selected="0">
  <sh:x v="0"/>
</sh:reference>
```

end example]

| Parent Elements |
|-------------------------|
| references (§18.10.2.2) |

| Child Elements | Subclause |
|---|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Child Elements | Subclause |
|------------------------|-------------|
| x (Shared Items Index) | §18.10.1.97 |

| Attributes | Description |
|---|--|
| avgSubtotal (Include Average Filter) | <p>Specifies a boolean value that indicates whether the 'average' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the average aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| byPosition (Positional Reference) | <p>Specifies a boolean value that indicates whether the item is referred to by position rather than item index.</p> <p>A value of 1 or true indicates the item is referred to by position.</p> <p>A value of 0 or false indicates the item is referred to by index.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| count (Item Index Count) | <p>Specifies the number of item indexes in the collection of indexes (x tags).</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| countASubtotal (Include CountA Filter) | <p>Specifies a boolean value that indicates whether the 'countA' subtotal is included in the filter.</p> <p>A value of 1 or true indicates the count aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| countSubtotal (Include Count Subtotal) | <p>Specifies a boolean value that indicates whether the count aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the count aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

| Attributes | Description |
|---|--|
| defaultSubtotal (Include Default Filter) | <p>Specifies a boolean value that indicates whether the default subtotal is included in the filter.</p> <p>A value of 1 or true indicates the default subtotal is included in the filter. The default is to display the total or the grand total.</p> <p>A value of 0 or false indicates another subtotal or aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| field (Field Index) | <p>Specifies the index of the field to which this filter refers. A value of -2 indicates the 'data' field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| maxSubtotal (Include Maximum Filter) | <p>Specifies a boolean value that indicates whether the 'maximum' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the maximum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| minSubtotal (Include Minimum Filter) | <p>Specifies a boolean value that indicates whether the 'minimum' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the minimum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| productSubtotal (Include Product Filter) | <p>Specifies a boolean value that indicates whether the 'product' aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the product aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| relative (Relative) | <p>Specifies a boolean value that indicates whether the item is referred to by a relative</p> |

| Attributes | Description |
|--|--|
| Reference) | <p>reference rather than an absolute reference. This attribute is used if posRef is set to true.</p> <p>A value of 1 or true indicates the item is referred to by a relative reference.</p> <p>A value of 0 or false indicates the item is referred to by an absolute reference.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| selected (Selected) | <p>Specifies a boolean value that indicates whether this field has selection. This attribute is used when the PivotTable is in Outline view. It is also used when both header and data cells have selection.</p> <p>A value of 1 or true indicates the field has selection.</p> <p>A value of 0 or false indicates the field does not have selection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| stdDevPSubtotal (Include StdDevP Filter) | <p>Specifies a boolean value that indicates whether the population standard deviation aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the population standard deviation aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| stdDevSubtotal (Include StdDev Filter) | <p>Specifies a boolean value that indicates whether the standard deviation aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the standard deviation aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| sumSubtotal (Include Sum Filter) | <p>Specifies a boolean value that indicates whether the sum aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the sum aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> |

| Attributes | Description |
|---------------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| varPSubtotal (Include VarP Filter) | <p>Specifies a boolean value that indicates whether the population variance aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the population variance aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| varSubtotal (Include Var Filter) | <p>Specifies a boolean value that indicates whether the variance aggregate function is included in the filter.</p> <p>A value of 1 or true indicates the variance aggregation function is included in the filter.</p> <p>A value of 0 or false indicates another aggregation function is included in the filter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotAreaReference](#)) is located in §A.2. end note]

18.10.2.2 references (References)

Represents the set of selected fields and the selected items within those fields.

[Example:

```
<sh:references count="5">
  <sh:reference field="4294967294" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
  <sh:reference field="2" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
  <sh:reference field="14" count="1" selected="0">
    <sh:x v="0"/>
  </sh:reference>
```

```

<sh:reference field="15" count="2" selected="0">
  <sh:x v="2"/>
  <sh:x v="3"/>
</sh:reference>
</sh:references>

```

end example]

| Parent Elements |

| Child Elements | Subclause |
|-----------------------|------------|
| reference (Reference) | §18.10.2.1 |

| Attributes | Description |
|----------------------------|---|
| count (Pivot Filter Count) | Specifies the number of filtered records available in the PivotTable. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_PivotAreaReferences](#)) is located in §A.2. *end note*]

18.11 Shared Workbook Data

The Shared Workbooks architecture enables a spreadsheet application to record revisions made to a workbook (e.g., track changes), and is designed to enable either single, or multiple users editing the same workbook at the same time. Therefore, the application needs to support the ability to read changes made by another user and update its own state of the same workbook with those changes, even when those changes are made concurrently with other changes made by other users. Inevitably there are conflicts, and therefore merge conflict resolution should be supported the runtime application. The file format only contains enough information so that the spreadsheet application can deal with conflicts, and can undo/redo changes from the change history at run time.

18.11.1 Shared Workbook Data

Within a shared workbook, the changes made to the spreadsheet at runtime are persisted as sets of different revisions collectively forming a revision history. These are persisted to the file on disk during a save event, and are saved in different xml parts known as revision logs. There is a headers table xml part that summarizes when changes were made, who made them, and it lists the relationship from each header to the individual revision log that records the specific changes.

[*Example:* This example shows the header and revision log for two simple events: adding text to a cell, and inserting a new sheet.

First, take a look at the header table, and revision log:

```
<headers xmlns="..." xmlns:r="..." guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

And the revision log is essentially empty:

```
<revisions xmlns="..." xmlns:r="..." />
```

Now, after inserting the text "foo" into cell A1, and saving, the header looks like this:

```
<headers xmlns="..." xmlns:r="..." guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
  diskRevisions="1" revisionId="1" version="2">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4" userName="UserName"
    r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
</headers>
```

A new header entry is added, with a GUID and a revision ID (rId2) that specifies which log to look into to see the details about the revision.

The old log is saved, and the newly created log (corresponding to rId2) now looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rcc rId="1" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
        <phoneticPr fontId="0"/>
      </is>
    </nc>
  </rcc>
</revisions>
```

The log shows that the contents of a cell were revised, and the new cell contents is text containing "foo" as the string.

After inserting a new sheet, the header looks like this:

```
<headers xmlns="..." xmlns:r="..." guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
  diskRevisions="1" revisionId="2" version="3">
  <header guid="{A84A6777-8908-4CB9-9EB6-625CEFF419D3}"
    dateTime="2006-07-14T13:42:54" maxSheetId="4"
    userName="UserName" r:id="rId1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{CFEA9B63-728B-4274-A346-0440E1573AB4}"
    dateTime="2006-07-14T13:44:40" maxSheetId="4" userName="UserName"
    r:id="rId2" minRId="1">
    <sheetIdMap count="3">
      <sheetId val="1"/>
      <sheetId val="2"/>
      <sheetId val="3"/>
    </sheetIdMap>
  </header>
  <header guid="{7E1DAFA8-EF95-4865-8FE8-CC17B28635CF}"
    dateTime="2006-07-14T13:48:56" maxSheetId="5" userName="UserName"
    r:id="rId3" minRId="2">
```

```
<sheetIdMap count="4">
  <sheetId val="1"/>
  <sheetId val="2"/>
  <sheetId val="3"/>
  <sheetId val="4"/>
</sheetIdMap>
</header>
</headers>
```

You can see that the last, most recent, header entry shows an entry for the new sheet. The most recent log looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <ris rId="2" sheetId="4" name="[shared example.xlsx]Sheet4"
    sheetPosition="3"/>
  <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="delete"/>
  <rcv guid="{841DBE00-ECD0-478E-893B-30CE5DABBEF5}" action="add"/>
</revisions>
```

This shows the new sheet, sheetId 4, is added to the workbook. The custom view (rcv) for the user is updated as a new sheet was added.

end example]

18.11.1.1 header (Header)

This element is essentially a table that contains metadata about a list of specific changes that have taken place for this workbook. It lists when the changes were made, who made them, and the relationship IDs so that the log detailing the specific change can be found. If tracking changes, or sharing workbooks, are enabled, then changes are persisted on the Save event, or at a specified time interval. A header is created for each set of changes.

| minRId (Minimum Revision Id) | <p>The lowest revision id that belongs to this header.</p> <p>[<i>Note</i>: this can be used when, given a revision ID, the spreadsheet application needs to determine which revision log to access. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p> |
| userName (User Name) | <p>A string representing the name of the user making the revision..</p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p> |

[*Note: The W3C XML Schema definition of this element's content model ([CT_RevisionHeader](#)) is located in §A.2. end note*]

18.11.1.2 headers (Revision Headers)

This element represents the list of revision headers.

This section contains many references to history, versions, and revisions, and it is helpful to clarify the relationships here. In general, a series of changes (revisions) can be made to a spreadsheet. When a batch of those revisions is saved to disk, the version number of the spreadsheet is incremented. The batch of changes is saved to the revision history, which is persisted on disk with the file in the form of different log files and headers.

There are some attributes that deal with history which might seem redundant (such as `diskRevisions`, and `history`, among others) - these are there for backwards compatibility with older versions of spreadsheet applications and do not need to be used for creating new files.

| Child Elements | Subclause |
|-----------------|------------|
| header (Header) | §18.11.1.1 |

| Attributes | Description |
|--------------------------------|---|
| diskRevisions (Disk Revisions) | <p>A Boolean value indicating that this shared workbook file contains revisions. True when the workbook does have revisions, <code>false</code> otherwise.</p> <p>[<i>Note: this attribute is used for backwards compatibility. end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| exclusive (Exclusive Mode) | <p>A Boolean value indicating that this shared workbook is in exclusive mode.</p> <p>A workbook is in exclusive mode when a user has a lock on it for appending revisions to the file.</p> <p>[<i>Note: This is used for backwards compatibility with older spreadsheet applications. end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| guid (Last Revision GUID) | <p>The globally unique identifier of the last set of revisions. This shall match the GUID for the most recent header.</p> <p>The possible values for this attribute are defined by the <code>ST_Guid</code> simple type (§22.9.2.4).</p> |
| history (History) | <p>A Boolean value indicating that this shared workbook maintains a revision history. True if a history is maintained, <code>false</code> otherwise.</p> |

| Attributes | Description |
|---|--|
| | <p>[<i>Note</i>: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| keepChangeHistory (Keep Change History) | <p>A Boolean value indicating whether the revision history should be kept for this shared workbook. True if the history should be kept, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| lastGuid (Last GUID) | <p>Unique identifier of the last set of revisions that was saved into the file.</p> <p>The spreadsheet application can have certain modes, such as a timed save mode, where the application doesn't do a full save, but instead just appends the most recent revision records. In cases like this, for a new user that opens such a file while it is being edited, the file that was loaded from disk only have the changes that were saved during a full save. To get the current state of the file which includes edits by other users, the spreadsheet application would need to apply all the revisions from lastGuid to guid.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p> |
| preserveHistory (Preserve History) | <p>An integer representing the number of days the spreadsheet application shall keep the change history for this workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| protected (Protected) | <p>A Boolean value indicating whether the change tracking in this shared workbook can be removed. True if the tracking can be removed, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| revisionId (Revision Id) | <p>The current revision number of this shared workbook.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| shared (Shared Workbook) | <p>A Boolean value indicating that this workbook is shared. True when the workbook is shared, false otherwise.</p> <p>[<i>Note</i>: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| trackRevisions | <p>A Boolean value indicating that revisions are tracked in this shared workbook. True when</p> |

| Attributes | Description |
|-------------------|--|
| (Track Revisions) | <p>revisions are tracked, false otherwise.</p> <p>[<i>Note</i>: This is used for backwards compatibility with older spreadsheet applications. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| version (Version) | <p>An integer representing the current version of this shared workbook. The integer should begin counting from 1 for the first version.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_RevisionHeaders](#)) is located in §A.2. *end note*]

18.11.1.3 nc (New Cell Data)

This element represents new cell data that was added to the worksheet.

For most spreadsheet application purposes, only the data type and reference need to be used for revision tracking purposes. The rest of the cell properties can be written out, but are not necessarily needed as they can be recorded in other areas of the spreadsheet. For instance the <rfmt> element can be used to record style information instead of the S (style index) attribute.

| Parent Elements |
|------------------|
| rcc (§18.11.1.9) |

| Child Elements | Subclause |

| oc (Old Cell Data) | §18.11.1.5 |
| odxf (Old Formatting Information) | §18.11.1.6 |

| Attributes | Description |
|--|---|
| dxf (Formatting) | <p>A Boolean flag indicating that there was a differential formatting change for this cell - true if there was a formatting change, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| endOfListFormula Update (End of List Formula Update) | <p>A Boolean flag indicating that indicates that the formula used at the end of a list has been updated. True if the formula was updated, false otherwise.</p> <p>List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| numFmtId (Number Format Id) | <p>Zero-based index of the number format (Fmt) record used by this cell format (XF).</p> <p>The possible values for this attribute are defined by the ST_NumFmtId simple type (§18.18.47).</p> |
| odxf (Old Formatting) | <p>Flag indicating that there is old formatting information available for this cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| oldPh (Old Phonetic Text) | <p>A Boolean flag indicating whether there is old phonetic text information available. True when there is old phonetic text information available, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| oldQuotePrefix (Old Quote Prefix) | <p>A Boolean value indicating if a single quote prefix is was used on this cell previously. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix was used previously, false otherwise</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| ph (Phonetic Text) | <p>A Boolean flag indicating whether this cell contains phonetic text or not. True when the cell contains phonetic text, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| quotePrefix (Quote Prefix) | <p>A Boolean value indicating if a single quote prefix is used. Single quote prefixes are used to cause a formula to be evaluated as a string. True if a single quote prefix is used, false otherwise.</p> |

| Attributes | Description |
|-------------------------------------|---|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| s (Style Revision) | <p>Flag indicating that formatting change for this cell affected the cell's style. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| sId (Sheet Id) | <p>Internal identifier of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| ua (Revision From Rejection) | <p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| xDxf (Row Column Formatting Change) | <p>Flag indicating that the formatting change had an effect on the formatting of the entire row or column that this cell belongs to. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionCellChange](#)) is located in §A.2. end note]

18.11.1.10 rcft (Revision Merge Conflict)

This element represents a revision record which indicates that there was a merge conflict.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Attributes | Description |
|------------------------------|--|
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sheetId (Sheet Id) | <p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| ua (Revision From Rejection) | <p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionConflict](#)) is located in §A.2.
end note]

18.11.1.11 rcmt (Revision Cell Comment)

This element represents a revision record of a cell comment change.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Attributes | Description |
|----------------------------------|--|
| action (User Action) | <p>An enumeration identifying what kind of an operation the user performed on the comment.</p> <p>The possible values for this attribute are defined by the ST_RevisionAction simple type (§18.18.65).</p> |
| alwaysShow (Always Show Comment) | <p>A Boolean value indicating that the user has set this comment to always be visible. True if the comment is set to always be visible, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

| Attributes | Description |
|-------------------------------------|--|
| author (Author) | <p>A string representing the name of the author who changed this comment.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| cell (Cell) | <p>An A-1 style reference to the cell where the comment was changed.</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p> |
| guid (GUID) | <p>A globally unique identifier of this comment.</p> <p>The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4).</p> |
| hiddenColumn (Hidden Column) | <p>A Boolean value indicating that the comment belongs to a cell in a hidden column. True if the comment is in a hidden column, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| hiddenRow (Comment In Hidden Row) | <p>A Boolean value indicating that the comment belongs to a cell in a hidden row. True if the comment is in a hidden row, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| newLength (New Comment Length) | <p>Length of the comment text added in this revision.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| old (Old Comment) | <p>An ignorable Boolean value used for backwards compatibility that indicates that the original comment was created by a legacy spreadsheet application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| oldLength (Original Comment Length) | <p>Length of the comment before this revision was made.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sheetId (Sheet Id) | <p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionComment](#)) is located in §A.2. end note]

18.11.1.12 rcv (Revision Custom View)

This element represents a revision record of adding or removing a custom view to the workbook

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Attributes | Description |
|----------------------|---|
| action (User Action) | An enumeration representing the action that the user performed. The possible values for this attribute are defined by the ST_RevisionAction simple type (§18.18.65). |
| guid (GUID) | A globally unique identifier of the custom view. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4). |

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionCustomView](#)) is located in §A.2. *end note*]

18.11.1.13 rdn (Revision Defined Name)

This element represents a revision record of a defined name change.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Child Elements | Subclause |
|---|------------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |
| formula (Formula) | §18.3.1.43 |
| oldFormula (Old Formula) | §18.11.1.7 |

| Attributes | Description |
|------------------------|---|
| comment (Name Comment) | A string representing a comment about the defined name. This comment can be shown by the spreadsheet application in a names management UI so that users have more information about what the defined name is used for. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| customMenu (New) | A string representing the new custom menu text |

| Attributes | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|--|----|----------------|---|-----------|---|---------------|---|---------------|---|-------------|---|--------------------|---|----------|---|------|---|---------|---|-------------|----|----------|----|-------------|----|---------------|----|--------------|----|--------------|----|-------------|----|------|
| Custom Menu) | The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| customView (Custom View) | <p>A Boolean flag indicating that this named range belongs to a custom view</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| description (Description) | <p>A string representing the new description text for the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| function (Function) | <p>A Boolean value indicating that the defined name refers to a function. True if the defined name is a function, false otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| functionGroupId (Function Group Id) | <p>Represents the new function group id.</p> <p>Function group ids are used to help classify functions. For instance, functions in the same group can be searched or selected easily from the spreadsheet applications UI. For instance, filtering the list of all functions to allow the user to choose from functions used for financial data.</p> <p>The following group ids should be used:</p> <table data-bbox="414 1150 738 1753"> <tr> <th>ID</th><th>Function group</th></tr> <tr><td>1</td><td>Financial</td></tr> <tr><td>2</td><td>Date and Time</td></tr> <tr><td>3</td><td>Math and Trig</td></tr> <tr><td>4</td><td>Statistical</td></tr> <tr><td>5</td><td>Lookup & Reference</td></tr> <tr><td>6</td><td>Database</td></tr> <tr><td>7</td><td>Text</td></tr> <tr><td>8</td><td>Logical</td></tr> <tr><td>9</td><td>Information</td></tr> <tr><td>10</td><td>Commands</td></tr> <tr><td>11</td><td>Customizing</td></tr> <tr><td>12</td><td>Macro Control</td></tr> <tr><td>13</td><td>DDE/External</td></tr> <tr><td>14</td><td>User Defined</td></tr> <tr><td>15</td><td>Engineering</td></tr> <tr><td>14</td><td>Cube</td></tr> </table> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> | ID | Function group | 1 | Financial | 2 | Date and Time | 3 | Math and Trig | 4 | Statistical | 5 | Lookup & Reference | 6 | Database | 7 | Text | 8 | Logical | 9 | Information | 10 | Commands | 11 | Customizing | 12 | Macro Control | 13 | DDE/External | 14 | User Defined | 15 | Engineering | 14 | Cube |

| 14 | Cube | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Attributes | Description |
|--|---|
| help (New Help Topic) | <p>A string representing the new help topic text.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| hidden (Named Range Hidden) | <p>A Boolean value indicating whether the named range is now hidden.</p> <p>Hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| localSheetId (Local Name Sheet Id) | <p>An integer representing the id of the sheet to which this defined name belongs. This shall be used local defined names only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| name (Name) | <p>A string representing the name for this defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| oldComment (Old Name Comment) | <p>A string representing the old comment about the defined name.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| oldCustomMenu (Old Custom Menu Text) | <p>A string representing the old custom menu text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| oldDescription (Old Description) | <p>A string representing the old description text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| oldFunction (Old Function) | <p>A Boolean flag indicating that the old name was a function</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| oldFunctionGroupId (Old Function Group Id) | <p>Old function group ID.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> |
| oldHelp (Old Help Topic) | <p>A string representing the old help topic text</p> |

| Attributes | Description |
|------------------------------------|--|
| | The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| oldHidden (Old Hidden) | <p>A Boolean flag indicating whether the named range was hidden</p> <p>Hidden refers to whether the defined name is of a 'hidden' type. This applies to things like a custom filter on a cell, it has a name, but is hidden and so is not visible in any name management UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| oldShortcutKey (Old Short Cut Key) | <p>Old keyboard shortcut.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> |
| oldStatusBar (Old Status Bar) | <p>A string representing the old status bar text</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| shortcutKey (Shortcut Key) | <p>Represents the new keyboard shortcut.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> |
| statusBar (Status Bar) | <p>A string representing the new status bar text.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| ua (Revision From Rejection) | <p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RevisionDefinedName](#)) is located in §A.2. *end note*]

18.11.1.14 reviewed (Reviewed)

This element represents an identifier of a single reviewed revision. A reviewed revision, is a revision that has been reviewed via the spreadsheet application's track changes feature, has been accepted, and has been saved.

| Parent Elements |
|----------------------------|
| reviewedList (§18.11.1.15) |

| Attributes | Description |
|-------------------|---|
| rId (revision Id) | <p>ID of a reviewed revision.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Reviewed](#)) is located in §A.2. *end note*]

18.11.1.15 reviewedList (Reviewed List)

This element maintains a list of reviewed revisions.

| Parent Elements |
|---------------------|
| header (§18.11.1.1) |

| Child Elements | Subclause |
|---------------------|-------------|
| reviewed (Reviewed) | §18.11.1.14 |

| Attributes | Description |
|----------------------------------|--|
| count (Reviewed Revisions Count) | <p>Number of reviewed revisions.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ReviewedRevisions](#)) is located in §A.2. *end note*]

18.11.1.16 revisions (Revisions)

This element represents the root node of a list of revisions made in this shared workbook. This root node shows up at the beginning of every log file that contains specific revisions made to the workbook.

When multiple users are sharing, and editing, a workbook at the same time, there can be conflicting changes. The spreadsheet application should have logic to resolve such conflicts, and the file format should only contain enough information so that the spreadsheet application can restore the workbook to the correct state after conflict resolution. Revisions can also be tracked by the spreadsheet application for review by the user at a later time (as opposed to only dealing with conflicts on a save event.) Some edits to workbooks are made as a result of this conflict resolution. So, there are cases where a revision is effectively undone by another user, and as a result that undoing is itself a revision that adds or changes data in the file. These operations are tracked by the `ua` and `ra` attributes of many different elements.

[Example:

Step 1:

User 1 inserts Column A. So the XML in the revision log would look like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="1" sId="1" ref="A1:A1048576" action="insertCol"/>
</revisions>
```

Step 2:

User 2 synchronizes the file to pick up that change, but then activates the Track Changes feature, and rejects that change. This effectively performs an undo on User 1's insertion. This is denoted in the file with the `ua` attribute meaning that this change happened as the result of an undo. The XML for the revision log would look like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="2" ua="1" sId="1" ref="A1:A1048576" action="deleteCol"/>
  <rcft rId="1" ua="1" sheetId="1"/>
</revisions>
```

Step 3:

User 1 enters "foo" in A1, and saves the file. A conflict resolution dialog is shown since User 2's version of the file removed the inserted Column A. User 1 chooses to accept their own changes. This undoes the change that User 2 made. So, in effect, it performed an undo on a previous undo operation. This is denoted in the file format by the `ra` attribute meaning that a the change occurred because a previous undo was undone. So the resulting XML for the newest log file looks like this:

```
<revisions xmlns="..." xmlns:r="...">
  <rrc rId="3" ua="1" ra="1" sId="1" ref="A1:A1048576" action="insertCol"/>
  <rcft rId="2" ua="1" sheetId="1"/>
  <rcc rId="4" sId="1">
    <nc r="A1" t="inlineStr">
      <is>
        <t>foo</t>
      </is>
    </nc>
  </rcc>
  <rcft rId="2" sheetId="1"/>
</revisions>
```

end example]

|---|-----------|
| dx (Formatting) | §18.8.14 |
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Attributes | Description |
|---|---|
| length (Length) | <p>The number of characters that were affected by a string change, counting from start.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| s (Style) | <p>Flag indicating that this formatting change affected a cell's style. (Only applicable for Undo operations).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| sheetId (Sheet Id) | <p>An integer representing the internal id of the sheet on which the revision occurred.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sqref (Sequence Of References) | <p>A worksheet range to which this formatting was applied. [<i>Note</i>: For applications supporting the default grid size (see §18.17.5), full column and row references shall explicitly state the row and column components, e.g., "A1:A1048576" For column "A", and A1:XFD1 for row "1". Applications with larger grid sizes shall interpret these to mean "column A" and "row 1" respectively, for their larger grid size. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Sqref simple type (§18.18.76).</p> |
| start (Start index) | <p>An integer representing an index showing which character a string change starts at within the string in the cell.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| xfDxf (Row or Column Formatting Change) | <p>A Boolean flag indicating that this formatting change had an affect on the formatting of an entire row or column that an affected cell(s) belongs to. (Only applicable for Undo operations)</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RevisionFormatting](#)) is located in §A.2. *end note*]

18.11.1.18 [ris](#) (Revision Insert Sheet)

This element represents a revision record of a sheet that was inserted.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Attributes | Description |
|--------------------------------|--|
| name (Sheet Name) | <p>The name of the new sheet.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sheetId (Sheet Id) | <p>An integer representing the internal id of the sheet on which the revision occurred</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sheetPosition (Sheet Position) | <p>An integer representing the zero based position of the new sheet in the sheet tab bar.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| ua (Revision From Rejection) | <p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RevisionInsertSheet](#)) is located in §A.2. *end note*]

18.11.1.19 **rm** (Revision Cell Move)

This element represents a revision record on a cell(s) that moved.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Child Elements | Subclause |
|----------------------------|-------------|
| rcc (Revision Cell Change) | §18.11.1.9 |
| rfmt (Revision Format) | §18.11.1.17 |
| undo (Undo) | §18.11.1.25 |

| Attributes | Description |
|------------------------------------|---|
| destination (Destination) | New A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62). |
| ra (Revision Undo Rejected) | A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| rId (Revision Id) | An integer representing the number of this revision. This id shall apply to reviewable revision types only. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| sheetId (Sheet Id) | An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| source (Source) | The original A1 style location of the cell(s) that were moved The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62). |
| sourceSheetId (Source Sheet Id) | An integer representing the internal id of the sheet where the cell(s) originally resided. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| ua (Revision From Rejection) | A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the W3C XML Schema boolean |

| Attributes | Description |
|------------|-------------|
| | datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RevisionMove](#)) is located in §A.2. *end note*]

18.11.1.20 [rqt \(Revision Query Table\)](#)

This element represents a revision record of a query table field change.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Attributes | Description |
|----------------------------|--|
| fieldId (Field Id) | ID of the specific query table field that was removed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| ref (QueryTable Reference) | Location of the affected query table. The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62). |
| sheetId (Sheet Id) | An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RevisionQueryTableField](#)) is located in §A.2. *end note*]

18.11.1.21 [rrc \(Revision Row Column Insert Delete\)](#)

This element represents a revision record of a row/column insert/delete action.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Child Elements | Subclause |
|----------------------------|-------------|
| rcc (Revision Cell Change) | §18.11.1.9 |
| rfmt (Revision Format) | §18.11.1.17 |
| undo (Undo) | §18.11.1.25 |

| Attributes | Description |
|-----------------------------|--|
| action (User Action) | <p>Indicates the action most recently performed on the row or column.</p> <p>The possible values for this attribute are defined by the ST_rwColActionType simple type (§18.18.66).</p> |
| edge (Edge Deleted) | <p>A Boolean flag indicating that a row or column is being deleted at the edge of a sorted range (only applicable to a Delete Row/Column revision types).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| eol (End Of List) | <p>A Boolean flag indicating that a row or a column is being inserted at the end of a list of data.</p> <p>List in this context does not mean table, rather it refers to the feature where the spreadsheet application automatically creates an internal structure for making data input more consistent on adjacent rows or columns. For instance, if 3 cells in a row are entered with the same format, then when entering data into the 4th adjacent cell, the spreadsheet application might automatically apply that same format. In this case, those cells are treated as a list.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| ref (Reference) | <p>A reference to the location of the rows/columns that were inserted or deleted.</p> <p>[Note: A reference to a whole column or row must include both the column and row components. For example, column A is referenced by "A1:A1048576", and row 1 is referenced by "A1:XFD1". However, because this attribute value is occurring in the context of an entire row or column insert, the column component of a row reference can be ignored, and the row component of a column reference can be ignored. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Ref simple type (§18.18.62).</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sId (Sheet Id) | <p>An integer representing the internal id of the sheet on which the revision occurred.</p> |

| Attributes | Description |
|------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| ua (Revision From Rejection) | <p>A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT RevisionRowColumn](#)) is located in §A.2. *end note*]

18.11.1.22 rsnm (Revision Sheet Name)

This element represents a revision record tracking the renaming a sheet.

| Parent Elements |
|-------------------------|
| revisions (§18.11.1.16) |

| Child Elements | Subclause |
|---|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Attributes | Description |
|-----------------------------|--|
| newName (New Sheet Name) | <p>A string representing the new sheet name</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| oldName (Old Sheet Name) | <p>A string representing the old sheet name</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| ra (Revision Undo Rejected) | <p>A Boolean flag which indicates that this revision was due to a previous undo (ua) revision being rejected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rId (Revision Id) | <p>An integer representing the number of this revision. This id shall apply to reviewable revision types only.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

| Attributes | Description |
|------------------------------|---|
| sheetId (Sheet Id) | An integer representing the internal id of the sheet on which the revision occurred. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| ua (Revision From Rejection) | A Boolean flag indicating that this revision occurred because another revision was rejected and therefore undone. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_RevisionSheetRename](#)) is located in §A.2. *end note*]

18.11.1.23 [sheetId \(Sheet Id\)](#)

This element represents a sheet that revision can take place on. Each sheet in the workbook should be represented by one of these elements, and each sheet has an id associated with it. Sheet ids are used to refer to sheets internally by the spreadsheet application.

| Parent Elements |
|--------------------------|
| sheetIdMap (§18.11.1.24) |

| Attributes | Description |
|----------------|--|
| val (Sheet Id) | An integer serving as a number by which to reference the sheet internally. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetId](#)) is located in §A.2. *end note*]

18.11.1.24 [sheetIdMap \(Sheet Id Map\)](#)

This element represents a list of sheets and corresponding ids that are used for tracking revision records.

| Parent Elements |
|---------------------|
| header (§18.11.1.1) |

| Child Elements | Subclause |
|--------------------|-------------|
| sheetId (Sheet Id) | §18.11.1.23 |

| Attributes | Description |
|---------------------|---|
| count (Sheet Count) | Number of sheets. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_SheetIdMap](#)) is located in §A.2. *end note*]

18.11.1.25 undo (Undo)

This element represents undo information for row/column deletion when there are functions in the spreadsheet that reference the deleted rows/columns. This element is not applicable for insert revisions.

| Parent Elements |
|-------------------------------------|
| rm (§18.11.1.19); rrc (§18.11.1.21) |

| Attributes | Description |
|-----------------------|--|
| array (Array Formula) | Flag indicating that the affected formula is an array formula. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| cs (Cross Sheet Move) | A Boolean flag indicating this was a cross-sheet move. True if it was a cross sheet move, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| dn (Defined Name) | Identifies the named range that referenced the deleted cell range. Mutually exclusive with the cell reference attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| dr (Range) | The range which was deleted that is referenced by the affected formula. The possible values for this attribute are defined by the ST_RefA simple type (§18.18.63). |
| exp (Expression) | Identifies the expression that should be adjusted in the corresponding formula. The possible values for this attribute are defined by the ST_FormulaExpression simple type (§18.18.36). |
| index (Index) | Index of the expression within the corresponding formula that was affected by this |

| Attributes | Description |
|---------------------------|--|
| | change. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| nf (Defined Name Formula) | A Boolean flag indicating that the corresponding formula is part of a defined name. True if this formula is part of a defined name, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| r (Cell Reference) | Location of the cell whose formula referenced the deleted cell range. Mutually exclusive with the defined name attribute The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7). |
| ref3D (Reference 3D) | A Boolean flag indicating that the expression contained the sheet name in addition to the cell reference. True if it contained the sheet name, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sId (Sheet Id) | Internal Id of the worksheet that contained the formula that referenced the deleted cell range. Mutually exclusive with the defined name attribute. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| v (Value Needed) | A Boolean flag indicating the formula needs the actual value of the cell(s) it's referencing. True if the formula requires the value of the cell it references, false otherwise. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_UndoInfo](#)) is located in §A.2. *end note*]

18.11.2 Shared Workbook User Data

This subclause specifies information about the users of a shared workbook.

18.11.2.1 userInfo (User Information)

This element represents a user, and it stores information about a specific user as it relates to revisions.

| Parent Elements |
|--------------------|
| users (§18.11.2.2) |

| Child Elements | Subclause |
|---|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Attributes | Description |
|----------------------------|--|
| dateTime (Date Time) | Date and time when this user opened the shared workbook. The possible values for this attribute are defined by the W3C XML Schema dateTime datatype. |
| guid (User Revisions GUID) | A globally unique identifier identifying the last set of revisions that this uses is synchronized to. This attribute can be used by the spreadsheet application to ensure that revisions this user depends on aren't deleted. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4). |
| id (User Id) | An integer representing an internal user id for this user. This number can be negative. The possible values for this attribute are defined by the W3C XML Schema int datatype. |
| name (User Name) | Display name for this user [Note: User name strings should not be longer than 54 characters. <i>end note</i>] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SharedUser](#)) is located in §A.2. *end note*]

18.11.2.2 users (User List)

This element represents a list of users who currently have this shared workbook open. This list does not include any users who have the workbook open in Read-Only mode.

| Parent Elements |
|--|
| Root element of SpreadsheetML Shared Workbook User Data part |

| Child Elements | Subclause |
|-----------------------------|------------|
| userInfo (User Information) | §18.11.2.1 |

| Attributes | Description |
|---------------------------|---|
| count (Active User Count) | Number of users who currently have this shared workbook open. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Users](#)) is located in §A.2. *end note*]

18.12 QueryTable Data

Query tables are 2 dimensional tables of data bound to an external query of some kind. [Example: A query table could for example show specific data from a text file, from a web query, or from a database query. *end example*]

[Example:

Data connectivity can use a number of different technologies. The following spreadsheetML fragment is one an example of a query table connected to a database:

```
<queryTable xmlns="..." name="Northwind Orders" rowNumbers="1"
  growShrinkType="overwriteClear" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="0"
  applyPatternFormats="0" applyAlignmentFormats="0" applyWidthHeightFormats="0">
  <queryTableRefresh nextId="15">
    <queryTableFields count="12">
      <queryTableField id="1" name="OrderID" tableColumnId="1"/>
      <queryTableField id="2" name="CustomerID" tableColumnId="2"/>
      <queryTableField id="3" name="EmployeeID" tableColumnId="3"/>
      <queryTableField id="4" name="OrderDate" tableColumnId="4"/>
      <queryTableField id="5" name="RequiredDate" tableColumnId="5"/>
      <queryTableField id="6" name="ShippedDate" tableColumnId="6"/>
      <queryTableField id="7" name="ShipName" tableColumnId="7"/>
      <queryTableField id="8" name="ShipAddress" tableColumnId="8"/>
      <queryTableField id="9" name="ShipCity" tableColumnId="9"/>
      <queryTableField id="10" name="ShipRegion" tableColumnId="10"/>
      <queryTableField id="11" name="ShipPostalCode" tableColumnId="11"/>
      <queryTableField id="12" name="ShipCountry" tableColumnId="12"/>
    </queryTableFields>
  </queryTableRefresh>
</queryTable>
```

end example]

[*Example:* And here's an example of the SpreadsheetML fragment defining a query table connected to a text import:

```
<queryTable xmlns="..." name="data in text" connectionId="1" autoFormatId="16"
  applyNumberFormats="0" applyBorderFormats="0" applyFontFormats="1"
  applyPatternFormats="1" applyAlignmentFormats="0"
  applyWidthHeightFormats="0"/>
```

Elsewhere in the spreadsheetML file, a connection element is defined with the name "Northwind Orders" that describes how to connect to the appropriate database to refresh data for the query table. *end example*]

18.12.1 deletedField (Deleted Field)

This element specifies a field that has been deleted from the query table.

[*Example:*

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

| Parent Elements |
|------------------------------------|
| queryTableDeletedFields (§18.12.3) |

| Attributes | Description |
|----------------------------|--|
| name (Deleted Fields Name) | Specifies the name of the deleted field. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_DeletedField](#)) is located in §A.2. *end note*]

18.12.2 queryTable (Query Table)

This element specifies all the relevant properties for a query table, one query table element is stored for each query table object in the spreadsheetML document.

| Parent Elements |
|--|
| Root element of SpreadsheetML Query Table part |

| Child Elements | Subclause |
|--|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |
| queryTableRefresh (QueryTable Refresh Information) | §18.12.6 |

| Attributes | Description |
|--|---|
| adjustColumnWidth (Adjust Column Width On Refresh) | <p>Specifies whether to automatically adjust column widths on refresh to fit the data retrieved. <code>true</code> if column widths should be adjusted.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyAlignmentFormats (Apply Alignment Formats) | <p>If <code>true</code> apply legacy table autoformat alignment properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyBorderFormats (Apply Border Formats) | <p>If <code>true</code> apply legacy table autoformat border properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyFontFormats (Apply Font Formats) | <p>If <code>true</code> apply legacy table autoformat font properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyNumberFormats (Apply Number Formats) | <p>If <code>true</code> apply legacy table autoformat number format properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyPatternFormats (Apply Pattern Formats) | <p>If <code>true</code> apply legacy table autoformat pattern properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| applyWidthHeightFormats (Apply Width / Height Formats) | <p>If <code>true</code> apply legacy table autoformat width/height properties.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| autoFormatId (Auto Format Id) | <p>Identifies which legacy table autoformat to apply.</p> <p>Annex D contains a listing of the supported PivotTable AutoFormats, example formatting, and a sample workbook with each of those AutoFormats applied.</p> |

| Attributes | Description |
|---|--|
| | The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| backgroundRefresh (Background Refresh) | <p>Specifies whether or not the query table shall try to refresh data in the background.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| connectionId (Connection Id) | <p>Specifies the ID number of the external data connection to use to refresh data in the query table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| disableEdit (Disable Edit) | <p>Specifies whether the connection element used with this query table shall be editable. If true, then the connection is not editable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| disableRefresh (Disable Refresh) | <p>Specifies whether the query table shall be refreshable. If true, then the query table is not refreshable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| fillFormulas (Fill Adjacent Formulas) | <p>Specifies whether or not formulas in columns adjacent to the query table should be filled down whenever the query table is refreshed. This is helpful since the number of rows returned by a query table refresh operation can vary.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| firstBackgroundRefresh (First Background Refresh) | <p>Specifies whether or not data has ever been refreshed for this query table. If the very first background data refresh had not completed at the time the file was saved, this attribute is set to true.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| growShrinkType (Grow Shrink Type) | <p>Specifies the type of behavior expected for dealing with a variable number of rows of data in the query table between refresh operations.</p> <p>The meaning of the possible values of this attribute {insertClear, insertDelete, overwriteClear} are explained in detail in the definition of the simple type.</p> <p>The possible values for this attribute are defined by the ST_GrowShrinkType simple type (§18.18.39).</p> |
| headers (First Row) | Specifies whether or not the query table has first row with column titles. |

| Attributes | Description |
|---|---|
| Column Titles) | <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| intermediate (Intermediate) | <p>Specifies whether this query table is in an intermediate state, having been defined but not fully formed and populated with data.</p> <p>In this state, fields and ranges of the query table can be unknown.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| name (QueryTable Name) | <p>Specifies the name of the query table.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| preserveFormattin g (Preserve Formatting On Refresh) | <p>Specifies whether the application should try to preserve formatting in the query table and copy this formatting to any new rows of data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| refreshOnLoad (Refresh On Load) | <p>Specifies whether the query table shall refresh its data automatically when the spreadsheetML document is loaded or opened.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| removeDataOnSav e (Remove Data On Save) | <p>Specifies whether the query table shall remove all data from the worksheet before the spreadsheetML document is saved.</p> <p>This is very helpful for situations where people who have different permissions to view data want to share the same spreadsheetML document. All data from the last user is removed, and new users re-query the external data sources with their own credentials.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rowNumbers (Row Numbers) | <p>Specifies whether the query table shall include a first column of row numbers.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTable](#)) is located in §A.2. *end note*]

18.12.3 queryTableDeletedFields (Deleted Fields)

This element is the collection for deletedField (§18.12.1) elements, each of which represents a column or field that has been deleted from the query table.

[Example:

```
<queryTableDeletedFields count="2">
  <deletedField name="ShipVia"/>
  <deletedField name="Freight"/>
</queryTableDeletedFields>
```

end example]

| Parent Elements |
|------------------------------|
| queryTableRefresh (§18.12.6) |

| Child Elements | Subclause |
|------------------------------|-----------|
| deletedField (Deleted Field) | §18.12.1 |

| Attributes | Description |
|------------------------------|--|
| count (Deleted Fields Count) | Specifies how many deleted fields there are. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element’s content model ([CT_QueryTableDeletedFields](#)) is located in §A.2. end note]

18.12.4 queryTableField (QueryTable Field)

This element holds the properties related to a specific field or column in a query table.

| Parent Elements |
|-----------------------------|
| queryTableFields (§18.12.5) |

| Child Elements | Subclause |
|---|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Attributes | Description |
|---|---|
| clipped (Clipped Column) | <p>Specifies whether this field/column is currently clipped and thus not visible in the worksheet.</p> <p>[<i>Note</i>: this state might occur for example when a query table is defined near the edge of a worksheet or other object in the spreadsheet that can't be overwritten with external data. In this case some of the fields are displayed, but not all of them. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| dataBound (Data Bound Column) | <p>Specifies whether this column is a user-defined column or comes from the external data query. User defined columns shall be preserved during data refresh operations. User-defined columns are only supported on query tables that are attached to table objects.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| fillFormulas (Fill This Formula On Refresh) | <p>Specifies whether the formula in this field/column should be filled down on data refresh.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| id (Field Id) | <p>Specifies the unique identifier of the query table field.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| name (Name) | <p>Specifies the unique name of the query table field.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| rowNumbers (Row Numbers) | <p>true if this column contains the row numbers for the records returned.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| tableColumnId (Table Column Id) | <p>Specifies the unique identifier for the table column if the query table is attached to a table object rather than just a range in the sheet.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_QueryTableField](#)) is located in §A.2. *end note*]

18.12.5 queryTableFields (Query table fields)

This element is the collection for queryTableField elements.

| Parent Elements |
|------------------------------|
| queryTableRefresh (§18.12.6) |

| Child Elements | Subclause |
|------------------------------------|-----------|
| queryTableField (QueryTable Field) | §18.12.4 |

| Attributes | Description |
|----------------------|---|
| count (Column Count) | Specifies the number of columns there are in this query table. Includes both query-defined and user-defined columns, but not deleted columns. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTableFields](#)) is located in §A.2. *end note*]

18.12.6 queryTableRefresh (QueryTable Refresh Information)

This element contains information related to refreshing the query table.

| Parent Elements |
|-----------------------|
| queryTable (§18.12.2) |

| Child Elements | Subclause |
|---|------------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |
| queryTableDeletedFields (Deleted Fields) | §18.12.3 |
| queryTableFields (Query table fields) | §18.12.5 |
| sortState (Sort State) | §18.3.1.92 |

| Attributes | Description |
|--|---|
| fieldIdWrapped (Next Field Id Wrapped) | Whether or not the idFieldNext value wrapped around. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| headersInLastRefresh (Headers In Last Refresh) | Whether or not the Query Table had titles last refresh. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

| Attributes | Description |
|--|--|
| minimumVersion (Minimum Refresh Version) | <p>For backward compatibility with legacy versions of spreadsheet applications, this attribute specifies the minimum version of the application that is expected to correctly refresh the data in the query table without any problems.</p> <p>If this attribute is specified, an earlier version of a spreadsheet application should alert the user to the potential incompatibilities when a refresh is attempted.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> |
| nextId (Next field id) | <p>Specifies the next unique queryTableField (§18.12.4) id number available for assignment.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| preserveSortFilterLayout (Preserve Sort & Filter Layout) | <p>Specifies whether sorting, autofilter, layout, and table block formatting should be preserved for this query table across data refresh operations.</p> <p>If this attribute is set to <code>false</code>, the query table might be more or less recreated from scratch when data is refreshed. In this case, all user deleted or rearranged columns, user inserted columns that aren't bound to external data, and table column formatting are discarded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| unboundColumnsLeft (Columns Left) | <p>Specifies the number of extra columns included at the left end of the field array that aren't bound to external data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| unboundColumnsRight (Columns Right) | <p>Specifies the number of extra columns included at the right end of the Table that aren't bound to external data.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_QueryTableRefresh](#)) is located in §A.2. *end note*]

18.13 External Data Connections

SpreadsheetML allows for the definition of top level data connection objects that describe how to retrieve data from external sources. These connection objects are independent of the constructs in the spreadsheet application that display data such as tables, PivotTables, etc.

Some information about a connection is considered part of the connection's definition. Other information is not inherently part of the connection, but it describes the way the connection is to be used by the containing workbook. Note that in many cases, the spreadsheet application does not need knowledge of the command syntax for the external data source (e.g., database query language), and simply stores a command string that was created by a data provider API (e.g., an ODBC driver).

A connection's definition can be established in a standalone connection file for easier sharing and reuse, but this reference documentation deals with the XML representation for external data connections that is directly embedded within a SpreadsheetML document. This embedded representation is expected whenever external data is used, and ensures portability of the document and continued operation of the external query in the most cases.

18.13.1 connection (Connection)

This element contains both the definition of how to get at an external data source as well as information describing how the connection is used within the workbook. Specific constructs in a worksheet, such as OLAP formulas, QueryTables, or PivotTables make use of information in the connection to retrieve or refresh data based on default events or the user's explicit request.

| Parent Elements |
|------------------------|
| connections (§18.13.2) |

| Child Elements | Subclause |
|---|-----------|
| dbPr (Database Properties) | §18.13.3 |

| webPr (Web Query Properties) | §18.13.13 |

| Attributes | Description |
|---------------------------------|--|
| background (Background Refresh) | <p>Indicates whether the connection can be refreshed in the background (asynchronously). <code>true</code> if preferred usage of the connection is to refresh asynchronously in the background; <code>false</code> if preferred usage of the connection is to refresh synchronously in the foreground.</p> <p>This flag should be intentionally ignored in specific cases.</p> <p><i>[Example: An example of when the flag would be ignored is in the case of a connection to OLAP data on Microsoft SQL Server Analysis Services, where the connection is used by both a PivotTable and also by CUBE functions within the workbook. That connection will always be refreshed synchronously by the PivotTable and will always be refreshed</i></p> |

| Attributes | Description |
|--|--|
| | <p>asynchronously by the CUBE functions. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| credentials (Reconnection Method) | <p>Specifies the authentication method to be used when establishing (or re-establishing) the connection.</p> <p>The possible values for this attribute are defined by the ST_CredMethod simple type (§18.18.16).</p> |
| deleted (Deleted Connection) | <p>Indicates whether the associated workbook connection has been deleted. <code>true</code> if the connection has been deleted; otherwise, <code>false</code>.</p> <p>Deleted connections contain only the attributes <code>name</code> and <code>deleted=true</code>, all other information is removed from the SpreadsheetML file.</p> <p>If a new connection is created with the same name as a deleted connection, then the deleted connection is overwritten by the new connection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| description (Connection Description) | <p>Specifies the user description for this connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| id (Connection Id) | <p>Specifies The unique identifier of this connection.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| interval (Automatic Refresh Interval) | <p>Specifies the number of minutes between automatic refreshes of the connection. When this attribute is not present, the connection is not automatically refreshed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| keepAlive (Keep Connection Open) | <p><code>true</code> when the spreadsheet application should make efforts to keep the connection open. When <code>false</code>, the application should close the connection after retrieving the information. This corresponds to the <code>MaintainConnection</code> property of a <code>PivotCache</code> object.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| minRefreshableVersion (Minimum Version Required) | <p>For compatibility with legacy spreadsheet applications. This represents the minimum version # that is required to be able to correctly refresh the data connection. This attribute applies to connections that are used by a <code>QueryTable</code>.</p> |

| Attributes | Description |
|---|--|
| for Refresh) | The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype. |
| name (Connection Name) | <p>Specifies the name of the connection. Each connection shall have a unique name.</p> <p>When a connection has been marked as deleted and then a new connection is added with the same name, the deleted connection is replaced with the new connection.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| new (New Connection) | <p>true if the connection has not been refreshed for the first time; otherwise, false. This state can happen when the user saves the file before a query has finished returning.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| odcFile (Connection File) | <p>Specifies the full path to external connection file from which this connection was created. If a connection fails during an attempt to refresh data, and reconnectionMethod=1, then the spreadsheet application will try again using information from the external connection file instead of the connection object embedded within the workbook.</p> <p>This is a benefit for data source and spreadsheetML document manageability. If the definition in the external connection file is changed (e.g., because of a database server name change), then the workbooks that made use of that connection will fail to connect with their internal connection information, and reload the new connection information from this file.</p> <p>This attribute is cleared by the spreadsheet application when the user manually edits the connection definition within the workbook. Can be expressed in URI or system-specific file path notation.</p> <p>[Note: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| onlyUseConnection File (Only Use Connection File) | <p>Indicates whether the spreadsheet application should always and only use the connection information in the external connection file indicated by the odcFile attribute when the connection is refreshed.</p> <p>If false, then the spreadsheet application should follow the procedure indicated by the reconnectionMethod attribute described below.</p> <p>Applies only to OLE DB and ODBC connections, this attribute is ignored for other types of</p> |

| Attributes | Description |
|--|--|
| | <p>connections.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| reconnectionMethod (Reconnection Method) | <p>Specifies what the spreadsheet application should do when a connection fails.</p> <p>The values are as follows:</p> <p>1 = As required: On refresh use the existing connection information. If the existing information cannot be used to establish a connection, get updated connection information, if available from the external connection file.</p> <p>2 = Always: On every refresh get updated connection information from the external connection file, if available, and use that instead of the existing connection information. In this case the data refresh will fail if the external connection file is unavailable.</p> <p>3 = Never: Never get updated connection information from the external connection file even if it is available and even if the existing connection information cannot be used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| refreshedVersion (Last Refresh Version) | <p>For backward compatibility purposes, this attribute indicates the version of the spreadsheet application that last refreshed the connection.</p> <p>This attribute applies to connections that are used by a query table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype.</p> |
| refreshOnLoad (Refresh on Open) | <p>true if this connection should be refreshed when opening the file; otherwise, false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| saveData (Save Data) | <p>true if the external data fetched over the connection to populate a table is to be saved with the workbook; otherwise, false.</p> <p>This exists for data security purposes - if no external data is saved in (or "cached") in the workbook, then current user credentials can be required every time to retrieve the relevant data, and people won't see the data the workbook author had last been using before saving the file.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| savePassword (Save Password) | <p>true if the password is to be saved as part of the connection string; otherwise, False.</p> |

| Attributes | Description |
|-----------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| singleSignOnId (SSO Id) | <p>Identifier for Single Sign On (SSO) used for authentication between an intermediate spreadsheetML server and the external data source.</p> <p>[<i>Note</i>: Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/spptsdk/html/cSSOReturnCodes_SV01001109.asp <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| sourceFile (Source Database File) | <p>Used when the external data source is file-based. When a connection to such a data source fails, the spreadsheet application attempts to connect directly to this file. Can be expressed in URI or system-specific file path notation.</p> <p>[<i>Note</i>: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| type (Database Source Type) | <p>Specifies the data source type.</p> <p>Values are as follows:</p> <ol style="list-style-type: none"> 1. ODBC-based source 2. DAO-based source 3. File based database source 4. Web query 5. OLE DB-based source 6. Text-based source 7. ADO record set 8. DSP <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model (CT_Connection) is located in §A.2. *end note*]

18.13.2 connections (Connections)

This element exists when there are one or more connections in the workbook. It is a container for the individual connection objects.

| Parent Elements |
|--|
| Root element of SpreadsheetML Connections part |

| Child Elements | Subclause |
|-------------------------|-----------|
| connection (Connection) | §18.13.1 |

[Note: The W3C XML Schema definition of this element's content model ([CT Connections](#)) is located in §A.2. *end note*]

18.13.3 dbPr (Database Properties)

This element stores all properties associated with an ODBC or OLE DB external data connection.

[Example:

Data connectivity can use a number of different technologies. The following is one example XML fragment defining an OLE DB connection and the associated dbPr element:

```
<connection id="2"
  odcFile="C:\My Documents\My Data Sources\Northwind Orders.odc" keepAlive="1"
  name="Northwind Orders" description="northwind" type="5" refreshedVersion="3">
  <dbPr connection="Provider=SQLOLEDB.1;Persist
    Security Info=True;Initial Catalog=Northwind;Data Source=dataserver1;Use
    Procedure for Prepare=1;Auto Translate=True;Packet Size=4096;Workstation
    ID=LOCAL_MACHINE_NAME;Use Encryption for Data=False;Tag with column
    collation when possible=False"
    command=""Northwind"."dbo"."Orders""
    commandType="3"/>
</connection>
```

end example]

| Parent Elements |
|-----------------------|
| connection (§18.13.1) |

| Attributes | Description |
|---------------------------|--|
| command (Command Text) | The string containing the database command to pass to the data provider API that will interact with the external source in order to retrieve data. These strings can be constructed in a variety of ways (from simple UIs built into the spreadsheet application for browsing and choosing tables and fields, to external applications providing user interface to build up complex queries, to advanced users editing text queries). The spreadsheetML application need not understand the command syntax; it can simply pass |

| Attributes | Description |
|---|---|
| | <p>the command string to the data provider API in order to retrieve the latest external data.</p> <p><i>[Example:</i> Data connectivity can use a number of different technologies. The following is one example of an ODBC command string of <code>commandType=2</code> (for a Microsoft SQL Server database):</p> <pre>command="SELECT Orders.OrderID, Orders.OrderDate, Orders.ShipName, Orders.ShipAddress, Orders.ShipCity, Orders.ShipRegion, Orders.ShipPostalCode, Orders.ShipCountry_x000d__x000a_FROM Northwind.dbo.Orders Orders_x000d__x000a_WHERE (Orders.ShipCountry=?)"</pre> <p>Some characters in this string have been escaped - for more information on the escaping scheme, please refer to the <code>ST_Xstring</code> simple type definition. <i>end example]</i></p> <p><i>[Note:</i> the "?" syntax in the string is something that the ODBC data provider is aware of and might replace with a parameter before execution. <i>end note]</i></p> <p><i>[Example:</i> Data connectivity can use a number of different technologies. The following is one example of an OLE DB command string of <code>commandType=3</code> (for an Oracle database):</p> <pre>command="&quot;TESTDB&quot;;.&quot;ShippersTable&quot;;"</pre> <p><i>end example]</i></p> <p><i>[Note:</i> Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_statements.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcsql_minimum_grammar.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/oledbusing_commands.asp <p><i>end note]</i></p> <p>The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19).</p> |
| commandType (OLE DB Command Type) | <p>Specifies the OLE DB command type.</p> <p>Supported values are as follows:</p> <ol style="list-style-type: none"> 1. Query specifies a cube name 2. Query specifies a SQL statement 3. Query specifies a table name 4. Query specifies that default information has been given, and it is up to the provider |

| Attributes | Description |
|---|---|
| | <p>how to interpret.</p> <p>5. Query is against a web based List Data Provider.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| <p>connection (Connection String)</p> | <p>The connection string is used to make contact with an OLE DB or ODBC data source. These can be constructed in a variety of ways (from UI wizards built into the data provider code, to external query applications, to advanced users editing text files). The spreadsheetML application need not understand the connection syntax at all; it can simply pass the command string to the data provider API in order to re-establish a connection with the external data source.</p> <p>[Example: ODBC connection string to a database:</p> <pre>connection="DRIVER=SQL Server;SERVER=example_server;UID=example_useralias;APP=Microsof t Office 2007;WSID=user_alias;Trusted_Connection=Yes"</pre> <p><i>end example]</i></p> <p>[Example: of an OLE DB connection string to an Oracle database:</p> <pre>connection="Provider=OraOLEDB.Oracle.1;Password=example_passwor d;Persist Security Info=True;User ID=example_useralias;Data Source=example_server;Extended Properties="""</pre> <p><i>end example]</i></p> <p>[Note: Data connectivity can use a number of different technologies. A few examples of potential values stored in this attribute can be found at:</p> <ul style="list-style-type: none"> • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/dasdkodbcoverview.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbcsql/od_odbc_d_4x4k.asp • http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdreforacleprovspec.asp <p><i>end note]</i></p> <p>Connection strings syntaxes are specific to individual ODBC or OLE DB data provider drivers.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| <p>serverCommand (Command Text)</p> | <p>Specifies a second command text string that is persisted when PivotTable server-based page fields are in use.</p> |

| Attributes | Description |
|------------|---|
| | <p>For ODBC connections, serverCommand is usually a broader query than command (no WHERE clause is present in the former). Based on these 2 commands, parameter UI can be populated and parameterized queries can be constructed.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_DbPr](#)) is located in §A.2. *end note*]

18.13.4 m (No Value)

This element is present when tables in a web query are missing.

| Parent Elements |
|-------------------|
| tables (§18.13.9) |

[Note: The W3C XML Schema definition of this element's content model ([CT_TableMissing](#)) is located in §A.2. *end note*]

18.13.5 olapPr (OLAP Properties)

This element contains all the properties needed for an OLAP data connection. OLE DB for OLAP is the data provider, and OLAP connections contain both the dbPr and olapPr child elements.

[Example:

Data connectivity can use a number of different technologies. The following is an example of a connection to an SAP BW OLAP data source:

```
<connection id="1" odcFile="C:\My Documents\My Data Sources\$_INFOCUBE.odc"
  keepAlive="1" name="SAP demo cube" description="SAP DemoCube" type="5"
  refreshedVersion="3" background="1">
  <dbPr connection="Provider=MDrmSap.2;Data Source=BI2;User
    ID=TESTUSER;Location=TESTSERVERNAME;Cache Authentication=False;Encrypt
    Password=False;Integrated Security="";Mask Password=False;Persist
    Encrypted=False;Persist Security Info=True;Impersonation
    Level=Anonymous;Mode=Read;Protection Level=None;Extended
    Properties="SFC_CLIENT=800;";Initial Catalog=$_INFOCUBE"
    command="$0D_DECU" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000" serverFill="0"
    serverNumberFormat="0" serverFont="0" serverFontColor="0"/>
</connection>
```

end example]

[*Example:*

Data connectivity can use a number of different technologies. The following is an example of a connection to a Microsoft SQL Server Analysis Services OLAP data source:

```
<connection id="1"
  odcFile="C:\My Documents\My Data Sources\Adventure Works DW.odc" keepAlive="1"
  name="Adventure Works DW" type="5" refreshedVersion="3" background="1">
  <dbPr connection="Provider=MSOLAP.3;Cache Authentication=False;Persist
Security Info=True;Initial Catalog=Adventure Works
  DW;Data Source=DATASERVER1;Impersonation
  Level=Impersonate;Mode=ReadWrite;Protection Level=Pkt Privacy;Auto Synch
  Period=20000;Default Isolation Mode=0;Default MDX Visual Mode=0;MDX
  Compatibility=1;MDX Unique Name Style=0;Non Empty
  Threshold=0;SQLQueryMode=Calculated;Safety Options=2;Secured Cell
  Value=0;SOURCE_DSN_SUFFIX=&quot;;SQL Compatibility=0;Compression Level=0;Real Time
  Olap=False;Packet Size=4096" command="Adventure Works" commandType="1"/>
  <olapPr sendLocale="1" rowDrillCount="1000"/>
</connection>
```

end example]

[*Note:* Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/oledb/htm/dasdkoledboverview.asp> *end note]*

| Parent Elements |
|-----------------------|
| connection (§18.13.1) |

| Attributes | Description |
|---|--|
| local (Local Cube) | Flag indicating whether we should get data from the local cube on refresh versus the original data source. true if a local cube has been created for OLAP data, and it should be used instead of the server. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| localConnection (Local Cube Connection) | Specifies a connection string to use when a local cube is available. This is used when local is set to true. [<i>Example:</i> |

| Attributes | Description |
|--|--|
| | <pre><olapPr local="true" localConnection="OLEDB;Provider=MSOLAP;Data Source=C:\Data\DataCube.cub" ></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| localRefresh (Local Refresh) | <p>Flag indicating whether we should refresh the local cube from the original data source. When true, the original OLAP data source is queried each time the user explicitly refreshes the data in the application, and a new local cube is constructed from this query.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rowDrillCount (Drill Through Count) | <p>Maximum number of drill-through rows to return when the user drills through an aggregate value in a PivotTable.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| sendLocale (Send Locale to OLAP) | <p>When true, the spreadsheetML app should send the user interface locale ID to the OLAP provider to retrieve localized member names and properties, etc. When false, no locale ID is expected.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| serverFill (OLAP Fill Formatting) | <p>When true a PivotTable based on an OLAP source should format the data and aggregate cells in the PivotTable view using the background color from the OLAP source if this information is available. When false, OLAP server background fill colors are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| serverFont (OLAP Server Font) | <p>When true, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font from the OLAP source (e.g., Arial or Tahoma). When false, OLAP server fonts are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| serverFontColor (OLAP Font Formatting) | <p>When true a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the font color from the OLAP source. When false, OLAP server font colors are ignored, and standard formatting rules within the worksheet are followed.</p> |

| Attributes | Description |
|---|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| serverNumberFormat (OLAP Number Format) | <p>When true, a PivotTable based on OLAP source should format the data and aggregate cells in the PivotTable view using the number format from the OLAP source. When false, OLAP server number formats are ignored, and standard formatting rules within the worksheet are followed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_OlapPr](#)) is located in §A.2. *end note*]

18.13.6 parameter (Parameter Properties)

This element stores properties about any parameters used with external data connections. Parameters are used to change the query executed externally and cause different data to be retrieved into the workbook. The type of parameter used – see `ST_parameterType` (§18.18.54) – determines whether the user is prompted for a value before data is refreshed, or the value is pulled from a cell in the workbook, or whether the same value should be used until explicitly changed in the data connection. Parameters are permitted for ODBC and web queries.

[Example:

Data connectivity can use a number of different technologies. The following is an example of XML defining a connection to a Microsoft Access database, with a parameter based on the value in cell C1 on the first sheet.

```
<connection id="1" name="Connection" type="1" refreshedVersion="2"
  background="1" saveData="1">
  <dbPr connection="DSN=MS Access
    Database;DBQ=C:\Desktop\db1.mdb;DefaultDir=C:\Desktop;DriverId=25;FIL=MS
    Access;MaxBufferSize=2048;PageTimeout=5;" command="SELECT Table1.Field1,
    Table1.Field2_x000d__x000a_FROM `C:\Desktop\db1`.Table1
    Table1_x000d__x000a_WHERE (Table1.Field2=?)" />
  <parameters count="1">
    <parameter name="user specified value" sqlType="4" parameterType="cell"
      cell="Sheet1!$C$1" />
  </parameters>
</connection>
```

end example]

Note that the command string in the `dbPr` element contains a "?" character. This character serves as a parameter marker.

[*Note:* Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/htm/odbcstatement_parameters.asp *end note*]

| Parent Elements |
|-----------------------|
| parameters (§18.13.7) |

| Attributes | Description |
|----------------------------------|---|
| boolean (Boolean) | <p>Boolean value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| cell (Cell Reference) | <p>Cell reference indicating which cell's value to use for the query parameter. Used only when parameterType = cell.</p> <p>[<i>Example:</i></p> <p style="padding-left: 40px;"><code><Parameter parameterType="cell" cell="Sheet1!\$C\$1"></code></p> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| double (Double) | <p>Non-integer numeric value to use as the query parameter. Used only when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema double datatype.</p> |
| integer (Integer) | <p>Integer value to use as the query parameter. Used when parameterType = value.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p> |
| name (Parameter Name) | <p>The name of the parameter.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| parameterType (Parameter Type) | <p>Type of parameter used. If the parameterType=value, then the value from boolean, double, integer, or string are used. In this case, it is expected that only one of {boolean, double, integer, or string} is specified.</p> <p>The possible values for this attribute are defined by the ST_ParameterType simple type (§18.18.54).</p> |
| prompt (Parameter Prompt String) | <p>Prompt string for the parameter. Presented to the spreadsheet user along with input UI to collect the parameter value before refreshing the external data. Used only when</p> |

| Attributes | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--|---|-----|---------------------|-----|-------------------|-----|----------|-----|------------------|----|--------------|----|-----------|----|---------|----|-------------|----|------------|----|-------------------|----|---------------|----|------------|----|-----------------|---|------------------|---|----------|---|-------------|---|-------------|---|-------------|---|--------------|---|-----------|
| | <p>parameterType = prompt.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| refreshOnChange (Refresh on Change) | <p>Flag indicating whether the query should automatically refresh when the contents of a cell that provides the parameter value changes. If true, then external data is refreshed using the new parameter value every time there's a change. If false, then external data is only refreshed when requested by the user, or some other event triggers refresh (e.g., workbook opened).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| sqlType (SQL Data Type) | <p>SQL data type of the parameter. | | 105 | SQL_INTERVAL_MINUTE |
| | 106 | SQL_INTERVAL_SECOND |
| | 107 | SQL_INTERVAL_YEAR_TO_MONTH |
| | 108 | SQL_INTERVAL_DAY_TO_HOUR |
| | 109 | SQL_INTERVAL_DAY_TO_MINUTE |
| | 110 | SQL_INTERVAL_DAY_TO_SECOND |
| | 111 | SQL_INTERVAL_HOUR_TO_MINUTE |
| | 112 | SQL_INTERVAL_HOUR_TO_SECOND |
| | 113 | SQL_INTERVAL_MINUTE_TO_SECOND |
| | The possible values for this attribute are defined by the W3C XML Schema int datatype. | |
| string (String) | String value to use as the query parameter. Used only when parameterType = value. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). | |

[Note: The W3C XML Schema definition of this element's content model ([CT_Parameter](#)) is located in §A.2. *end note*]

18.13.7 parameters (Query Parameters)

This element serves as a collection of parameters for an ODBC or web query.

| Parent Elements |
|-----------------------|
| connection (§18.13.1) |

| Child Elements | Subclause |
|----------------------------------|-----------|
| parameter (Parameter Properties) | §18.13.6 |

| Attributes | Description |
|-------------------------|---|
| count (Parameter Count) | <p>The number of parameters used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Parameters](#)) is located in §A.2. *end note*]

18.13.8 s (Character Value)

This element is used to specify an HTML table to import by name. If the tables are not named, they shall be specified with the `<x v="[index]">` syntax instead.

| Parent Elements |
|--|
| metadataStrings (§18.9.9); tables (§18.13.9) |

| Attributes | Description |
|------------|--|
| v (Value) | <p>The name of the table to retrieve when the web query is refreshed. This corresponds to the string used for the id attribute of the HTML <code><table></code> tag.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_XStringElement](#)) is located in §A.2. *end note*]

18.13.9 tables (Tables)

This element serves as the collection of tables to be returned via a web query data connection. Tables are then most commonly referenced by `<x>` via their indices (in order of the `<Table>` tags in the HTML page).

| Parent Elements |
|-------------------|
| webPr (§18.13.13) |

| Child Elements | Subclause |
|------------------------|-------------|
| m (No Value) | §18.13.4 |
| s (Character Value) | §18.13.8 |
| x (Shared Items Index) | §18.10.1.97 |

| Attributes | Description |
|-------------------------|---|
| count (Count of Tables) | <p>Number of tables to pull data from when refreshing from a web query.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Tables](#)) is located in §A.2. *end note*]

18.13.10 textField (Text Import Field Settings)

This element specifies field settings for text import.

| Parent Elements |
|------------------------|
| textFields (§18.13.11) |

| Attributes | Description |
|---------------------|--|
| position (Position) | <p>The character position the field starts at for fixed-length fields. The index is 0-based. If this attribute does not exist, position=0 is assumed. Subsequent textField elements or carriage returns in the text stream serve to denote endpoints for text fields.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| type (Field Type) | <p>Specifies the field Type. When text is imported into cells in the worksheet, the data in the cells are converted to the field type defined here.</p> <p>Types can be specified by the user, or determined algorithmically via heuristics and text analysis.</p> <p>The possible values for this attribute are defined by the ST_ExternalConnectionType simple type (§18.18.27).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TextField](#)) is located in §A.2. *end note*]

18.13.11 textFields (Fields)

This element denotes a set of fields to retrieve from a text file. Contains 1 or more textField elements.

| Parent Elements |
|--------------------|
| textPr (§18.13.12) |

| Child Elements | Subclause |
|--|-----------|
| textField (Text Import Field Settings) | §18.13.10 |

| Attributes | Description |
|-------------------------|---|
| count (Count of Fields) | <p>Number of distinct fields to retrieve.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TextFields](#)) is located in §A.2. *end note*]

18.13.12 textPr (Text Import Settings)

This element contains all of the text import settings.

[Example: Here's an example of the XML for a text connection:

```
<connection id="1" name="text data" type="6" refreshedVersion="3" background="1"
  saveData="1">
  <textPr prompt="0" characterSet="IBM437" sourceFile="C:\Desktop\text data.txt"
    delimiter="|">
    <textFields count="5">
      <textField/>
      <textField type="text" position="7"/>
      <textField type="text" position="28"/>
      <textField position="36"/>
      <textField type="text" position="41"/>
    </textFields>
  </textPr>
</connection>
```

example]

| Parent Elements |
|-----------------------|
| connection (§18.13.1) |

| Child Elements | Subclause |
|---------------------|-----------|
| textFields (Fields) | §18.13.11 |

| Attributes | Description | | | | | | | | | | | | |
|---|--|-----------------------------------|-------------------------------------|-----------------------------------|-------------------------------------|---------------|------------------------|--------|-------|-------|--------|------------|----------------------|
| characterSet (Character Set) | <p>Name of the character set associated with the text file. Values for this attribute are restricted to the names and aliases listed in the IANA CHARACTER SETS listing found at http://www.iana.org/assignments/character-sets.</p> <p>[<i>Note:</i> When reading this value, if a system does not support a particular character set, the application is allowed to decide what is the best course of fallback action. <i>end note</i>]</p> <p>If this attribute is not present then the codePage attribute are used.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> | | | | | | | | | | | | |
| comma (Comma is Delimiter) | <p>Flag indicating whether to treat comma characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> | | | | | | | | | | | | |
| consecutive (Consecutive Delimiters) | <p>Flag indicating whether consecutive delimiters should be treated as just one delimiter. If this flag is true than it's possible or even likely that some rows will return more fields than others, and these fields will always fill cells in the worksheet from left to right.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> | | | | | | | | | | | | |
| decimal (Decimal Separator) | <p>The decimal separator character. This and the thousands attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used.</p> <p>The following table shows the results when you import text into a spreadsheet application using various separators. Numeric results are displayed in the rightmost column.</p> <table><tr><th>System decimal separator</th><th>System thousands separator</th><th>Text file decimal separator value</th><th>Text file thousands Separator value</th><th>Text imported</th><th>Cell value (data type)</th></tr><tr><td>Period</td><td>Comma</td><td>Comma</td><td>Period</td><td>123.123,45</td><td>123,123.45 (numeric)</td></tr></table> | System decimal separator | System thousands separator | Text file decimal separator value | Text file thousands Separator value | Text imported | Cell value (data type) | Period | Comma | Comma | Period | 123.123,45 | 123,123.45 (numeric) |
| System decimal separator | System thousands separator | Text file decimal separator value | Text file thousands Separator value | Text imported | Cell value (data type) | | | | | | | | |
| Period | Comma | Comma | Period | 123.123,45 | 123,123.45 (numeric) | | | | | | | | |

| Attributes | Description | | | | | |
|-------------------------------|---|--------|--------|--------|------------|----------------------|
| | Period | Comma | Comma | Comma | 123.123,45 | 123.123,45 (text) |
| | Comma | Period | Comma | Period | 123,123.45 | 123,123.45 (numeric) |
| | Period | Comma | Period | Comma | 123 123.45 | 123 123.45 (text) |
| | Period | Comma | Period | Space | 123 123.45 | 123,123.45 (numeric) |
| | Strings values of this attribute are expected to be one character in length. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). | | | | | |
| delimited (Delimited File) | true if the file is Tab or character delimited. false if the file should be parsed according to fixed length fields. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. | | | | | |
| delimiter (Custom Delimiter) | User-specified character to be treated as a field delimiter. Only single characters are supported. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). | | | | | |
| fileType (File Type) | Ignorable attribute with enum value that defined by ST_FileType. Determines the kind of character set to use during import. Only one of fileType and characterSet or codePage shall be specified for a textPr. The possible values for this attribute are defined by the ST_FileType simple type (§18.18.29). | | | | | |
| firstRow (First Row) | Indicates at what row of the file to start the data import. All unsignedInt values are permitted, although it's possible that firstRow is higher than the number of rows in the text file, in which case no data is imported. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. | | | | | |
| prompt (Prompt for File Name) | Flag indicating whether the user wants to be prompted for the file name on refresh. If false, then the user is not prompted. If true or not present, then the user is prompted. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. | | | | | |
| qualifier (Qualifier) | Character used as the text string qualifier. The possible values for this attribute are defined by the ST_Qualifier simple type | | | | | |

| Attributes | Description |
|--|--|
| | (§18.18.61). |
| semicolon (Semicolon is Delimiter) | <p>Flag indicating whether to treat semicolon characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| sourceFile (Source File Name) | <p>Path to the text file to use to import external data. Can be expressed in URI or system-specific file path notation.</p> <p>[<i>Note</i>: Applications can decide what forms of URI they support, and whether system-specific file path notations are supported. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| space (Space is Delimiter) | <p>Flag indicating whether to treat space characters as field delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| tab (Tab as Delimiter) | <p>Flag indicating whether to treat tab characters as field delimiters. If <code>false</code>, then tabs will not be used as delimiters. If <code>true</code> or not present, then they are used as delimiters.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| thousands (Thousands Separator) | <p>The thousands separator character. This and the decimal attribute are used only when data in the text file contains decimal and thousands separators that are different from those used on the computer, due to a different language setting being used. Please refer to the decimal attribute description above for a Table describing the behavior.</p> <p>Strings values of this attribute are expected to be one character in length.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TextPr](#)) is located in §A.2. *end note*]

18.13.13 webPr (Web Query Properties)

This element specifies the properties for a web query source. A web query will retrieve data from HTML tables, and can also supply HTTP "Get" parameters to be processed by the web server in generating the HTML by including the parameters and parameter elements.

Here's an example of a web query connection:

[*Example*:

```

<connection id="1" name="Connection" type="4" refreshedVersion="0"
  background="1" saveData="1">
  <webPr sourceData="1" parsePre="1" consecutive="1"
    url="http://ServerName/Image%20Library/Forms/AllItems.aspx" htmlTables="1">
    <tables count="1">
      <s v="contentthumbnail"/>
    </tables>
  </webPr>
</connection>

```

end example]

| Parent Elements |
|-----------------------|
| connection (§18.13.1) |

| Child Elements | Subclause |
|-----------------|-----------|
| tables (Tables) | §18.13.9 |

| Attributes | Description |
|---|--|
| consecutive (Consecutive Delimiters) | <p>Flag indicating whether consecutive delimiters should be treated as just one delimiter.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| editPage (Edit Query URL) | <p>The URL of the user-facing web page showing the web query data. This URL is persisted in the case that sourceData="true" and url has been redirected to reference an XML file. Then the user-facing page can be shown in the UI, and the XML data can be retrieved behind the scenes.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| firstRow (Use First Row) | <p>Flag indicating whether to parse all tables inside a PRE block with the same width settings as the first row.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| htmlFormat (HTML Formatting Handling) | <p>How to handle formatting from the HTML source when bringing web query data into the worksheet. Relevant when sourceData is True.</p> <p>Values are as follows:</p> <ol style="list-style-type: none"> 1. None - no formatting at all 2. RTF - honor just rich text formatting 3. All - honor all html formatting. |

| Attributes | Description |
|-------------------------------------|--|
| | The possible values for this attribute are defined by the ST_HtmlFmt simple type (§18.18.41). |
| htmlTables (HTML Tables Only) | <p>Flag indicating whether web queries should only work on HTML tables.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| parsePre (Parse PRE) | <p>Flag indicating whether data contained within HTML <PRE> tags in the web page is parsed into columns when you import the page into a query table.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| post (Web Post) | <p>Returns or sets the string used with the post method of inputting data into a web server to return data from a web query.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| sourceData (Import XML Source Data) | <p>Flag indicating that XML source data should be imported instead of the HTML table itself.</p> <p>Used when a web query exists to an HTML table with the following attribute.</p> <p style="text-align: center;"><TABLE ... o:WebQuerySourceHref="http://..." ... > ... </TABLE></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| textDates (Dates as Text) | <p>Flag indicating whether dates should be imported into cells in the worksheet as text rather than dates.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| url (URL) | <p>URL to use to refresh external data.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| xl2000 (Refreshed in Excel 2000) | <p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was refreshed in a spreadsheet application newer than or equal to Microsoft Excel 2000.</p> <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| xl97 (Created in Excel 97) | <p>This flag exists for backward compatibility with older existing spreadsheet files, and is set to true if this web query was created in Microsoft Excel 97.</p> |

| Attributes | Description |
|------------------|--|
| | <p>This is an optional attribute that can be ignored.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| xml (XML Source) | <p>true if the web query source is XML (versus HTML), otherwise false.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT WebPr](#)) is located in §A.2. *end note*]

18.14 Supplementary Workbook Data

External links are used when linking the workbook to other workbooks or external data. The most frequent feature for linking a workbook to other workbooks is through the use of formulas. In this case the formula references a range or defined name in another workbook. Hyperlinks on cells and other spreadsheet objects are also considered an external link. Object-linking technologies are yet another technology used to link the workbook to another object. [Example: KParts or OLE. *end example*] Finally, Dynamic Data Exchange, or DDE, servers can be used to access external data. DDE servers are accessed through formulas in the workbook.

External links are saved with the target source in a relationship file so that external resources are easily discoverable in lightweight relationship XML rather than deep in the application's XML.

For a workbook consumer.xlsx that makes use of data in another workbook called data.xlsx, the following XML would exist in consumer.xlsx to describe the external link:

[Example:

```
<Relationships xmlns="...">
  <Relationship Id="rId1" Type=".../externalLinkPath" Target="data.xlsx"
    TargetMode="External"/>
</Relationships>
```

end example]

And the following XML would exist to describe cached data retrieved from the external workbook:

[Example:

```

<externalLink xmlns="...">
  <externalBook xmlns:r="..." r:id="rId1">
    <sheetNames>
      <sheetName val="Sheet1"/>
      <sheetName val="Sheet2"/>
      <sheetName val="Sheet3"/>
    </sheetNames>
    <sheetDataSet>
      <sheetData sheetId="0"/>
      <sheetData sheetId="1"/>
      <sheetData sheetId="2">
        <row r="11">
          <cell r="B11">
            <v>47</v>
          </cell>
        </row>
        <row r="12">
          <cell r="B12">
            <v>19</v>
          </cell>
        </row>
        <row r="13">
          <cell r="B13">
            <v>38</v>
          </cell>
        </row>
      </sheetData>
    </sheetDataSet>
  </externalBook>
</externalLink>

```

end example]

The Supplementary Workbook Data section of SpreadsheetML is complimentary to the External Data Connections (§18.13) section in maintaining all the information about external information that impacts the workbook.

18.14.1 cell (External Cell Data)

This element is used to store cached values from external sources such as other workbooks. Formulas from external cells are not stored in the consuming workbook. Also, for this context, the attribute `t` cannot have a value of `inlineStr`. Rich text is not supported in this context either.

| Parent Elements |
|-----------------|
| row (§18.14.12) |

| Child Elements | Subclause |
|----------------|------------|
| v (Cell Value) | §18.3.1.96 |

| Attributes | Description |
|---------------------|---|
| r (Reference) | <p>Describes the cell location in the external book.</p> <p>[Example:</p> <pre><cell r="B12"> <v>74</v> </cell></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p> |
| t (Type) | <p>Indicates the data type of the cell value.</p> <p>The possible values for this attribute are defined by the ST_CellType simple type (§18.18.11).</p> |
| vm (Value Metadata) | <p>The index of the cell's value metadata, if any exists.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalCell](#)) is located in §A.2. end note]

18.14.2 ddeItem (DDE Item definition)

This element represents a DDE item.

| Parent Elements |
|---------------------|
| ddeItems (§18.14.3) |

| Child Elements | Subclause |
|--------------------------|-----------|
| values (DDE Name Values) | §18.14.19 |

| Attributes | Description |
|----------------------------------|--|
| advise (Advise) | Specifies whether the DDE server should notify the application when the external data changes. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| name (DDE Name) | Specifies the DDE item name. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| ole (Object Linking TechnologyE) | Set to <code>true</code> if this item uses an object linking technology. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| preferPic (Data is an Image) | Set to <code>true</code> if data from this DDE item is an image format. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_DdeItem](#)) is located in §A.2. *end note*]

18.14.3 ddeItems (DDE Items Collection)

This element serves as a collection for ddeItem elements.

| Parent Elements |
|--------------------|
| ddeLink (§18.14.4) |

| Child Elements | Subclause |
|-------------------------------|-----------|
| ddeItem (DDE Item definition) | §18.14.2 |

[Note: The W3C XML Schema definition of this element's content model ([CT_DdeItems](#)) is located in §A.2. *end note*]

18.14.4 ddeLink (DDE Connection)

This element represents a connection to an external Dynamic Data Exchange (DDE) server. DDE is a method of sending data between applications using Windows messages according to a documented protocol that has been stable since about 1990.

The hierarchy of names defined by a DDE server is Application, Topics, and Items. Topics often correspond to units such as files or documents or database names, and Items refer to subsets of the data such as cell ranges, rows, fields, columns. DDE items can have multiple values as well.

[Example:

Data connectivity can use a number of different technologies. The following is just one example of a spreadsheetML fragment describing the product Microsoft Excel being used as a DDE server to provide data to the current spreadsheet document:

```
<ddeLink xmlns:r="..." ddeService="excel" ddeTopic="[ddesource.xls]Sheet1">
  <ddeItems>
    <ddeItem name="R1C1" advise="1"/>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

| Parent Elements |
|-------------------------|
| externalLink (§18.14.8) |

| Child Elements | Subclause |
|---------------------------------|-----------|
| ddeItems (DDE Items Collection) | §18.14.3 |

| Attributes | Description |
|---------------------------------|--|
| ddeService (Service name) | Service name (i.e., application name) for the DDE connection. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |
| ddeTopic (Topic for DDE server) | Describes something for the DDE application to which the channel pertains— usually a document of that application. This is a required attribute. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_DdeLink](#)) is located in §A.2. end note]

18.14.5 definedName (Defined Name)

This element contains information about a named range in an external workbook.

| Parent Elements |
|-------------------------|
| definedNames (§18.14.6) |

| Attributes | Description |
|----------------------|--|
| name (Defined Name) | <p>The defined name. This attribute is required.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| refersTo (Refers To) | <p>Name range definition string.</p> <p><i>[Example:</i></p> <pre><definedNames> <definedName name="namedrange" refersTo="='Sheet1'!\$D\$5:\$D\$10"/> </definedNames></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |
| sheetId (Sheet Id) | <p>The index of the worksheet that the named range applies to for named ranges that are scoped to a particular worksheet rather than the full workbook. This attribute is optional.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalDefinedName](#)) is located in §A.2. *end note*]

18.14.6 definedNames (Named Links)

This element is a collection of the defined names associated with the supporting workbook.

| Parent Elements |
|-------------------------|
| externalBook (§18.14.7) |

| Child Elements | Subclause |
|----------------------------|-----------|
| definedName (Defined Name) | §18.14.5 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalDefinedNames](#)) is located in §A.2. *end note*]

18.14.7 externalBook (External Workbook)

This element represents an external workbook which is supplying data to the current workbook.

| Parent Elements |
|-------------------------|
| externalLink (§18.14.8) |

| Child Elements | Subclause |
|--|-----------|
| definedNames (Named Links) | §18.14.6 |
| sheetDataSet (Cached Worksheet Data) | §18.14.14 |
| sheetNames (Supporting Workbook Sheet Names) | §18.14.16 |

| Attributes | Description |
|---|--|
| id (Relationship to supporting book file path) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the worksheet XML file in the current spreadsheetML document ZIP archive that makes use of this externalbook. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ExternalBook](#)) is located in §A.2. *end note*]

18.14.8 externalLink (External Reference)

This element is a container for specific types of external links.

| Parent Elements |
|---|
| Root element of SpreadsheetML External Workbook References part |

| Child Elements | Subclause |
|---|-----------|
| ddeLink (DDE Connection) | §18.14.4 |
| externalBook (External Workbook) | §18.14.7 |
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Child Elements | Subclause |
|--|-----------|
| oleLink (Generic Object Link Connection) | §18.14.11 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ExternalLink](#)) is located in §A.2. *end note*]

18.14.9 oleItem (Object Link Item)

This element represents a single link within the object referenced by the parent element.

| Parent Elements |
|----------------------|
| oleItems (§18.14.10) |

| Attributes | Description |
|--------------------------------|---|
| advise (Advise) | Set to <code>true</code> if the linked object should notify the application when the external data changes. Default value is <code>false</code> . The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| icon (Icon) | Set to <code>true</code> if the linked object is represented by an icon. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| name (Object Name) | The linked object's name. The possible values for this attribute are defined by the <code>ST_Xstring</code> simple type (§22.9.2.19). |
| preferPic (Object is an Image) | Set to <code>true</code> if the linked object is represented by an image. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_OleItem](#)) is located in §A.2. *end note*]

18.14.10 oleItems (Object Link Items)

This element is a collection of items within the link specified by the parent element.

| Parent Elements |
|---------------------|
| oleLink (§18.14.11) |

| Child Elements | Subclause |
|----------------------------|-----------|
| oleItem (Object Link Item) | §18.14.9 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OleItems](#)) is located in §A.2. *end note*]

18.14.11 oleLink (Generic Object Link Connection)

This element represents an external link to an embedded object, specified by a progID/object pair. The type of object link is determined by reading the target of the id attribute.

[*Example:* The following markup defines a reference to a linked object using Bonobo. The progId attribute contains the shared library that contains the widget. The r:id identifies the referenced Bonobo object.

```
<oleLink r:id="rb1" progId="OAFIID:Bonobo_Sample_Calculator">
...
</oleLink>
```

The target of the relationship with ID rb1, defines the Bonobo object itself. This example shows a link to a sample Bonobo widget taken from the following article, which also provides an introduction to Bonobo – <http://www.ibm.com/developerworks/webservices/library/co-bnbo2.html>. *end example*]

[*Example:* The following markup defines a reference to a linked object using KParts. The progId attribute contains the shared library that contains the plugin. The r:id identifies the referenced KParts object.

```
<oleLink r:id="rKp1" progId="libhtmlvalidatorplugin">
...
</oleLink>
```

The following XML, contained in the target of the relationship with ID rKp1, defines the KPart object, and will follow the kpartgui DTD:

```
<!DOCTYPE kpartgui SYSTEM "kpartgui.dtd">
<kpartgui library="libhtmlvalidatorplugin" name="htmlvalidatorplugin"
version="1" >
  <MenuBar>
    <Menu name="tools"><Text>&Tools</Text>
      <Action name="validatewebpage"/>
    </Menu>
  </MenuBar>
</kpartgui>
```

This example is taken from the kde.org web site, and contains a tutorial on building the plugin referenced by the above markup – <http://developer.kde.org/documentation/tutorials/dot/writing-plugins.html>. *end example*]

| Parent Elements |
|-------------------------|
| externalLink (§18.14.8) |

| Child Elements | Subclause |
|------------------------------|-----------|
| oleItems (Object Link Items) | §18.14.10 |

| Attributes | Description |
|--|---|
| id (Object Link Relationship) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Relationship ID that references a link in the relationships collection. The target attribute in the associated relationship will specify the external file name used for this oleLink. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| progId (Object Link Identifier) | The ID for the object link connection. [Example: For a KParts link, this would store the name of the appropriate KParts library. For an OLE link, this would store the ProgID of the appropriate OLE object. <i>end example</i>] The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[Note: The W3C XML Schema definition of this element's content model ([CT_OleLink](#)) is located in §A.2. *end note*]

18.14.12 row (Row)

This element contains data for an external worksheet row.

| Parent Elements |
|-----------------------|
| sheetData (§18.14.13) |

| Child Elements | Subclause |
|---------------------------|-----------|
| cell (External Cell Data) | §18.14.1 |

| Attributes | Description |
|------------|---|
| r (Row) | Row number of the row in the external book containing the cell data referenced. This attribute is required. |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalRow](#)) is located in §A.2. *end note*]

18.14.13 sheetData (External Sheet Data Set)

This element contains the cached worksheet data associated with a supporting workbook.

[*Note:* For an example, please refer to example at the beginning of this section. *end note*]

| Parent Elements |
|--------------------------|
| sheetDataSet (§18.14.14) |

| Child Elements | Subclause |
|----------------|-----------|
| row (Row) | §18.14.12 |

| Attributes | Description |
|---|--|
| refreshError (Last Refresh Resulted in Error) | Specifies that the last external data refresh for this sheet did not succeed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sheetId (Sheet Id) | Index of sheet in the external workbook that is referenced and partially cached in this data set. This is a 1-based index. This attribute is required. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetData](#)) is located in §A.2. *end note*]

18.14.14 sheetDataSet (Cached Worksheet Data)

This element serves as the collection for 1 or more sheetData elements.

| Parent Elements |
|-------------------------|
| externalBook (§18.14.7) |

| Child Elements | Subclause |
|-------------------------------------|-----------|
| sheetData (External Sheet Data Set) | §18.14.13 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetDataSet](#)) is located in §A.2. *end note*]

18.14.15 sheetName (Sheet Name)

Name of a worksheet in the supporting workbook

| Parent Elements |
|------------------------|
| sheetNames (§18.14.16) |

| Attributes | Description |
|------------------------|--|
| val (Sheet Name Value) | Name of the sheet. This attribute is required. The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetName](#)) is located in §A.2. *end note*]

18.14.16 sheetNames (Supporting Workbook Sheet Names)

This element is the container for all of the worksheet names in a supporting workbook.

| Parent Elements |
|-------------------------|
| externalBook (§18.14.7) |

| Child Elements | Subclause |
|------------------------|-----------|
| sheetName (Sheet Name) | §18.14.15 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExternalSheetNames](#)) is located in §A.2. *end note*]

18.14.17 val (DDE Link Value)

This element specifies a value associated with a particular DDE item.

[*Example:* Here's an example of how values, value, and val elements are written out in the spreadsheetML for a ddeItem supplied by a DDE server. In this example different cells in the workbook are bound to these specific DDE items:

```
<ddeLink xmlns:r="..." ddeService="StockSrv" ddeTopic="Prices">
  <ddeItems>
    <ddeItem name="Bread" advise="1">
      <values>
        <value>
          <val>3.5</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="Milk" advise="1">
      <values>
        <value>
          <val>5.7400000000000002</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="MSFT" advise="1">
      <values>
        <value>
          <val>54.130000000000003</val>
        </value>
      </values>
    </ddeItem>
    <ddeItem name="StdDocumentName" ole="1" advise="1"/>
  </ddeItems>
</ddeLink>
```

end example]

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

| Parent Elements |
|-------------------|
| value (§18.14.18) |

[*Note:* The W3C XML Schema definition of this element’s content model ([ST_Xstring](#)) is located in §A.6.9. *end note]*

18.14.18 value (Value)

This element contains a value associated with a particular DDE item. This serves as a container for the val element.

| Parent Elements |
|--------------------|
| values (§18.14.19) |

| Child Elements | Subclause |
|----------------------|-----------|
| val (DDE Link Value) | §18.14.17 |

| Attributes | Description |
|--------------------|---|
| t (DDE Value Type) | Indicates the DDE value type. The possible values for this attribute are defined by the ST_DdeValueType simple type (§18.18.23). |

[Note: The W3C XML Schema definition of this element's content model ([CT_DdeValue](#)) is located in §A.2. *end note*]

18.14.19 values (DDE Name Values)

This element defines a collection of values associated with DDE item.

| Parent Elements |
|--------------------|
| ddeItem (§18.14.2) |

| Child Elements | Subclause |
|----------------|-----------|
| value (Value) | §18.14.18 |

| Attributes | Description |
|----------------|---|
| cols (Columns) | The number of columns of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| rows (Rows) | The number of rows of data that is returned by the DDE server for this DDE item. The default value of this attribute is 1. |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DdeValues](#)) is located in §A.2. *end note*]

18.15 Volatile Dependencies

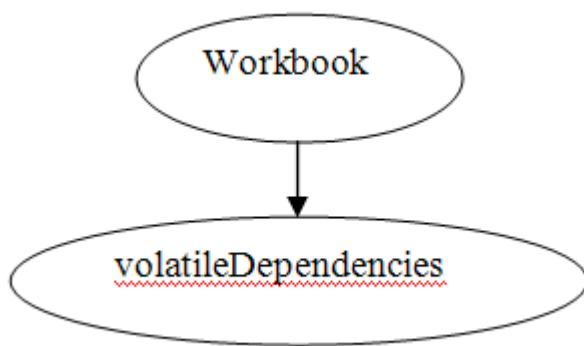

The volatileDependencies part provides a cache of data that supports Real Time Data (RTD) and CUBE functions in the workbook. Both of these types of functions require connectivity to external servers to retrieve their data. For RTD functions, an RTD interface defines how data is provided on the server, and how it is retrieved on the client. Similarly, CUBE functions access data in OLAP cubes via their own function syntax. The volatileDependencies part provides that cache of data and supporting information about these functions and their data servers and connections. This allows the spreadsheet application to work with cached values when recalculating the workbook when the external server is not available.

[*Note:* How users of SpreadsheetML access RTD data depends on the integration the user's spreadsheet application provides for RTD. *end note*]

[*Note:* Data connectivity can use a number of different technologies. One example of potential values stored in this attribute can be found at: http://msdn.microsoft.com/library/default.asp?url=/library/en-us/vbaxl11/html/xlobjIRtdServer_HV03085058.asp *end note*]

File Architecture

The workbook holds the relationship to the volatile dependencies part.

Illustration

[*Example:* The following image shows an example implementation of CUBE and Real Time Data (RTD) functions in a worksheet.

| | A |
|----|--|
| 1 | =RTD("jrtdx.rtd",,"aaa") |
| 2 | |
| 3 | =CUBEMEMBER("xlextdat9 Adventure Works DW Adventure Works","[Department].[Departments].[Corporate]") |
| 4 | =CUBEVALUE("xlextdat9 Adventure Works DW Adventure Works",A3) |
| 5 | =CUBESET("xlextdat9 Adventure Works DW Adventure Works","[Customer].[Customer Geography].[All Customers].[United Kingdom].children","Set") |
| 6 | =CUBERANKEDMEMBER("xlextdat9 Adventure Works DW Adventure Works",\$A\$3,ROW(A1)) |
| 7 | =CUBESETCOUNT(A3) |
| 8 | =CUBEMEMBERPROPERTY("xlextdat9 Adventure Works DW Adventure Works","[Product].[Product].[All Products].[Blade]","Class") |
| 9 | =CUBEKPIMEMBER("xlextdat9 Adventure Works DW Adventure Works","Growth in Customer Base",2) |
| 10 | |

The following example shows the XML that describes the functions in the illustration.

```
<volTypes xmlns="...">
  <volType type="realTimeData">
    <main first="jrtdx.rtd">
      <tp t="s">
        <v>aaa: 4447</v>
        <stp/>
        <stp>aaa</stp>
        <tr r="A1" s="1"/>
      </tp>
    </main>
  </volType>
  <volType type="olapFunctions">
    <main first="xlextdat9 Adventure Works DW Adventure Works">
      <tp t="e">
        <v>#N/A</v>
        <stp>1</stp>
        <tr r="A6" s="1"/>
        <tr r="A9" s="1"/>
        <tr r="A8" s="1"/>
        <tr r="A5" s="1"/>
        <tr r="A4" s="1"/>
        <tr r="A3" s="1"/>
      </tp>
    </main>
  </volType>
</volTypes>
```

end example]

While RTD and Cube functions share the cache, there are differences in how the data is interpreted. [Example: RTD dependencies, volTypes/volType/main@first specifies the ProgId of the RTD server. Whereas for OLAP dependencies, main@first indicates the connection name. *end example]*

18.15.1 main (Main)

Represents dependency information for all topics within a volatile dependency type that share the same first string or function argument.

| Parent Elements |
|--------------------|
| volType (§18.15.5) |

| Child Elements | Subclause |
|----------------|-----------|
| tp (Topic) | §18.15.3 |

| Attributes | Description |
|----------------------|---|
| first (First String) | <p>Specifies the first string of all topics within this main. This string corresponds to the first argument to the RTD or CUBE function.</p> <p>For RTD functions, this argument represents the progID of the IRTDServer.</p> <p>[Example: <code><main first="jrtdx.rtd"></code> <i>end example</i>]</p> <p>For CUBE functions, this argument represents the CUBE connection.</p> <p>[Example: <code><main first="xlextdat9 Adventure Works DW Adventure Works"></code> <i>end example</i>]</p> <p>For more information on RTD and CUBE functions in SpreadsheetML, see §18.17 in Formulas.</p> <p>The possible values for this attribute are defined by the ST_Xstring simple type (§22.9.2.19).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_VolMain](#)) is located in §A.2. *end note*]

18.15.2 stp (Strings in Subtopic)

Represents all strings in the topic except for the first. An stp is allocated for each additional argument. [Example: For the topic {"progid", "", "foo"}, there would be two STPs: "" and "foo". *end example*]

For Cube functions, value of "1" indicates that all of the related cells with calling cube functions have been refreshed.

The possible values for this element are defined by the ST_Xstring simple type (§22.9.2.19).

| Parent Elements |
|-----------------|
| tp (§18.15.3) |

[*Note:* The W3C XML Schema definition of this element’s content model ([ST_Xstring](#)) is located in §A.6.9. *end note*]

18.15.3 tp (Topic)

Represents dependency information for all topics within a volatile dependency type that share the same first string or argument.

For the RTD function, this collection will contain the remaining parameters of the function, and indicate the last known value and data type of that value.

| Parent Elements |
|-----------------|
| main (§18.15.1) |

| Child Elements | Subclause |
|---------------------------|------------|
| stp (Strings in Subtopic) | §18.15.2 |
| tr (References) | §18.15.4 |
| v (Cell Value) | §18.3.1.96 |

| Attributes | Description |
|------------|---|
| t (Type) | <p>Specifies the type of the cell value. This value corresponds to the type of data returned by the RTD or CUBE function.</p> <p>[<i>Example:</i> In the following RTD example, the value "aaa: 4447" has a string data type.</p> <pre><tp t="s"> <v>aaa: 4447</v> </tp></pre> <p><i>end example</i>]</p> <p>For Cube functions, this attribute can be ignored when stp value is "1".</p> <p>The possible values for this attribute are defined by the ST_VolValueType simple type (§18.18.91).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_VolTopic](#)) is located in §A.2. *end note*]

18.15.4 tr (References)

Represents the reference to a cell that depends on this topic. Each topic can have one or more cells dependencies.

For CUBE functions, each <tr> element contains a cell whose cube function call dependent on the connection in main@first.

| Parent Elements |
|-----------------|
| tp (§18.15.3) |

| Attributes | Description |
|---------------|---|
| r (Reference) | <p>Specifies a reference to the cell location. The location is scoped to the sheet specified in s.</p> <p>[Example: <code><tr r="A6" s="1"/></code> <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_CellRef simple type (§18.18.7).</p> |
| s (Sheet Id) | <p>Specifies the sheet index.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_VolTopicRef](#)) is located in §A.2. *end note*]

18.15.5 volType (Volatile Dependency Type)

Represents dependency information for a specific type of external data server. There is no limit on the number of external dependencies that can exist for a workbook in SpreadsheetML.

| Parent Elements |
|---------------------|
| volTypes (§18.15.6) |

| Child Elements | Subclause |
|----------------|-----------|
| main (Main) | §18.15.1 |

| Attributes | Description |
|-------------|--|
| type (Type) | <p>Specifies the type of the external dependency.</p> <p>[Example: <volType type="olapFunctions"> end example]</p> <p>The possible values for this attribute are defined by the ST_VolDepType simple type (§18.18.90).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_VolType](#)) is located in §A.2. end note]

18.15.6 volTypes (Volatile Dependency Types)

Represents the collection of external dependencies for a workbook. This element defines the structure of the volatileDependencies part. There can only be one volatileDependencies part for each workbook. However, the part can contain one or more dependency types.

The volatileDependencies part stores the following information for Real Time Data (RTD) and CUBE functions:

- Cached values
- Parameters used
- Connection and Server names

[Example: Outline of XML Structure

```
<volTypes xmlns="...">
  <volType type="realTimeData">
  </volType>
  <volType type="olapFunctions">
  </volType>
</volTypes>
```

end example]

| Parent Elements |

| Root element of SpreadsheetML Volatile Dependencies part |

| Child Elements | Subclause |
|---|-----------|
| extLst (Future Feature Data Storage Area) | §18.2.10 |

| Child Elements | Subclause |
|------------------------------------|-----------|
| volType (Volatile Dependency Type) | §18.15.5 |

[Note: The W3C XML Schema definition of this element's content model (CT_VolTypes) is located in §A.2. *end note*]

18.16 Custom XML Mappings

Custom XML Mappings enable binding of arbitrary XML data structures and arbitrary XML schema definitions to the workbook. Once a DataBinding has been established, then various XML nodes can be mapped to table columns, ranges of cells, or even single cells (for non-repeating attributes and elements). Once an XML Mapping is fully defined, the application is able to import and export XML instance structures according to the schema definition. ECMA-376 does not require any particular XML schema language.

[Note: Some examples of XML schema languages that might be used to implement Custom XML Mappings include:

- W3C XML Schema - <http://www.w3.org/XML/Schema>
- RELAX NG – ISO/IEC 19757-2
- Schematron – ISO/IEC 19757-3
- NVDL – ISO/IEC 19757-4

end note]

While the original schema or XML definition can reside on disk or at some file location outside the workbook, a copy of the schema is stored in the workbook.

Every time an XML instance or schema is added to the workbook, a new map object is created which ties together the schemas and where the various elements are mapped in the workbook.

[Example:

```
<MapInfo SelectionNamespaces="">
  <Schema ID="Schema1">
    <xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema">
      <xsd:element nillable="true" name="Root">
        <xsd:complexType>
          <xsd:sequence minOccurs="0">
            <xsd:element minOccurs="0" nillable="true" name="EmployeeInfo"
              form="unqualified">
```

```

<xsd:complexType>
  <xsd:sequence minOccurs="0">
    <xsd:element minOccurs="0" nillable="true" type="xsd:string"
      name="Name" form="unqualified"></xsd:element>
    <xsd:element minOccurs="0" nillable="true" type="xsd:date"
      name="Date" form="unqualified"></xsd:element>
    <xsd:element minOccurs="0" nillable="true" type="xsd:integer"
      name="Code" form="unqualified"></xsd:element>
  </xsd:sequence>
</xsd:complexType></xsd:element>

<xsd:element minOccurs="0" maxOccurs="unbounded" nillable="true"
  name="ExpenseItem" form="unqualified">
  <xsd:complexType>
    <xsd:sequence minOccurs="0">
      <xsd:element minOccurs="0" nillable="true" type="xsd:date"
        name="Date" form="unqualified"></xsd:element>
      <xsd:element minOccurs="0" nillable="true" type="xsd:string"
        name="Description" form="unqualified"></xsd:element>
      <xsd:element minOccurs="0" nillable="true" type="xsd:double"
        name="Amount" form="unqualified"></xsd:element>
    </xsd:sequence>
  </xsd:complexType></xsd:element>
</xsd:sequence>
<xsd:attribute name="Currency" form="unqualified"
  type="xsd:string"></xsd:attribute>
<xsd:attribute name="Approved" form="unqualified"
  type="xsd:string"></xsd:attribute>
</xsd:complexType>
</xsd:element>
</xsd:schema>
</Schema>
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
  ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
  PreserveSortAFLayout="true" PreserveFormat="true">
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
</MapInfo>

```

end example]

For XML mapped into a SpreadsheetML Table there will also be additional information in the SpreadsheetML file which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in a `xmlColumnPr` element, under the `tableColumn` node.

[Example:

```
<table xmlns="..." id="1" name="Table1" displayName="Table1" ref="A1:H11"
  tableType="xml" totalsRowShown="0" connectionId="1">
  <tableColumns count="5">
    <tableColumn id="1" uniqueName="Name" name="Name">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Name"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="2" uniqueName="Date" name="Date">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Date"
        xmlDataType="date"/>
    </tableColumn>
    <tableColumn id="3" uniqueName="Code" name="Code">
      <xmlColumnPr mapId="1" xpath="/Root/EmployeeInfo/Code"
        xmlDataType="integer"/>
    </tableColumn>
    <tableColumn id="4" uniqueName="Description" name="Description">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Description"
        xmlDataType="string"/>
    </tableColumn>
    <tableColumn id="5" uniqueName="Amount" name="Amount">
      <xmlColumnPr mapId="1" xpath="/Root/ExpenseItem/Amount"
        xmlDataType="double"/>
    </tableColumn>
  </tableColumns>
  <tableStyleInfo name="TableStyleMedium9" showFirstColumn="0"
    showLastColumn="0" showRowStripes="1" showColumnStripes="0"/>
</table>
```

end example]

For XML mapped into a single SpreadsheetML cell there will also be additional information in the TableSingleCells part which refers back to the XML Map and XPath of the element or attribute mapped. This information is stored in the xmlPr element under the xmlCellPr node.

[Example:

```
<singleXmlCells xmlns="...">
  <singleXmlCell id="2" name="Table2" displayName="Table2" r="D19"
    connectionId="1">
    <xmlCellPr id="1" uniqueName="Currency">
      <xmlPr mapId="1" xpath="/Root/@Currency" xmlDataType="string"/>
    </xmlCellPr>
  </singleXmlCell>
```

```
<singleXmlCell id="3" name="Table3" displayName="Table3" r="D20"
  connectionId="1">
  <xmlCellPr id="1" uniqueName="Approved">
    <xmlPr mapId="1" xpath="/Root/@Approved" xmlDataType="string"/>
  </xmlCellPr>
</singleXmlCell>
<singleXmlCell id="4" name="Table4" displayName="Table4" r="D18"
  connectionId="1">
  <xmlCellPr id="1" uniqueName="Name">
    <xmlPr mapId="1" xpath="/Root/EmployeeInfo/Name" xmlDataType="string"/>
  </xmlCellPr>
</singleXmlCell>
</singleXmlCells>
```

end example]

18.16.1 DataBinding (XML Mapping)

This element contains properties which specify how the XML mapping should work.

[Example:

```
<DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
```

end example]

[Note: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note]*

| Parent Elements |
|-----------------|
| Map (§18.16.2) |

| Child Elements | Subclause |
|------------------------------|-----------|
| Any element in any namespace | n/a |

| Attributes | Description |
|---|---|
| ConnectionID (Reference to Connection ID) | Specifies the Connection ID to the external connection in the External Data Connections part. Required if FileBinding is true. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

| Attributes | Description |
|---|--|
| DataBindingLoadMode (XML Data Loading Behavior) | <p>Specifies the mode for loading XML data related to this DataBinding.</p> <p>Supported values are as follows:</p> <ul style="list-style-type: none"> 0 - None 1 - Normal 2 - Delay Load 3 - Asynchronous 4 - Object Model <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| DataBindingName (Unique Identifier) | <p>Specifies the data binding name. These shall be unique for each DataBinding.</p> <p>[Example: <code><DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/></code> end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| FileBinding (Binding to External File) | <p>Specifies whether the data should be retrieved directly from an XML file. The path to the file is in the corresponding connection element</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| FileBindingName (File Binding Name) | <p>Specifies the file binding name. These shall be unique for each DataBinding.</p> <p>[Example: <code><DataBinding DataBindingName="Binding1" FileBinding="true" FileBindingName="Binding1" DataBindingLoadMode="1"/></code> end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_DataBinding](#)) is located in §A.2. end note]

18.16.2 Map (XML Mapping Properties)

This element contains all of the properties related to the XML map, and the behaviors expected during data refresh operations.

[Example:

```
<Map ID="1" Name="Root_Map" RootElement="Root" SchemaID="Schema1"
  ShowImportExportValidationErrors="false" AutoFit="true" Append="false"
  PreserveSortAFLayout="true" PreserveFormat="true">
  <DataBinding ConnectionID="1" FileBinding="true" DataBindingLoadMode="1"/>
</Map>
```

end example]

| Parent Elements |
|--------------------|
| MapInfo (§18.16.3) |

| Child Elements | Subclause |
|---------------------------|-----------|
| DataBinding (XML Mapping) | §18.16.1 |

| Attributes | Description |
|---|---|
| Append (Append Data to Table) | Specifies whether XML data should overwrite or be appended to the end of the table or range of mapped cells when data is refreshed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| AutoFit (AutoFit Table on Refresh) | Specifies whether columns should be resized to fit the XML data after a data refresh operation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| ID (XML Mapping ID) | Specifies the ID of the XML map. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| Name (XML Mapping Name) | Specifies the name of the XML map. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| PreserveFormat (Preserve Cell Formatting) | Specifies whether cell number formatting in the sheet should be preserved during data refresh operations, or whether the number formatting defined by the XML data type should be used. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| PreserveSortAFLay out (Preserve AutoFilter State) | Specifies whether to keep the filter state of the Table or cell range intact during a data refresh. |

| Attributes | Description |
|--|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| RootElement (Root Element Name) | Specifies the names of the root XML element. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| SchemaID (Schema Name) | Specifies the unique name of the schema used for the mapping. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| ShowImportExport ValidationErrors (Show Validation Errors) | Specifies whether XML schema validation errors should be displayed during data refresh or data export. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Map](#)) is located in §A.2. *end note*]

18.16.3 MapInfo (XML Mapping)

This element acts as the container for all of the XML schemas and maps attached to the SpreadsheetML document.

| Parent Elements |
|--|
| Root element of SpreadsheetML Custom XML Mappings part |

| Child Elements | Subclause |
|------------------------------|-----------|
| Map (XML Mapping Properties) | §18.16.2 |
| Schema (XML Schema) | §18.16.4 |

| Attributes | Description |
|---|---|
| SelectionNamespaces (Prefix Mappings for XPath Expressions) | Specifies namespaces for use in XPath expressions when it is necessary to define new namespaces externally. Namespaces are defined in the XML style, as a space-separated list of namespace declaration attributes [Example: The following example contains elements that belong to "a" and "b", in addition to elements that do not belong to any namespace. <pre><?xml version="1.0"?> <root></pre> |

| Attributes | Description |
|------------|--|
| | <pre> <branch>branch</branch> <a:root xmlns:a="http://myserver.com"> <a:branch>a-branch</a:branch> <b:branch xmlns:b="http://yourserver.com"> b-branch</b:branch> </a:branch> </root> end example] </pre> <p>This is used when writing Xpath expressions at runtime against the XML instance structures, because the Xpath expressions use namespace prefixes instead of the fully spelled out namespace.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_MapInfo](#)) is located in §A.2. *end note*]

18.16.4 Schema (XML Schema)

This element contains the XML tree for an attached schema.

[Note: This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

| Parent Elements |
|--------------------|
| MapInfo (§18.16.3) |

| Child Elements | Subclause |
|------------------------------|-----------|
| Any element in any namespace | n/a |

| Attributes | Description |
|----------------|--|
| ID (Schema ID) | <p>Specifies the unique name or ID for this attached schema.</p> <p>[Example: ID = "Schema1" end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| Namespace | Specifies the namespace used by the schema. |

| Attributes | Description |
|-------------------------------------|---|
| (Schema Root Namespace) | <p>[Example:</p> <pre><MapInfo SelectionNamespaces="..."> <Schema ID="Schema1" Namespace="..."></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| SchemaLanguage (Schema Language) | <p>Specifies the media type of the schema language.</p> <p>[Example:</p> <pre><Schema ... SchemaLanguage="application/relax-ng-compact-syntax"/></pre> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p> |
| SchemaRef (Schema Reference) | <p>The schemaRef attribute is used in the specific case where the schema definition happens to include another schema file that contributes to the same namespace. The value of this attribute is the relative path to a "root" schema file on disk which in turn references the other schema files contributing type definitions to the same namespace.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Schema](#)) is located in §A.2. end note]

18.17 Formulas

18.17.1 Introduction

A SpreadsheetML *formula* is the syntactic representation of a series of calculations that is parsed or interpreted by the spreadsheet application into a function that calculates a value or array of values based upon zero-to-many inputs.

A formula is an expression that can contain the following: constants, operators, cell references, calls to functions, and names.

[Example: Consider the formula `PI()*(A2^2)`. In this case,

- `PI()` results in a call to the function `PI`, which returns the value of π .
- The cell reference `A2` returns the value in that cell.
- `2` is a numeric constant.
- The caret (^) operator raises its left operand to the power of its right operand.
- The parentheses, (and), are used for grouping.
- The asterisk (*) operator performs multiplication of its two operands.

end example]

18.17.2 Syntax

The syntax rules in this subclause follow the system shown in ISO/IEC 14977: literal text is surrounded by double-quotes (or by apostrophes); the left-square-bracket and right-square-bracket designate the start and end of an option; the left-curly-bracket and right-curly-bracket designate the start and end of an sequence of one-or-more items; the vertical-line indicates an alternative; and each rule ends with a semicolon. Whenever hyphen is used as the exception-symbol (as per ISO/IEC 14977), it is surrounded by white space, and further clarified by a comment.

The syntax rules below are modified by the context-sensitive rules stated in other subclauses of §18.17.*, as indicated by an EBNF comment of the form “(* see semantic rules at 18.17... *)”. [Note: Thus, in order to produce an automated verifier, the context-sensitive rules in subclauses 18.17.* must all be considered. The context-free syntax rules shown in this subclause provide an overview to assist comprehension by the reader, but do not represent the entirety of the context-sensitive rules. *end note*]

When used in narrative, production names are set in an italic style, as in *array-constant*, *expression*, and *function-name*.

The syntax of a formula is as follows:

```
formula=
    expression ;
expression=
    "(" , expression , ")" |
    constant |
    prefix-operator , expression |
    expression , infix-operator , expression |
    expression , postfix-operator |
    cell-reference |
    function-call |
    name ;
```

where *expression* is an arbitrarily complex expression involving constants (§18.17.2.1), operators (§18.17.2.2), cell references (§18.17.2.3), calls to functions (§18.17.2.4), and names (§18.17.2.5).

A *token* is the minimal lexical element of a formula. The categories of tokens are: constants (except for *array-constant*), operators, cell references, function names, names, and punctuators. The *punctuators* are:

- Left parenthesis (() and right parenthesis ()) used for expression grouping and in a function call.
- Comma (,) used in a function call and an *array-constant*.
- Left brace ({), right brace (}), and semicolon (;) used in an *array-constant*.

In a formula, an arbitrary number of space characters (U+0020) can precede the first token or follow the final token. An arbitrary number of space characters can separate two adjacent tokens, except that no space characters shall separate a *function-name* from the left parenthesis (() that follows it. Such space characters have no effect on the semantics of a formula; however, such spaces shall be distinguished from the space operator (§18.17.2.2).

All arithmetic terms in an *expression* are numbers that can be represented by the workbook's value space. For any given workbook, the default value space is IEC 60559's double precision. However, an implementation is permitted to override that default value space by use of the characteristics markup (§22.7). [Example: In the expression 1/3, although the operands appear to be integers, they are, in fact, floating-point numbers, and the result is 0.33..., not 0, as would result from integer division. end example]

As ranges of data are fundamental to spreadsheet calculations, many SpreadsheetML functions are able to take arrays as inputs and to return arrays as outputs. Based on whether the formula is an *array formula* or not, the way in which input ranges are interpreted and output values are understood to relate to cells sharing the formula can mean one of two things.

For an array formula: All range arguments are interpreted to be their full range. If the result of the formula is an array, the values of the array are meant to be returned across all of the cells in the sheet sharing the formula. (When the size of the range for an array formula exceeds in either dimension the size of the returned array, the excess cells take on a value of #N/A.)

For a normal (non-array) formula:

- Implicit intersection (§18.17.2.2) is performed on all arguments to functions except for those that allow a range.
- If the formula results in an array, only the first value from the array is returned to the cell.

Implicit intersection is determined as follows: When a range is passed to a function which expects only a single cell, a test is made to discover whether the calling cell intersects that range at any point horizontally or vertically. If it does, the cell at the point of intersection is passed to the function. [Example: The formula ABS(B1:B3) is entered into A2. Because the ABS function does not expect a range, implicit intersection is performed. A2 intersects B1:B3 horizontally on row 2, and so the value in B2 is passed into the function. end example]

The list of function arguments that allow a range is as follows:

- AND - all arguments

- AREAS – *reference* argument
- AVEDEV - all arguments
- AVERAGE - all arguments
- AVERAGEA - all arguments
- AVERAGEIF - all arguments except for *criteria*
- AVERAGEIFS - all arguments except for *criteria1*, *criteria2*, etc.
- CELL - *reference* argument
- CHITEST - all arguments
- COLUMN - all arguments
- COLUMNS - all arguments
- CORREL - all arguments
- COUNT - all arguments
- COUNTA - all arguments
- COUNTBLANK - all arguments
- COUNTIF - all arguments except *criteria*
- COUNTIFS - all arguments except for *criteria1*, *criteria2*, etc.
- COVAR - all arguments
- DAVERAGE - all arguments
- DCOUNT - all arguments
- DCOUNTA - all arguments
- DEVSQ - all arguments
- DGET - all arguments
- DMAX - all arguments
- DMIN - all arguments
- DPRODUCT - all arguments
- DSTDEV - all arguments
- DSTDEVP - all arguments
- DSUM - all arguments
- DVAR - all arguments
- DVARP - all arguments
- FORECAST - all arguments except for *x*
- FREQUENCY - all arguments
- FTEST - all arguments
- FVSCHEDULE - *schedule* argument
- GCD - all arguments
- GEOMEAN - all arguments
- GROWTH - all arguments
- HARMEAN - all arguments
- HLOOKUP - *table_array* argument
- IMPRODUCT - all arguments

- IMSUM - all arguments
- INDEX - *array* or *reference* argument
- INTERCEPT - all arguments
- LARGE - *array* argument
- LCM - all arguments
- LINEST - *known-xs* and *known-ys* arguments
- LOGEST - *known-xs* and *known-ys* arguments
- LOOKUP - all arguments except *lookup_value*
- MATCH - *lookup_array* argument
- MAX - all arguments
- MAXA - all arguments
- MDETERM – *array* argument
- MEDIAN - all arguments
- MIN - all arguments
- MINA - all arguments
- MINVERSE - all arguments
- MIRR - *values* argument
- MMULT - all arguments
- MODE - all arguments
- MULTINOMIAL - all arguments
- NETWORKDAYS - *holidays* argument
- NETWORKDAYS.INTL - *holidays* argument
- NPV - all arguments except *rate*
- OFFSET - *reference* argument
- OR - all arguments
- PEARSON - all arguments
- PERCENTILE - *array* argument
- PERCENTRANK - *array* argument
- PROB - *x_range* and *prob_range* arguments
- PRODUCT - all arguments
- QUARTILE – *array* argument
- RANK - *ref* argument
- ROW – *reference* argument
- ROWS – *array* argument
- RSQ - all arguments
- SKEW - all arguments
- SLOPE - all arguments
- SMALL - *array* argument
- STDEV - all arguments
- STDEVA - all arguments

- STDEVP - all arguments
- STDEVPA - all arguments
- STEYX - all arguments
- SUBTOTAL - all arguments except *function_num*
- SUM - all arguments
- SUMIF - all arguments except *criteria*
- SUMIFS - all arguments except *criteria1, criteria2, etc.*
- SUMPRODUCT - all arguments
- SUMSQ - all arguments
- SUMX2MY2 - all arguments
- SUMX2PY2 - all arguments
- SUMXMY2 - all arguments
- TRANSPOSE – all arguments
- TREND – all arguments except *const-flag*
- TRIMMEAN – *array* argument
- TRUNC – *x* argument
- TTEST – *array-1* and *array-2* arguments
- TYPE – all arguments
- VALUE – all arguments
- VAR – all arguments
- VARA – all arguments
- VARP – all arguments
- VARPA – all arguments
- VLOOKUP – *table-array* argument
- WORKDAY – *holidays* argument
- WORKDAY.INTL – *holidays* argument
- XIRR – all arguments except *guess*
- XNPV – all arguments except *rate*
- ZTEST – *array* argument

[Example: Here are some formulas taking array constants and ranges:

- $(B2:B4*C2:C4)+10.5$ performs three calculations: $(B2*C2)+10.5$, $(B3*C3)+10.5$, and $(B4*C4)+10.5$.
- $\text{SQRT}(\{1, 2, 3, 4\})$ returns 1 when entered normally.
- $\text{SQRT}(\{1, 2, 3, 4\})$ returns 1 when used in an array formula in a single cell, but if the array formula spans four or more contiguous cells in a row, it will return 1, 1.41, 1.73, and 2 in the first four cells, respectively, and #N/A in any additional cells in the horizontal range spanned by the array formula. (For display purposes, the values returned have been truncated to two decimal places.)

- `SUM(SQRT({1,2,3,4}))` returns 6.14 when entered normally; when used in an array formula, the intermediate calculation (in this instance performed by the `SQRT` function) is performed upon each element of the array.

With A1:A4 holding the values 1, 2, 3, and 4, respectively:

- `SQRT(A1:A4)` entered normally will do implicit intersection if it is in any of the rows 1–4, and return the `SQRT` of the number in the same row.
- `SQRT(A1:A4)` returns 1 when used in an array formula in a single cell, since it does not do implicit intersection in this case. If it is used in an array formula spanning multiple contiguous cells in a column, it will return 1, 1.41, 1.73, 2, #N/A, ..., respectively, in the cells in its vertical output range. *end example*

18.17.2.1 Constants

A *constant* represents a fixed value that can be used in the calculation of a formula. A constant has the following form:

```
constant=
  error-constant |
  logical-constant |
  numerical-constant |
  string-constant |
  array-constant ;
error-constant=
  "#DIV/0!" | "#N/A" | "#NAME?" | "#NULL!" |
  "#NUM!" | "#REF!" | "#VALUE!" | "#GETTING_DATA" ;
logical-constant=
  "FALSE" | "TRUE" ;
numerical-constant=
  whole-number-part, [full-stop], [exponent-part] |
  full-stop, fractional-part, [exponent-part] |
  whole-number-part, full-stop, fractional-part [exponent-part] ;
full-stop=
  "." ; (* also known as "period" *)
whole-number-part=
  digit-sequence ;
fractional-part=
  digit-sequence ;
exponent-part=
  "e" [ sign ] digit-sequence |
  "E" [ sign ] digit-sequence ;
sign=
  "+" |
  "-" ;
```

```

digit-sequence=
    decimal-digit, {decimal-digit} ;
decimal-digit=
    "0" | "1" | "2" | "3" | "4" |
    "5" | "6" | "7" | "8" | "9" ;
string-constant=
    double-quote, [string-chars], double-quote ;
double-quote=
    '"' ; (* one double-quote character*)
string-chars=
    string-char, {string-char} ;
string-char=
    '""' | (* consecutive double-quotes, with no space between them *)
    character - double-quote ; (* any character except double-quote *)
character=
    as defined by the production Char in the XML 1.0 specification, §2.2.

```

[*Example*: = $A\$1/3$ divides the value in A1 by the constant value three; = $A\$1\&"a$ appends the constant string "a" to the string representation of the contents of cell A1. *end example*]

To include a double-quote character (") in *string-chars*, precede it with another double-quote character.

[*Example*: "ab""cd" contains the characters ab"cd, and """"abcd"""" contains the characters "abcd". *end example*]

An *array constant* is a list of one or more constants organized in one or two dimensions, and delimited by braces. An array constant has the following form:

```

array-constant=
    "{", constant-list-rows, "}" ;
constant-list-rows=
    constant-list-row, { semicolon, constant-list-row } ;
semicolon=
    ";" ;
constant-list-row=
    constant, { comma, constant } ;

```

An *array-constant* shall not contain

- An *array-constant*.
- Columns or rows of unequal length.

Any *numerical-constant* in an *array-constant* can be preceded immediately by a *prefix-operator*.

The *constants* in an *array-constant* can have different types.

[Guidance An implementation is encouraged to not unnecessarily limit the number of rows and columns in an *array-constant*. end guidance]

[Example: {1,3.5,TRUE,"Hello"} is a 1x4 array of constants.

To represent the values 10, 20, 30, and 40, as a 1x4 array, use {10,20,30,40}.

To represent the values 10, 20, 30, and 40 in the first row, and 50, 60, 70, and 80 in the second row, use the following 2x4 array constant: {10,20,30,40;50,60,70,80}. end example]

error-constant is described in §18.17.3.

Each *constant* has a corresponding type (§18.17.2.6), as follows:

| Constant Form | Type |
|---------------------------|---------|
| <i>array-constant</i> | array |
| <i>error-constant</i> | error |
| <i>logical-constant</i> | logical |
| <i>numerical-constant</i> | number |
| <i>string-constant</i> | text |

In the context of cell formulas and values in SpreadsheetML, the following definition of precision shall apply:

By default, default representation of precision shall be as defined by the XML schema double type: <http://www.w3.org/TR/xmlschema-2/#double>. The default is therefore 53-bits of mantissa precision.

An application that uses XML schema double can optionally state the precision in the Additional Characteristics part by writing out the number of bits in the mantissa and exponent.

A compliant consumer shall parse numbers of arbitrary precision without error.

18.17.2.2 Operators

An *operator* is a symbol that specifies the type of operation to perform on one or more operands. There are arithmetic, comparison, text, and reference operators.

```

operator=
  ":" | comma | space | "^" | "*" | "/" | "+" | "-"
  | "&" | "=" | "<>" | "<" | "<=" | ">" | ">=" | "%" ;
infix-operator=
  ":" | comma | space | "^" | "*" | "/" | "+" | "-" | "&"
  | "=" | "<>" | "<" | "<=" | ">" | ">=" ;
postfix-operator=
  "%" ;
prefix-operator=
  "-" ;
  
```

The *operators* permitted in *expression* are:

| Operators | | | |
|----------------------|----------|--|------------|
| Family | Operator | Description | Precedence |
| Reference operators | : | Binary range operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to the cells inclusive of, and between, those references. [<i>Example</i> : SUM(B5:C15), which references 11 cells. <i>end example</i>] | highest |
| | , | Binary union operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to all those, possibly non-contiguous, cells. [<i>Example</i> : SUM((B5:B15,D5:D15)), which references 22 cells, 11 from column B, and 11 from column D. The grouping parentheses are necessary to indicate that the comma is an operator rather than a punctuator separating two arguments. <i>end example</i>] | |
| | space | Binary intersection operator, which takes two cell reference (§18.17.2.3) operands, and results in one reference to those, possibly non-contiguous, cells that are common. If the intersection is empty, the result is #NULL!. [<i>Example</i> : ((B1:C1) (C1:D1)) results in a reference to C1, while ((B1:D1) (B1,D1)) results in a single reference to B1 and D1. <i>end example</i>] | |
| Arithmetic operators | - | Unary minus | |
| | % | Percentage (unary postfix), which divides its operand by 100. [<i>Example</i> : 10.5%, which results in 0.105. <i>end example</i>] | |
| | ^ | Exponentiation | |
| | * | Multiplication | |
| | / | Division | |
| | + | Addition | |
| | - | Subtraction | |
| Text operator | & | Text concatenation (Each of the two operands is converted to text, if necessary, before concatenation.) | |
| Comparison | = | Equal-to | lowest |

| Operators | | | |
|-----------|----|--------------------------|--|
| operators | <> | Not-equal-to | |
| | < | Less-than | |
| | <= | Less-than or equal-to | |
| | > | Greater-than | |
| | >= | Greater-than-or-equal-to | |

expression can contain grouping parentheses to document the default precedence or to override it.

operators in *expression* having the same precedence associate left-to-right.

[*Example*: Given that cell E38 contains the value 4, and cell F38 contains the value 2, the formula

$$((-1+E38^2)*3-F38)/2$$

produces the result 21.5. *end example*]

The comparison operators yield TRUE for true and FALSE for false. An expression with value 0 tests logically false while one with any non-zero numeric value tests true.

For any given operator in an expression, if only one operand is an error value, the result is that error value. If more than one operand has an error value and those error values are the same, the result is that error value. If more than one operand has an error value and those error values are not all the same, as to which of those error values is used as the result is unspecified.

If the semantics of an operator having a given operand are not specified by ECMA-376, the result is #VALUE!.

[*Example*: "abc"+1 results in #VALUE!, and "abc"/0 results in #VALUE! rather than #DIV/0!. *end example*]

18.17.2.3 Cell References

Each set of horizontal cells in a worksheet is a *row*, and each set of vertical cells is a *column*. A cell's row and column combination designates the location of that cell. [*Guidance* An implementation is encouraged to not unnecessarily limit the number of rows and columns in a worksheet. *end guidance*]

A *cell reference* designates one or more cells on the same worksheet. Using references, one can:

- Use data contained in different parts of the same worksheet in a single formula.
- Use the value from a single cell in several formulas.
- Refer to cells on other sheets in the same workbook, and even to other workbooks. (References to cells in other workbooks are called *links*.)

A cell reference has the following form:

```

cell-reference=
    name |
    [work-sheet-prefix] A1-reference |
    [work-sheet-prefix] A1-reference, ":", A1-reference |
    [work-sheet-prefix] R1C1-reference |
    [work-sheet-prefix] R1C1-reference, ":", R1C1-reference ;

work-sheet-prefix=
    work-sheet-prefix-special |
    sheet-name, "!" |
    sheet-name, ":", sheet-name, "!" |
    "[", workbook-name, "]", sheet-name, ":", sheet-name, "!" ;

work-sheet-prefix-special=
    apostrophe, sheet-name-special, apostrophe, "!" |
    apostrophe, sheet-name-special, ":",
        sheet-name-special, apostrophe, "!" |
    apostrophe, "[", workbook-name-special, "]",
        sheet-name-special, apostrophe, "!" |
    apostrophe, "[", workbook-name-special, "]",
        sheet-name-special, ":", sheet-name-special,
        apostrophe, "!" ;

workbook-name=
    book-name-characters ;

book-name-characters=
    book-name-character, {book-name-character} ;

book-name-character=
    character - (operator | apostrophe | "[" | "]" | "?") ;
    (* any character except operator or ', [, ], or ? *)

apostrophe=
    "'" ; (* one apostrophe character *)

sheet-name=
    sheet-name-characters ;

sheet-name-character=
    character - (operator | apostrophe | "[" | "]" | "\" | "?") ;
    (* any character except operator or ', [, ], \, or ? *)

sheet-name-characters=
    sheet-name-character, {sheet-name-character} ;

workbook-name-special=
    book-name-start-character-special,
    [ book-name-characters-special ];

book-name-start-character-special=
    character - (apostrophe | "*" | "[" | "]" | ":" | "?") ;
    (* any character, including operator, except ', *, [, ], :, or ? *)

```

```

book-name-characters-special=
  book-name-character-special, {book-name-character-special} ;
book-name-character-special=
  apostrophe, apostrophe |
  character - (apostrophe | "*" | "[" | "]" | ":" | "?") ;
  (* any character, including operator, except ', *, [, ], :, or ? *)
sheet-name-special=
  sheet-name-start-character-special,
  [ [sheet-name-characters-special], sheet-name-end-character-special] ;
sheet-name-start-character-special=
  character - (apostrophe | "*" | "[" | "]" | "\" | ":" | "/"
  | "?") ;
  (* any character, including operator, except ', *, [, ], \, :, /, or ? *)
sheet-name-end-character-special=
  sheet-name-start-character-special ;
sheet-name-characters-special=
  sheet-name-character-special, {sheet-name-character-special} ;
sheet-name-character-special=
  apostrophe, apostrophe |
  character - (apostrophe | "*" | "[" | "]" | "\" | ":" | "/"
  | "?") ;
  (* any character, including operator, except ' *, [, ], \, :, /, or ? *)

```

A *relative cell reference* is based on the relative position of the cell that contains the formula and the cell to which the reference refers. If the position of the cell that contains the formula changes, the reference is changed along with it.

An *absolute cell reference* always refers to the absolute location of a cell. If the position of the cell that contains the formula changes, the absolute reference remains the same.

A *mixed cell reference* has either an absolute column and relative row, or an absolute row and relative column.

A *link or external reference* to a workbook is a reference that specifies the location of the workbook, including file or network path, book name, sheet name, and cell reference. Instead of writing the full file path or network location and workbook name directly in the f (formula) element, in order to make all external references more accessible, the workbook name shall be written in a Relationship part according to the Relationships semantic:

- Type shall be set to `http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath`,
- Target shall specify the full file path and file name, and
- TargetMode shall be set to External.

Additionally, in order to support the possibility that the external workbook is offline or otherwise inaccessible, a cache of the relevant sheet values in the referenced external workbook shall be stored within the referencing workbook according to §18.14.

This Supplementary Workbook Data part shall be the source part of the relationship that points to the external workbook as a target resource, and the Id of this relationship shall be referenced within the markup of the Supplementary Workbook Data part, using the externalBook element (§18.14.7).

The Supplementary Workbook Data part shall also be the target of a relationship whose source is the Workbook part (§18.2). The markup within the Workbook part shall reference this relationship Id using the externalReference element (§18.2.8).

Finally, a 1-based index referencing an externalReference within the collection externalReferences shall be written inline within the formula expression containing the reference to the external workbook. The index in this context shall be enclosed within square brackets, i.e.; left square bracket ([), followed by the index, followed by a right square bracket (]).

In this way, external resource files can more easily be accessed and updated.

[Example:

Consider the formula =SUM('C:\[Source.xlsx]Sheet1'!\$A\$1:\$A\$3)

This formula is expressed in the f element (formula) like this:

```
<f>SUM([1]Sheet1!$A$1:$A$3)</f>
```

The external reference to another workbook in this case is tokenized to [1]. The value inside the brackets is a 1-based index to the externalReferences collection in the workbook part, referencing a specific externalReference element.

The corresponding content of externalReferences in the workbook part is:

```
<externalReferences>
  <externalReference r:id="rId4"/>
</externalReferences>
```

The workbook part's externalReferences collection indicates that there is an external workbook reference in this workbook. The Supplementary Workbook Data cache, also stored in this workbook, can be found by following the relationship from the workbook whose id value is rId4.

That particular relationship (rId4) is expressed as:

```
<Relationship Id="rId4" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="externalLinks/externalLink1.xml"/>
```

The above relationship indicates that the formula is supported by the Supplementary Workbook Data cache located at externalLinks/externalLink1.xml in the package.

The corresponding content in externalLink1.xml follows the markup specified in §18.14, Supplementary Workbook Data. The externalBook element in that markup indicates the id of the relationship that points from the source part externalLink1.xml to the location of the actual external workbook:

```
<externalBook xmlns:r="http://purl.oclc.org/ooxml/officeDocument/relationships"
r:id="rId1">
```

That relationship (rId1) is shown here:

```
<Relationship Id="rId1" Type=
"http://purl.oclc.org/ooxml/officeDocument/relationships/externalLinkPath"
Target="file:///C:/Source.xlsx" TargetMode="External"/>
```

This relationship indicates that the external workbook that the formula references resides on a local drive, at c:\source.xlsx. *end example*

It is possible to process the same cell or set of cells on multiple worksheets within a workbook, using a *3-D reference*. A reference of this type is made up of the cell reference, preceded by a range of worksheet names, and an exclamation mark character (!), in that order. A 3-D reference can be used to refer to cells on other sheets, to defined names, and to create formulas by using the following functions: AVERAGE, AVERAGEA, COUNT, COUNTA, MAX, MAXA, MIN, MINA, PRODUCT, STDEV, STDEVA, STDEVP, STDEVPA, SUM, VAR, VARA, VARP, and VARPA.

3-D references shall not be used in array formulas.

By default, a cell reference is understood to refer to one or more cells in the current worksheet. However, a cell reference can be preceded by its parent worksheet name and an exclamation mark (!), in that order. This allows cells in one worksheet to be referenced in another worksheet of the same workbook. [*Example*: The cell reference MonthlyTotals!D1:D12 might be used from within a sibling (or the same) worksheet of MonthlyTotals to refer to those 12 cells. *end example*]

An *area* is a set of rectangular-shaped contiguous cells. An area can be a single cell. [*Example*: A5 and B6:C10 each designate one area, and D3:D5, E12:F15 designates two areas (the comma (,) being the union operator). *end example*] [*Note*: The number of areas designated by a cell reference can be obtained by calling the function AREAS (§18.17.7.10). *end note*]

There are two cell reference styles: A1 (§18.17.2.3.1) and R1C1 (§18.17.2.3.2).

18.17.2.3.1 A1-Style Cell References

A cell reference using the A1 reference style has the following form:

```
A1-reference=
A1-column, ":", A1-column    |
A1-row, ":", A1-row         |
A1-column, A1-row          ;
```

```

A1-column=
  A1-relative-column |
  A1-absolute-column ;
A1-relative-column=
  letter, {letter} ; (* see semantic rules at 3.17.2.3.1 *)
letter=
  "a"|"b"|"c"|"d"|"e"|"f"|"g"|"h"|"i"|"j"|"k"|"l"|"m" |
  "n"|"o"|"p"|"q"|"r"|"s"|"t"|"u"|"v"|"w"|"x"|"y"|"z" |
  "A"|"B"|"C"|"D"|"E"|"F"|"G"|"H"|"I"|"J"|"K"|"L"|"M" |
  "N"|"O"|"P"|"Q"|"R"|"S"|"T"|"U"|"V"|"W"|"X"|"Y"|"Z" ;
A1-absolute-column=
  "$", A1-relative-column ;
A1-row=
  A1-relative-row |
  A1-absolute-row ;
A1-relative-row=
  digit-sequence ; (* shall be non-zero; see 3.17.2.3.1 *)
A1-absolute-row=
  "$", A1-relative-row ;

```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has an alphabetic heading named sequentially from left-to-right, A–Z, then AA–AZ, BA–BZ, ..., ZA–ZZ, AAA–AAZ, ABA–ABZ, and so on. Column letters are not case-sensitive.

A relative reference to a single cell is written as its column letter immediately followed by its row number. A relative reference to a whole row is written as its row number. A relative reference to a whole column is written as its column letter. A reference to a range of two or more cells is written as two single-cell references separated by the binary range operator (:). An absolute A1 reference is made up of a cell's column letter followed by its row number, with each being preceded by a dollar character (\$). [Example: A2, B34, and B5:D8 are relative A1 references. \$A\$2, \$B\$34, and \$B\$5:\$D\$8 are absolute A1 references. \$A2, B\$34, and \$B5:D\$8 are mixed A1 references. *end example*]

[Example: SUM(Sheet2:Sheet13!B5) adds all the values contained in cell B5 on all the worksheets between and including Sheet2 and Sheet13. *end example*]

For rules on how deal with potential ambiguities between cell references and defined names, see §18.17.5.1.

18.17.2.3.2 R1C1-Style Cell Reference

A cell reference using the R1C1 reference style has the following form:

```

R1C1-reference=
  R1C1-row-only      |
  R1C1-column-only   |
  R1C1-row, R1C1-column ;

```

```

R1C1-row-only=
  "R", R1C1-absolute-number, |
  "R[" , R1C1-relative-number, "]" ;
R1C1-row=
  R1C1-relative-row |
  R1C1-absolute-row ;
R1C1-relative-row=
  "R[" , R1C1-relative-number, "]" ;
R1C1-absolute-row=
  "R" |
  "R", R1C1-absolute-number ;
R1C1-column-only=
  "C", R1C1-absolute-number |
  "C[" , R1C1-relative-number, "]" ;
R1C1-column=
  R1C1-relative-column |
  R1C1-absolute-column ;
R1C1-relative-column=
  "C[" , R1C1-relative-number, "]" ;
R1C1-absolute-column=
  "C" |
  "C", R1C1-absolute-number ;
R1C1-relative-number=
  ["-"], digit-sequence ;
R1C1-absolute-number=
  digit-sequence ; (* shall be non-zero; see 3.17.2.3.2 *)

```

In this style, each row has a numeric heading numbered sequentially from the top down, starting at 1. Each column has a numeric heading numbered sequentially from left-to-right, starting at 1.

A whole row is referenced by omitting the column, and a whole column is referenced by omitting the row. An absolute row or column reference uses absolute row or column numbers, respectively. A relative row or column reference uses, respectively, row or column offsets from the cell containing the formula, with a negative offset indicating a row to the left or a column above, and a positive offset indicating a row to the right or a column below. Specifying an offset of zero is equivalent to omitting that offset and its delimiting brackets. *[Example: R[-2]C refers to the cell two rows up and in the same column, R[2]C[2] refers to the cell two rows down and two columns to the right, R2C2 refers to the cell in the second row and in the second column, R[-1] refers to the entire row above the active cell, and R refers to the current row. end example]*

The R1C1 alternate reference style can only be used at runtime. See §18.17.6.1 for XML-related details.

18.17.2.4 Functions

A *function* is a named formula that takes zero or more arguments, performs an operation, and, optionally, returns a result. A function call has the following form:

```

function-call=
    function-name, "(", [argument-list], ")"    ;
function-name=
    prefixed-function-name      |
    predefined-function-name    |
    user-defined-function-name  ;
predefined-function-name=
    "ABS" | "ACOS" | "ACOSH"
    | ( any of the other functions defined in §18.17.7) ;
prefixed-function-name=
    "ISO.", predefined-function-name |
    "ECMA.", predefined-function-name
user-defined-function-name=
    letter, [ user-defined-name-characters ]    ;
user-defined-name-characters=
    user-defined-name-character, {user-defined-name-character} ;
user-defined-name-character=
    letter | decimal-digit | full-stop    ;
argument-list=
    argument, { comma, argument }    ;
comma=
    ","    ;
argument=
    expression    ;

```

predefined-function-names and *user-defined-function-names* are not case-sensitive.

A *user-defined-function-name* shall not have any of the following forms:

- TRUE or FALSE
- *name*
- *cell-reference*

[*Guidance*: An implementation is encouraged to support *user-defined-function-names* at least as long as 255 characters. *end guidance*]

The semantics of a call to a function having a *user-defined-function-name* are unspecified.

[*Example*: Here are some function calls: PI(), POWER(A1,B3), and SUM(C6:C10). *end example*]

An argument to a function can be a call to a function. That is, function calls can nest. [*Guidance* An implementation is encouraged to support at least 64 levels of nested function calls. *end guidance*]

Some functions take a variable number of arguments. This is indicated in the Syntax sections of §18.17.7 by their having *argument-list* as all, or the trailing part, of their argument list. The total number of arguments that shall be passed to such functions is at least 1.

[*Guidance* An implementation is encouraged to support function calls having at least 255 arguments. *end guidance*]

Expressions can have one or more values. Scalar expressions designate a single value, and cell references and array constants can designate multiple values. In the case of a multi-value expression, the way in which this is handled by a function when passed as an argument depends on a number of factors.

Most functions and operators expect either single- or multi-valued arguments and perform all of the array calculations whenever multi-valued arguments are present. [*Example*: `SQRT({1;2;3;4})`; see the examples in §18.17.2. *end example*]

When a function expects a single-valued argument but a multi-valued expression is passed, an attempt can be made to convert that set of values to a single value. For an array value or constant, the value of the expression is the value of the first element within that array value or constant. For a cell range, the first element can be used, or implicit intersection can be performed—the exact behavior is unspecified.

When a function expects a multi-valued argument but a single-valued expression is passed, that single-valued argument is treated as a 1x1 array.

For rules on how deal with potential ambiguities between function names and defined names, see §18.17.5.1.

18.17.2.5 Names

A *name* is an alias for a constant, a cell reference, or a formula. [*Note*: A name in a formula can make it easier to understand the purpose of that formula. For example, the formula `SUM(FirstQuarterSales)` is easier to identify than `SUM(C20:C30)`. *end note*]

Here is the syntax for *name*:

```
name=
  [ workbook-name, "!" ], name-start-character, [ name-characters ] ;
name-start-character=
  letter | underscore | backslash ;
underscore=
  "_" ;
backslash=
  "\" ;
name-characters=
  name-character, {name-character} ;
name-character=
  letter | decimal-digit | underscore | full-stop ;
```

names are not case-sensitive.

All *names* within a workbook shall be unique. If the same *names* are defined in two workbooks, both *names* can be used in the same context by prefixing them with their corresponding workbook name and an exclamation mark (!). [Example: SUM(Sales.xlsx!ProjectedSales) refers to the named range ProjectedSales in the workbook named Sales.xlsx. end example]

A *name* shall not have any of the following forms:

- TRUE or FALSE
- *user-defined-function-name*
- *cell-reference*

[Guidance An implementation is encouraged to support *names* at least as long as 255 characters. end guidance]

For rules on how deal with potential ambiguities between function names and defined names, or between cell references and defined names, see §18.17.5.1.

18.17.2.6 Types and Values

Each *expression* has a type. SpreadsheetML formulas support the following types: array, error, logical, number, and text.

An array value or constant represents a collection of one or more elements, whose values can have any type (i.e., the elements of an array need not all have the same type).

An error value (§18.17.3) or constant represents an error, and can have any value defined for *error-constant* (§18.17.2.1).

A logical value or constant represents a truth value, and can have any value defined for *logical-constant* (§18.17.2.1).

A numeric value or constant represents a real number, and can have any value defined for *numeric-constant* (§18.17.2.1). The term "number" is used as a generic name for any expression of type *number*.

A text value or constant represents arbitrary text, and can have any value defined for *string-constant* (§18.17.2.1). The term "string" is used as a generic name for any expression of type *text*.

An implementation is permitted to provide an implicit conversion from *string-constant* to number. However, the rules by which such conversions take place are implementation-defined. [Example: An implementation might choose to accept "123"+10 by converting the string "123" to the number 123. Such conversions might be locale-specific in that a *string-constant* such as "10,56" might be converted to 10.56 in some locales, but not in others, depending on the radix point character. end example]

[Guidance An implementation is encouraged to support strings at least as long as 32,767 characters. end guidance]

A complex number is represented as a string in one of two equivalent text formats: $x + yi$ or $x + yj$, where x is the real part, and y is the imaginary part. [Example: "3+4i" and "-2.5-34.6j" end example]

18.17.2.7 Single- and Array Formulas

A formula can either be a single-cell formula, or an array formula.

A single-cell formula is applied to a single cell while an array formula is applied to a range of cells as a group.

When a single-cell formula results in a single value, the designated cell takes on that value. [Example: When cell A10 contains $\text{SIN}(0.3)$, the result stored in that cell is 0.295520207. end example]

When a single-cell formula results in multiple values, the designated cell takes on the first of those values. [Example: When cell A10 contains $\text{SIN}(\{0.3, 0.4, 0.5\})$, the result stored in that cell is 0.295520207 ($\text{SIN}(0.3)$). end example]

Array formulas are an extension of the formula paradigm. They allow for combining of several formula operations into one, and the returning of multiple results. Array formulas span one or more cells. There are three primary functions that array formulas perform:

2. Returning multiple results from one single function call. [Example: the function LINEST returns an array of several results, and, therefore, ought to be spanned across several cells as an array formula in order to display those results. end example]
3. Executing one formula several times to generate an array of results. [Example: The array formula $\text{SIN}(A1:A3)$ returns an array with three elements, those being the sines of A1, A2 and A3, respectively. end example]
4. Returning one single result from an operation that incorporated arrays as an intermediate step. [Example: The array formula $\text{SUM}(\text{SIN}(A1:A3))$ returns a single result, that being the SUM of the sines of A1, A2 and A3, respectively. end example]

When an array formula results in a single value, all of the cells spanned by the array formula take on that value. [Example: When the group of cells A10:A12 contains $\text{SIN}(0.3)$, the result stored in each of those cells is 0.295520207. end example]

When an array formula results in multiple values, the designated cells take on corresponding values, according to the shape of the cell group and the values. Specifically,

- If the cell group and values have the same shape (i.e., the same number of rows and columns), each cell takes on the value corresponding to its relative position.
- If the cell group has fewer columns than the values, the left-most columns of the values are stored in the cells.
- If the cell group has fewer rows than the values, the top-most rows of the values are stored in the cells.
- If the cell group has more columns than the values, each cell takes on the value corresponding to its relative position, except that

- For a cell group 1xN array or a two-dimensional array, the excess right-most cells take on an unspecified value.
- For a cell group Nx1 array, the excess columns are clones of the first column.
- If the cell group has more rows than the values, each cell takes on the value corresponding to its relative position, except that:
 - For a cell group Nx1 array or a two-dimensional array, the excess bottom-most cells take on an unspecified value.
 - For a cell group 1xN array, the excess rows are clones of the first row.

[Example: Case 1: The 1x3 group of cells A20:C20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of rows and columns in the group exactly matches the number of rows and columns in the result. Those cells then contain 0.295520207, 0.389418342, and 0.479425539, which correspond to $\text{SIN}(0.3)$, $\text{SIN}(0.4)$, and $\text{SIN}(0.5)$, respectively.

Case 2: The 1x2 group of cells A20:B20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of columns in the group is less than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207 and 0.389418342, which correspond to $\text{SIN}(0.3)$ and $\text{SIN}(0.4)$, respectively, the left-most part of the set of values.

Case 3: The 1x4 group of cells A20:D20 has applied to it the array formula $\text{SIN}(\{0.3, 0.4, 0.5\})$. The number of columns in the group is greater than the number of columns in the result. (The number of rows is the same in each.) Those cells then contain 0.295520207, 0.389418342, 0.479425539, and an unspecified value, which correspond to $\text{SIN}(0.3)$, $\text{SIN}(0.4)$, and $\text{SIN}(0.5)$, respectively, with the fourth value being unspecified.

Case 4: The 2x2 group of cells A30:B31 has applied to it the array formula $\text{SIN}(\{0.1, 0.2, 0.3\})$. The number of columns in the group is less than the number of columns in the result. As a result, the cells in row 30 contain 0.295520207 and 0.389418342, which correspond to $\text{SIN}(0.3)$ and $\text{SIN}(0.4)$, respectively. The number of rows in the group is greater than the number of rows in the result, so the cells in 31 are a copy of the cells in row 30. The left-most part of the set of values is propagated into the cells.

Case 5: The 2x2 group of cells A40:B41 has applied to it the array formula $\text{SIN}(\{0.1, 0.2, 0.3; 0.4, 0.5, 0.6; 0.7, 0.8, 0.9\})$. The number of columns in the group is less than the number of columns in the result. As a result, the left-most column values are stored. The number of rows in the group is less than the number of rows in the result. As a result, the top-most column values are stored. *end example*]

18.17.3 Error values

The evaluation of an expression can result in an error having one of a number of *error values*. These error values are:

| Error Value | Reason for Occurrence |
|-------------|---|
| #DIV/0! | Intended to indicate when any number (including zero) or any error code is divided by zero. |

| Error Value | Reason for Occurrence |
|---------------|--|
| #GETTING_DATA | <p>Intended to indicate when a cell reference cannot be evaluated because the value for the cell has not been retrieved or calculated. [<i>Note: This can happen when connected to an OLAP cube. end note</i>]</p> <p>This error constant differs from #N/A in that #GETTING_DATA is used when there is an expectation that the value for the cell will eventually be available, whereas #N/A is used when there is no such expectation.</p> |
| #N/A | <p>Intended to indicate when a designated value is not available. [<i>Example: Some functions, such as SUMX2MY2, perform a series of operations on corresponding elements in two arrays. If those arrays do not have the same number of elements, then for some elements in the longer array, there are no corresponding elements in the shorter one; that is, one or more values in the shorter array are not available. end example</i>]</p> <p>This error value can be produced by calling the function NA (§18.17.7.223).</p> |
| #NAME? | <p>Intended to indicate when what looks like a name is used, but no such name has been defined. [<i>Example: XYZ/3, where XYZ is not a defined name. Total is & A10, where neither Total nor is is a defined name. Presumably, "Total is " & A10 was intended. SUM(A1C10), where the range A1:C10 was intended. end example</i>]</p> |
| #NULL! | <p>Intended to indicate when two areas are required to intersect, but do not. [<i>Example: In the case of SUM(B1 C1), the space between B1 and C1 is treated as the binary intersection operator, when a comma was intended. end example</i>]</p> |
| #NUM! | <p>Intended to indicate when an argument to a function has a compatible type, but has a value that is outside the domain over which that function is defined. (This is known as a <i>domain error</i>.) [<i>Example: Certain calls to ASIN, ATANH, FACT, and SQRT might result in domain errors. end example</i>]</p> <p>Intended to indicate that the result of a function cannot be represented in a value of the specified type, typically due to extreme magnitude. (This is known as a <i>range error</i>.) [<i>Example: FACT(1000) might result in a range error. end example</i>]</p> |
| #REF! | <p>Intended to indicate when a cell reference cannot be evaluated. [<i>Example: If a formula contains a reference to a cell, and then the row or column containing that cell is deleted, a #REF! error results. If a worksheet does not support 20,001 columns, OFFSET(A1,0,20000) will result in a #REF! error. end example</i>]</p> |
| #VALUE! | <p>Intended to indicate when an incompatible type argument is passed to a function, or an incompatible type operand is used with an operator. [<i>Example: In the case of a function argument, text was expected, but a number was provided end example</i>]</p> |

Each error value has a corresponding *error-constant* (§18.17.2.1).

[*Note*: A number of functions operate on error values: They include `ERROR.TYPE` (§18.17.7.110), `ISERR` (§18.17.7.175), `ISERROR` (§18.17.7.176), and `ISNA` (§18.17.7.179). *end note*]

18.17.4 Dates and Times

Each unique instant in SpreadsheetML time is stored as an ISO 8601-formatted string, which is made up of a date component, a time component, and a timezone component.

Numerous functions take dates and/or times as arguments. Functions that care only about the date shall ignore any time information that is provided. Functions that care only about the time shall ignore any date information that is provided.

[*Example*: The date 22 November 1976 at exactly 08:30 Pacific Standard Time (+08:00 UTC) could be represented in the following (non-exhaustive list of) ways within SpreadsheetML:

1976-11-22T08:30:00,000+08:00

1976-11-22T16:30Z

end example]

For compatibility with existing spreadsheet applications, a consuming application should allow certain numeric serial values to be interpreted as dates and times for display or for use in calculations. These values should behave as defined in §18.17.4.1, §18.17.4.2, and §18.17.4.3.

18.17.4.1 Date Conversion for Serial Values

All date values stored in cells within a SpreadsheetML file are stored in the ISO 8601 format.

For compatibility, a SpreadsheetML application can interpret serial-number values in cells or in formulas as dates. This subclause describes how serial number values can be converted to date values depending on the compatibility mode.

A date that can be interpreted as a numeric value is a *serial value*. This is made up of a signed integer date component and an unsigned fractional time component. Going forward in time, the date component of a serial value increases by 1 each day. A serial value represents a UTC date and time, and, as such, has no timezone information.

Three different bases can be used for converting dates into serial values:

- In the *1900 date base system*, the lower limit is January 1, -9999 00:00:00, which has serial value -4346018. The upper-limit is December 31, 9999, 23:59:59, which has serial value 2,958,465.9999884. The base date for this date base system is December 30, 1899, which has a serial value of 0.
- In the *1900 backward compatibility date-base system*, the lower limit is January 1, 1900, 00:00:00, which has serial value 1. The upper limit is December 31, 9999, 23:59:59, which has serial value 2,958,465.9999884. The base date for this date base system is December 31, 1899, which has a serial value of 0.

- In the *1904 backward compatibility date-base system*, the lower limit is January 1, 1904, 00:00:00, which has serial value 0. The upper limit is December 31, 9999, 23:59:59, which has serial value 2,957,003.9999884. The base date for this date base system is January 1, 1904, which has a serial value of 0.

A serial value outside of the range for its date base system is ill-formed.

[*Note*: The 1900 date-base system is the preferred system to be used by applications when converting serial values to dates. The use of the 1900 backward compatibility or 1904 backward compatibility date-base system should be avoided. *end note*]

The date-base system is recorded in the Workbook part's XML by the presence or absence of the `dateCompatibility` and `date1904` attributes of the `workbookPr` element. [*Example*:

1900 date-base system: `<workbookPr dateCompatibility="0" showObjects="all"/>`

1900 backward compatibility date-base system: `<workbookPr dateCompatibility="1" showObjects="all"/>`

1904 backward compatibility date-base system: `<workbookPr dateCompatibility="1" date1904="1" showObjects="all"/>`

end example]

For legacy reasons, an implementation using the 1900 backward compatibility date base system shall treat 1900 as though it was a leap year. [*Note*: That is, serial value 59 corresponds to February 28, and serial value 61 corresponds to March 1, the next day, allowing the (non-existent) date February 29 to have the serial value 60. *end note*] A consequence of this is that for dates between January 1 and February 28, `WEEKDAY` shall return a value for the day immediately prior to the correct day, so that the (non-existent) date February 29, 1900, has a day-of-the-week that immediately follows that of February 28, and immediately precedes that of March 1, 1900.

[*Example*: For the 1900 date base system:

The serial value -2338.0000000... represents 1893-08-05

The serial value 2.0000000... represents 1900-01-01

The serial value 3687.0000000... represents 1910-02-03

The serial value 38749.0000000... represents 2006-02-01

The serial value 2958465.0000000... represents 9999-12-31

For the 1904 backward compatibility date base system:

The serial value -3800.0000000... represents 1893-08-05

The serial value 0.0000000... represents 1904-01-01

The serial value 2225.0000000... represents 1910-02-03

The serial value 37287.0000000... represents 2006-02-01

The serial value 2957003.0000000... represents 9999-12-31

end example]

18.17.4.2 Time Conversion for Serial Values

The time component of a serial value ranges in value from 0–0.99999999, and represents times from the instant starting 0:00:00 (12:00:00 AM) to the last instant of 23:59:59 (11:59:59 P.M.), respectively.

Going forward in time, the time component of a serial value increases by 1/86,400 each second. [Note: As such, the time 12:00 has a serial value time component of 0.5. *end note]*

[Example:

The serial value 0.0000000... represents 00:00:00

The serial value 0.0000115... represents 00:00:01

The serial value 0.4207639... represents 10:05:54

The serial value 0.5000000... represents 12:00:00

The serial value 0.9999884... represents 23:59:59

end example]

18.17.4.3 Combined Date and Time Conversion for Serial Values

Any date component can be added to any time component to produce a serial value for that date/time combination. The resulting serial value encodes that date whose (positive or negative) time span from base date in the respective date-base equals the serial value.

[Note: In the 1900 date base system, the serial value -1.25 represents December 28, 1899, 18:00. *end note]*

[Example: For the 1900 date base system:

The serial value -2337.999989... represents 1893-08-05T00:00:01Z

The serial value 3687.4207639... represents 1910-02-03T10:05:54Z

The serial value 1.5000000... represents 1900-01-01T12:00:00Z

The serial value 2958465.9999884... represents 9999-12-31T23:59:59Z

For the 1904 backward compatibility date base system:

The serial value -3799.999989... represents 1893-08-05T00:00:01Z

The serial value 2225.4207639... represents 1910-02-03T10:05:54Z

The serial value 0.5000000... represents 1904-01-01T12:00:00Z

The serial value 2957003.9999884... represents 9999-12-31T23:59:59Z

end example]

18.17.5 Limits and Precision

18.17.5.1 Limits

In SpreadsheetML, cell references range from column A1–A1048576 (column A:A) to column XFD1–XFD1048576 (column XFD:XFD).

An implementation can extend this range. However, to avoid ambiguities, it is necessary to ensure that defined names are distinct from cell references, or that one takes precedence over the other. With this in mind, the following rules apply:

- A producer or consumer shall consider a defined name of the form used by cells in the range A1–XFD1048576 to be an error.
- All other names outside this range can be defined names and shall override a cell reference if an ambiguity exists.

[*Example: LOG10* is always a cell reference, *LOG10(...)* is always a formula, and *LOG01000* can be a defined name that overrides a cell reference. *end example*]

18.17.5.2 Precision

In order to clarify the semantics of cell formulas and values in SpreadsheetML, it is necessary to specify the precision of the numbers being represented in the file format. These numbers are therefore regarded as ranging over a specific value space, which defaults to the following:

The *value space* consists of the values $(-1)^s \times m \times 2^n$, where s is 0 or 1, m is an integer greater than or equal to 0 and less than 2^{53} , and n is an integer between -1074 and 971, inclusive. m is herein referred to as the *binary mantissa*, and n is herein referred to as the *binary exponent*. [*Note: The default precision is patterned after the IEC double-precision 64-bit floating-point type [IEC 60559]. end note*]

Implementing applications can use the characteristics markup (§22.7) to specify other value spaces to replace the default in a given workbook. When present in the workbook, the value space defined using the characteristics markup overrides the default value space.

Regardless of the specific value space in use, values shall have a lexical representation as described in §18.17.5.3. Any numerical expression conforming to this lexical description is permitted. However, numbers of higher precision than available in the value space, and numbers that lie outside the range representable in the value space shall be handled as prescribed in §18.17.5.4.

18.17.5.3 Lexical Representation

The value space shall have a lexical representation consisting of a base 10 mantissa followed, optionally, by the character "E" or "e", followed by a base 10 exponent. The exponent shall be an integer. The mantissa shall be a decimal number. The representations for exponent and mantissa shall follow the lexical rules for integer and decimal below. If the "E" or "e" and the following exponent are omitted, an exponent value of 0 is assumed.

Lexical representations for zero can take a positive or negative sign.

[*Example*: -1E4, 1267.43233E12, 12.78e-2, 12, -0, and 0 are all literals for numbers in the default value space. 4503599627370497.5 is also a literal, although it represents the same value as 4503599627370497 ($2^{52} + 1$) in the default value space (as explained in §18.17.5.4). *end example*]

An *Integer* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) with an optional leading sign. If the sign is omitted, "+" is assumed. [*Example*: -1, 0, 12678967543233, +100000. *end example*]

A *Decimal Number* has a lexical representation consisting of a finite-length sequence of decimal digits (#x30–#x39) separated by a period as a decimal indicator. An optional leading sign is allowed. If the sign is omitted, "+" is assumed. Leading and trailing zeroes are optional. If the fractional part is zero, the period and following zero(s) can be omitted. [*Example*: -1.23, 12678967.543233, +100000.00, 210. *end example*]

18.17.5.4 Interpretation

Strings that are permitted according to the lexical definition in §18.17.5.3 shall be interpreted as values in the value space as follows:

1. The mantissa shall be interpreted as a real number expressed in base 10
2. The exponent shall be interpreted as an integer expressed in base 10
3. The raw value for a numerical expression shall be interpreted as
mantissa $\times 10^{\text{exponent}}$
4. If the absolute value is larger than the largest value in the value space (2^{1024} minus 2^{971}) then a consuming application shall treat this as equivalent to the error value #NUM! (§18.17.3). Otherwise the value in the value space that is closest to the raw value is chosen as the interpretation. In the case that two values are equally close, the one with the smaller absolute value is chosen.

18.17.6 XML Representation

18.17.6.1 Cell Reference Style

A workbook saved with reference style A1 (§18.17.2.3.1), shall have the refMode attribute of the calcPr element (§18.2.2) in the Workbook part's XML omitted or set to A1. A workbook saved with reference style R1C1 (§18.17.2.3.2) shall have that refMode attribute set to R1C1. [*Example*: With R1C1 mode set, here is how the XML might look:

```
<workbook ...>
...
  <calcPr calcId="122211" fullCalcOnLoad="1" refMode="R1C1"/>
...
</workbook>
```

end example]

Regardless of the value of the refMode attribute, cell references shall be stored in XML in the A1 form. This attribute's value tells an implementation which reference style to use at runtime.

18.17.6.2 Scalar Formulas

A scalar formula shall be represented in a worksheet's XML by an `f` element that contains the text of the formula, and a `v` element that contains the text version of the last computed value for that formula. This pair of elements shall be inside a `c` element, which is, in turn, shall be inside a `row` element. [Example: Consider the scalar formula `SQRT(C2^2+D2^2)`, where C2 refers to a cell containing the number 12.5, and D2 refers to a cell containing the number 9.6. The corresponding XML might be as follows:

```
<row r="2" spans="2:4">
  <c r="B2" s="40">
    <f>SQRT(C2^2+D2^2)</f>
    <v>15.761027885261798</v>
  </c>
  <c r="C2" s="0">
    <v>12.5</v>
  </c>
  <c r="D2" s="0">
    <v>9.6</v>
  </c>
</row>
```

In the scalar formula `CONCATENATE("The total is ",C7," units")`, C7 refers to a cell containing the number 23. The corresponding XML might be as follows:

```
<row r="7" spans="2:4" ht="285">
  <c r="B7" s="4" t="str">
    <f>CONCATENATE("The total is ",C7," units")</f>
    <v>The total is 23 units</v>
  </c>
  <c r="C7" s="0">
    <v>23</v>
  </c>
</row>
```

As the function `CONCATENATE` returns a string, the value for the cell's `t` attribute is `str`.

end example]

18.17.6.3 Array Formulas

An array formula shall be represented in XML just like other formulas, except that the array formula's `f` element shall contain an attribute `t`, whose value shall be `array`.

For a single-cell formula, the `r` attribute shall designate that cell. [Example: Consider the array formula `SUM(C11:C12*D11:D12)`. The corresponding XML might be as follows:

```

<row r="11" spans="2:4" ht="300">
  <c r="B11" s="16">
    <f t="array" r="B11">SUM(C11:C12*D11:D12)</f>
    <v>110</v>
  </c>
  <c r="C11" s="4">
    <v>10</v>
  </c>
  <c r="D11" s="0">
    <v>3</v>
  </c>
</row>
<row r="12" spans="2:4" ht="285">
  <c r="C12" s="4">
    <v>20</v>
  </c>
  <c r="D12" s="0">
    <v>4</v>
  </c>
</row>

```

As this formula is a single-cell formula, the *r* attribute contains the name of that cell, B11. *end example*]

For an array formula spanning multiple cells, the *r* attribute of the top-left cell of the range of cells to which that formula applies shall designate the range of cells to which that formula applies. The *c* elements for all cells except the top-left cell in that range shall not have an *f* element; however, they shall each have a *v* element.

[*Example*: Consider the array formula A1:A3*B1:B3, which is applied to the cell range C1:C3. The corresponding XML might be as follows:

```

<row r="1" spans="1:3">
  <c r="A1" s="0">
    <v>112</v>
  </c>
  <c r="B1" s="0">
    <v>2.34</v>
  </c>
  <c r="C1" s="0">
    <f t="array" r="C1:C3">A1:A3*B1:B3</f>
    <v>262.08</v>
  </c>
</row>
<row r="2" spans="1:3">
  <c r="A2" s="0">
    <v>209</v>
  </c>

```

```

<c r="B2" s="0">
  <v>1.28</v>
</c>
<c r="C2" s="0">
  <v>267.52</v>
</c>
</row>
<row r="3" spans="1:3">
  <c r="A3" s="0">
    <v>128</v>
  </c>
  <c r="B3" s="0">
    <v>3.12</v>
  </c>
  <c r="C3" s="0">
    <v>399.36</v>
  </c>
</row>

```

As this formula is an array formula spanning multiple cells, the *r* attribute of cell C1 contains the name of that cell range, C1:C3, and cells C2 and C3 do not have an *f* element. *end example*]

18.17.6.4 Formula Evaluation Order

The order in which formulas are evaluated is determined by the order of their corresponding *c* elements in the *calcChain* element of the Calculation Chain part (§18.6.2).

18.17.6.5 Name Representation

A formula can contain one or more names. These names shall be defined in the Workbook part's XML with each being the subject of a *definedName* element, inside a *definedNames* element. [*Example*: Consider the scalar formula `SUM(value1,value2)`. The corresponding XML might be as follows:

```

<definedNames>
  <definedName name="value1" localSheetId="0">Sheet2!$B$2</definedName>
  <definedName name="value2" localSheetId="0">Sheet2!$B$3</definedName>
</definedNames>
...
<c r="E5" s="0">
  <f ce="1">SUM(value1,value2)</f>
  <v>8</v>
</c>

```

end example]

Each name shall be the subject of an *lpstr* element in the Application-Defined File Properties part.

```
<TitlesOfParts>
  <vt:vector ... baseType="lpstr">
    <vt:lpstr>Sheet1</vt:lpstr>
    <vt:lpstr>Sheet2</vt:lpstr>
    <vt:lpstr>Sheet3</vt:lpstr>
    <vt:lpstr>value1</vt:lpstr>
    <vt:lpstr>value2</vt:lpstr>
  </vt:vector>
</TitlesOfParts>
```

18.17.6.6 Value Representation

The most recent value of a formula shall be stored in the corresponding `v` element, as follows:

| Result Type | Representation |
|-------------|---|
| array | The text form of the array's value. |
| error | The text form of the error value. |
| logical | The text 0 for FALSE and 1 for TRUE. |
| number | The unformatted text form of the number, as accurately as possible. |
| text | All of the characters in the text. |

18.17.6.7 Dates and Times

A date and/or time is stored as an ISO 8601 string.

The date base system is recorded in the Workbook part's XML by the `dateCompatibility` and `date1904` attributes of the `workbookPr` element. [Example:

```
1900 date-base: <workbookPr dateCompatibility="false" showObjects="all"/>
1904 backward compatibility date-base: <workbookPr dateCompatibility="true"
  date1904="true" showObjects="all"/>
```

end example]

18.17.7 Predefined Function Definitions

Each of the subclauses below this subclause describes a separate function, and each description contains a section marked **Syntax**. That section contains pieces of the function grammar as they pertain to that specific function. These pieces are presented in a slightly simpler form to aid in the understanding of the description. In those sections, the left-square-bracket and right-square-bracket designate the start and end of an option, as used in ISO/IEC 14977. However, the function-name, the open-parenthesis and the close-parenthesis designate actual literal text, as does each comma. [Note: Therefore, in a strict presentation according to ISO/IEC 14977, each would appear with double-quotes surrounding each instance. *end note]*

The **Syntax** section for each function defined in this subclause corresponds to a call to that function. Except for *argument-list*, the names in any **Syntax** section typeset as in *number* and *string-1*, are parameter names for that

function, and are local to that function definition's description. *argument-list* is the name of a production in the grammar, and, as defined in §18.17.2, permits a comma-separated list of *arguments*.

When the type of an argument passed to a function is incompatible with the type expected the error value #VALUE! is returned by that function.

The set of predefined functions is divided into the following functional categories [Note: The predefined functions defined here reflect current spreadsheet semantics and might not match common practice in other contexts. New functions might be added in future versions of the specification. *end note*]:

All predefined functions can be used with their simple name, with the prefix ECMA., or with the prefix ISO., with the following exception: the predefined function named CEILING in ECMA-376 can only be used with the prefix ECMA.. The predefined function named ISO.CEILING is specified in ECMA-376.

18.17.7.1 ABS

Syntax:

ABS (*x*)

Description: Computes the absolute value of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>x</i> | number | The value whose absolute value is to be determined. |

Return Type and Value: number – The absolute value of *x*.

[Example:

ABS(10.5) results in 10.5

ABS(0) results in 0

ABS(-10.5) results in 10.5

end example]

18.17.7.2 ACCRINT

Syntax:

ACCRINT (*issue* , *first-interest* , *settlement* , *rate* , [*par*] , *frequency* [, [*basis*]])

Description: Computes the accrued interest for a security that pays periodic interest.

Mathematical Formula:

$$ACCRINT = par \times \frac{rate}{frequency} \times \sum_{i=1}^{NC} \frac{A_i}{NL_i}$$

where:

- A_i = number of accrued days for the i^{th} quasi-coupon period within odd period.
- $frequency$ = argument $frequency$
- NC = number of quasi-coupon periods that fit in odd period. If this number contains a fraction, raise it to the next whole number. The quasi-coupon period can be calculated in one of two following ways:
 - Odd long first coupon: by working backwards in time from the long coupon's interest payment date (first coupon date) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number;
 - Odd long last coupon: by working forward in time from the long coupon's interest payment date (last coupon date before redemption) and adding together the number of standard coupon periods that would fit in the long coupon, rounding up to the next whole number.
- NL_i = normal length in days of the i^{th} quasi-coupon period within odd period.
- par = argument par
- $rate$ = argument $rate$

Arguments:

| Name | Type | Description | | | | |
|-----------------------|--|--|-------|-----------------|--------------|--|
| <i>issue</i> | number | The security's issue date. | | | | |
| <i>first-interest</i> | number | The security's first interest date. | | | | |
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>rate</i> | number | The security's annual coupon rate. | | | | |
| <i>par</i> | number | The security's par value. If omitted, 1,000 is used. | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, all dates with a day value of 31 are changed to</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, all dates with a day value of 31 are changed to |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, all dates with a day value of 31 are changed to | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | day 30, including situations where the first date is 28 or 29 February. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays periodic interest.

However, if

- *issue*, *first-interest*, or *settlement* is out of range for the current date base value, #NUM! is returned
- *issue* \geq *settlement*, #NUM! is returned
- *rate* or *par* \leq 0, #NUM! is returned
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned

[Example:

ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,1100,2,0) results in 18.33

ACCRINT(DATE(2006,3,1),DATE(2006,9,1),DATE(2006,5,1),0.1,,2,0) results in 16.67

end example]

18.17.7.3 ACCRINTM

Syntax:

ACCRINTM (*issue* , *settlement* , *rate* , [[*par*] [, [*basis*]]])

Description: Computes the accrued interest for a security that pays interest at maturity.

Mathematical Formula:

$$ACCRINTM = par \times rate \times \frac{A}{D}$$

where:

- *A* = Number of accrued days counted according to a monthly basis. For interest at maturity items, the number of days from the issue date to the maturity date is used.
- *D* = Annual Year Basis.
- *par* = argument *par*
- *rate* = argument *rate*

Arguments:

| Name | Type | Description | | | | |
|-------------------|---|--|-------|-----------------|--------------|---|
| <i>issue</i> | number | The security's issue date. | | | | |
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>rate</i> | number | The security's annual coupon rate. | | | | |
| <i>par</i> | number | The security's par value. If omitted, 1,000 is used. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <p>or 29 February, it is adjusted to 30 February.</p> <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the |

| Name | Type | Description | | |
|------|------|-------------|--|--|
| | | | | <p>following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The accrued interest for a security that pays interest at maturity.

However, if

- *issue* or *settlement* is out of range for the current date base value, #NUM! is returned
- *issue* \geq *settlement*, #NUM! is returned
- *rate* or *par* \leq 0, #NUM! is returned
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned

[Example:

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,1100,0) results in 18.33333333

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,,0) results in 16.66666667

ACCRINTM(DATE(2006,3,1),DATE(2006,5,1),0.1,) results in 16.66666667

end example]

18.17.7.4 ACOS

Syntax:

$$\text{ACOS} (x)$$

Description: Computes the arc cosine of x .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The value whose arc cosine is to be determined. |

Return Type and Value: number – The arc cosine of x , in radians.

However, if x is outside the interval $[-1,+1]$, #NUM! is returned

[Example:

ACOS(-1) results in 3.141592654

ACOS(0) results in 1.570796327

ACOS(1) results in 0

end example]

18.17.7.5 ACOSH

Syntax:

$$\text{ACOSH} (x)$$

Description: Computes the inverse hyperbolic cosine of x .

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value whose inverse hyperbolic cosine is to be determined. |

Return Type and Value: number – The inverse hyperbolic cosine of x .

However, if $x < 1$, #NUM! is returned.

[Example:

ACOSH(1) results in 0

ACOSH(10) results in 2.993222846

ACOSH(100) results in 5.298292366

end example]

18.17.7.6 ADDRESS

Syntax:

ADDRESS (*row-number* , *col-number* [, [*ref-type*] [, [*A1-ref-style-flag*]
[, *sheet-name*]]])

Description: Creates a cell address, given the specified row and column numbers.

Arguments:

| Name | Type | Description | | | | | | | | | | |
|--------------------------|-------------------------------|---|-------|----------------------------|--------------|-------------------------|---|-------------------------------|---|-------------------------------|---|-------------------------|
| <i>row-number</i> | number | The number of the row. | | | | | | | | | | |
| <i>col-number</i> | number | The number of the column. | | | | | | | | | | |
| <i>ref-type</i> | number | The type of reference to return, as follows: <table><tr><th>Value</th><th>Type of Reference Returned</th></tr><tr><td>1 or omitted</td><td>Absolute row and column</td></tr><tr><td>2</td><td>Absolute row; relative column</td></tr><tr><td>3</td><td>Relative row; absolute column</td></tr><tr><td>4</td><td>Relative row and column</td></tr></table> | Value | Type of Reference Returned | 1 or omitted | Absolute row and column | 2 | Absolute row; relative column | 3 | Relative row; absolute column | 4 | Relative row and column |
| Value | Type of Reference Returned | | | | | | | | | | | |
| 1 or omitted | Absolute row and column | | | | | | | | | | | |
| 2 | Absolute row; relative column | | | | | | | | | | | |
| 3 | Relative row; absolute column | | | | | | | | | | | |
| 4 | Relative row and column | | | | | | | | | | | |
| <i>A1-ref-style-flag</i> | logical | The style of the reference. If TRUE or omitted, an A1-style reference (§18.17.2.3.1) is returned; otherwise, an R1C1-style reference (§18.17.2.3.2) is returned. | | | | | | | | | | |
| <i>sheet-name</i> | text | The name of the worksheet to be used. If omitted, no sheet name is used. | | | | | | | | | | |

Return Type and Value: text – A cell address, given the specified row and column numbers.

However, if

- *row-number* or *col-number* < 1, #NUM! is returned.
- *ref-type* is outside the range 1–4, #NUM! is returned.

[Example:

In A1-reference style mode:

ADDRESS(5,7,1) results in \$G\$5
ADDRESS(5,7,2) results in G\$5
ADDRESS(5,7,3) results in \$G5
ADDRESS(5,7,4) results in G5
ADDRESS(5,7,,,"Sheet1") results in Sheet1!\$G\$5

In R1C1-reference style mode:

ADDRESS(5,7,1,FALSE) results in R5C7
ADDRESS(5,7,2,FALSE) results in R5C[7]
ADDRESS(5,7,3,FALSE) results in R[5]C7
ADDRESS(5,7,4,FALSE) results in R[5]C[7]

end example]

18.17.7.7 AMORDEGRC

Syntax:

AMORDEGRC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* ,
 rate [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account. The function is similar to AMORLINC (§18.17.7.7), except that a depreciation coefficient is applied in the calculation depending on the life of the assets.)

Arguments:

| Name | Type | Description | | | | |
|-----------------------|--|--|-------|-----------------|--------------|--|
| <i>cost</i> | number | The cost of the asset. | | | | |
| <i>date-purchased</i> | number | The date of the purchase of the asset. | | | | |
| <i>first-period</i> | number | The date of the end of the first period. | | | | |
| <i>salvage</i> | number | The salvage value at the end of the life of the asset. | | | | |
| <i>period</i> | number | The period. | | | | |
| <i>rate</i> | number | The rate of depreciation. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <p>the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <p>Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Return Type and Value: number – The depreciation for each accounting period.

However, if

- *cost, salvage, period, or rate* < 0, #NUM! is returned.
- *date-purchased* or *first-period* is out of range for the current date base value, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.
- The life of the assets is between 0 and 1, 1 and 2, 2 and 3, or 4 and 5, #NUM! is returned.

This function returns the depreciation until the last period of the life of the assets or until the cumulated value of depreciation is greater than the cost of the assets minus the salvage value.

The depreciation coefficients are:

| Life of assets (1/rate) | Depreciation Coefficient |
|-------------------------|--------------------------|
| Between 3 and 4 years | 1.5 |
| Between 5 and 6 years | 2 |
| More than 6 years | 2.5 |

The depreciation rate grows to 50 percent for the period preceding the last period, and grows to 100 percent for the last period.

[Example:

AMORDEGRC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1) results in 776.00

end example]

18.17.7.8 AMORLINC

Syntax:

AMORLINC (*cost* , *date-purchased* , *first-period* , *salvage* , *period* ,
rate [, [*basis*]])

Description: Computes the depreciation for each accounting period. (This function is provided for the French accounting system. If an asset is purchased in the middle of the accounting period, the prorated depreciation is taken into account.)

Arguments:

| Name | Type | Description | | | | |
|-----------------------|---|--|-------|-----------------|--------------|---|
| <i>cost</i> | number | The cost of the asset. | | | | |
| <i>date-purchased</i> | number | The date of the purchase of the asset. | | | | |
| <i>first-period</i> | number | The date of the end of the first period. | | | | |
| <i>salvage</i> | number | The salvage value at the end of the life of the asset. | | | | |
| <i>period</i> | number | The period. | | | | |
| <i>rate</i> | number | The rate of depreciation. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <p>30 February.</p> <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> If the date |

| Name | Type | Description | | |
|------|------|-------------|--|--|
| | | | | <p>is 28 or 29 February, it is adjusted to 30 February.</p> <ul style="list-style-type: none"> For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Return Type and Value: number – The depreciation for each accounting period.

However, if:

- *cost*, *salvage*, *period*, or *rate* < 0, #NUM! is returned.
- *date-purchased* or *first-period* is out of range for the current date base value, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

AMORLINC(2400,DATE(2008,8,19),DATE(2008,12,31),300,1,0.15,1) results in 360.00

end example]

18.17.7.9 AND

Syntax:

AND (*argument-list*)

Description: Tests if all *arguments* in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

Arguments:

| Name | Type | Description |
|----------------------|-----------------------------------|---|
| <i>argument-list</i> | logical, array, or cell reference | The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored. |

Return Type and Value: logical – TRUE if all *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, #VALUE! is returned.

[Example:

AND(TRUE) results in TRUE

AND(TRUE, FALSE) results in FALSE

AND(10>5, 3=1+2, 5) results in TRUE

AND({10, 5, 6, 7}, TRUE, E6:F6) results in TRUE, when E6 contains TRUE and F6 contains 10

end example]

18.17.7.10 AREAS

Syntax:

AREAS (*reference*)

Description: Finds the number of areas (§18.17.2.3) designated by *reference*.

Arguments:

| Name | Type | Description |
|------------------|-----------|---|
| <i>reference</i> | reference | A reference to a single cell or to a range of cells that can refer to multiple areas. |

Return Type and Value: number – The number of areas designated by *reference*.

However, if the reference designates no areas, #NUM! is returned.

[Example:

AREAS(E312) results in 1

AREAS(E311:F313) results in 1

AREAS((E312:F314,G316:H316,G311)) results in 3, given the union of the three areas

AREAS((E312:F314 E313:F314 F312:F314)) results in 1, given the intersection of the three areas

end example]

18.17.7.11 ASC

Syntax:

ASC (*string*)

Description: For double-byte character set (DBCS) languages, converts all full-width (double-byte) characters to half-width (single-byte) characters.

Arguments:

| Name | Type | Description |
|---------------|------|---|
| <i>string</i> | text | Designate the text to be converted. If <i>string</i> does not contain any full-width characters, nothing in <i>string</i> is converted. |

Return Type and Value: text – The text resulting from the conversion.

[Example:

ASC("ABC") results in ABC

ASC("エクセル") results in エクセル

end example]

18.17.7.12 ASIN

Syntax:

ASIN (*x*)

Description: Computes the arc sine of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>x</i> | number | The value whose arc sine is to be determined. |

Return Type and Value: number – The arc sine of *x*, in radians.

However, if *x* is outside the interval [-1,+1], #NUM! is returned.

[Example:

ASIN(-1) results in -1.570796327

ASIN(0) results in 0

ASIN(1) results in 1.570796327

end example]

18.17.7.13 ASINH

Syntax:

ASINH (x)

Description: Computes the inverse hyperbolic cosine of x .

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value whose inverse hyperbolic sine is to be determined. |

Return Type and Value: number – The inverse hyperbolic cosine of x .

[Example:

ASINH(1) results in 0.881373587

ASINH(10) results in 2.99822295

ASINH(100) results in 5.298342366

ASINH(0.5) results in 0.481211825

end example]

18.17.7.14 ATAN

Syntax:

ATAN (x)

Description: Computes the arc tangent of x .

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value whose arc tangent is to be determined. |

Return Type and Value: number – The arc tangent of x , in radians.

[Example:

ATAN(-1) results in -0.785398163

ATAN(0) results in 0

ATAN(1) results in 0.785398163

ATAN(-10) results in 1.471127674

ATAN(10) results in 1.471127674

end example]

18.17.7.15 ATAN2

Syntax:

ATAN2 (x , y)

Description: Computes the arc tangent of the coordinates x and y .

Arguments:

| Name | Type | Description |
|------|--------|------------------------|
| x | number | The first coordinate. |
| y | number | The second coordinate. |

Return Type and Value: number – The arc tangent of y/x , in radians.

However, if both x and y are zero, #DIV/0! is returned.

[Example:

ATAN2(1,1) results in 0.785398163

ATAN2(-2,2) results in 2.35619449

ATAN2(3,-3) results in -0.785398163

end example]

18.17.7.16 ATANH

Syntax:

ATANH (x)

Description: Computes the inverse hyperbolic tangent of x .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The value whose inverse hyperbolic tangent is to be determined. |

Return Type and Value: number – The inverse hyperbolic tangent of x .

However, if x is outside the interval $[-1,+1]$, #NUM! is returned.

[Example:

ATANH(-0.999999) results in -7.254328619

ATANH(0) results in 0

ATANH(0.999999) results in 7.254328619

end example]

18.17.7.17 AVEDEV

Syntax:

AVEDEV (*argument-list*)

Description: Computes the average of the absolute deviations of a set of data points from their mean. AVEDEV is a measure of the variability in a data set.

Mathematical Formula:

The average of the absolute deviations of a set of data points from their mean is as follows:

$$\frac{1}{n} \sum |x - \bar{x}|$$

where:

- n = the number of *arguments* in *argument-list*
- x = an *argument* in *argument-list*
- \bar{x} = the x mean value

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, array, or reference that contains a number. The list | The <i>arguments</i> in <i>argument-list</i> designate the values for which the average of the absolute deviations is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, |

| Name | Type | Description |
|------|---|---|
| | can be a single argument that is an array or a reference to an array. | logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The average of the absolute deviations of a set of data points from their mean.

[Example:

AVEDEV(-3.5,1.4,6.9,-4.5) results in 4.075

AVEDEV({-3.5,1.4,6.9,-4.5}) results in 4.075

end example]

18.17.7.18 AVERAGE

Syntax:

AVERAGE (*argument-list*)

Description: Computes the arithmetic mean of the numeric values of its arguments.

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, text, or reference that contains a number. | The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. If an array or cell reference argument contains logical values, text, or empty cells, those values shall be ignored; however, cells having the value 0 shall be counted. [Note: The function AVERAGEA (§18.17.7.18) does include cell reference arguments that refer to logical values or text representations of numbers. end note] |

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[Example:

AVERAGE(1,2,3,4,5) results in 3

AVERAGE({1,2;3,4}) results in 2.5

AVERAGE({1,2,3,4,5},6,"7") results in 4

AVERAGE({1, "2", TRUE, 4}) results in 2.5, as the logical value and numeric text are ignored

end example]

18.17.7.19 AVERAGEA

Syntax:

AVERAGEA (*argument-list*)

Description: Computes the arithmetic mean of the values of its arguments.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, text, or reference that contains a number. | The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. An argument that is a logical value or the text representation of a number shall be counted. Arguments with value TRUE evaluate to 1; arguments with value FALSE evaluate to 0. An array or cell reference argument that contains text evaluates to 0. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored. |

[*Note:* The function AVERAGE (§18.17.7.18) does not include cell reference arguments that refer to logical values or text representations of numbers. *end note*]

Return Type and Value: number – The arithmetic mean of the values of its arguments.

[*Example:*

AVERAGEA(10, E1), where E1 is an empty cell, results in 10, as E1 is ignored

AVERAGEA(10, E2), where E2 contains TRUE, results in 5.5

AVERAGEA(10, E3), where E3 contains FALSE, results in 5

end example]

18.17.7.20 AVERAGEIF

Syntax:

AVERAGEIF (*cell-range* , *selection-criteria* [, *average-range*])

Description: Applies selection criteria on the values in one range of cells and averages the values of the cells in a corresponding range.

Arguments:

| Name | Type | Description |
|---------------------------|-------------------------------------|---|
| <i>cell-range</i> | reference | The range of cells to be inspected. Cells in <i>cell-range</i> that contain TRUE or FALSE are ignored. If a cell is an empty cell, it is ignored. |
| <i>selection-criteria</i> | number, expression, reference, text | Designates the cells that are to be averaged. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). If a cell in <i>selection-criteria</i> is empty, it is treated as if it contained 0. |
| <i>average-range</i> | reference | Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range</i> . The actual cells that are averaged are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If <i>average-range</i> is omitted, <i>cell-range</i> also designates the cells whose values are averaged. If a cell is an empty cell, it is ignored. |

Return Type and Value: number – The average of the values of the cells corresponding to those selected.

However, if no cells in the range meet the criteria, the return value is unspecified.

[Example: Assuming A2:A4 contains 10, 20, and 30:

AVERAGEIF (A2:A4, ">15") results in 25, the average of 20 and 30.

end example]

18.17.7.21 AVERAGEIFS

Syntax:

AVERAGEIFS (*average-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: The average of the values of all cells that meet multiple criteria.

Arguments:

| Name | Type | Description |
|-----------------------------|-------------------------------------|---|
| <i>average-range</i> | reference | Designates the cells whose values are averaged. In this case, <i>average-range</i> need not have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>average-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . If a cell in <i>average-range</i> is empty, that cell is ignored. Each cell in <i>average-range</i> is used in the average calculation only if all of the corresponding criteria specified are true for that cell. |
| <i>cell-range-1</i> | number, expression, reference, text | Designates the first range of cells to be inspected. |
| <i>selection-criteria-1</i> | reference, text | <i>selection-criteria-1</i> specifies the criteria for the first range of cells that is averaged. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. If a cell in any selection criteria range is empty, it is treated as if its value was 0. Cells that contain TRUE evaluate to 1; cells in any range that contain FALSE evaluate to 0. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). |
| <i>cell-range-n</i> | number, expression, reference, text | The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively. |
| <i>selection-criteria-n</i> | reference, text | |

Return Type and Value: number – The average of the cells corresponding to those selected.

However, if

- Cells in *average-range* are empty or contain text values that cannot be translated into numbers, the return value is unspecified.
- There are no cells that meet all the criteria, the return value is unspecified.

[Example: Given the following data:

| | A | B | C | D |
|---|------------|------------------|-------------------|------------------|
| 1 | Student | First Quiz Grade | Second Quiz Grade | Final Exam Grade |
| 2 | Emilio | 75 | 85 | 87 |
| 3 | Julie | 94 | 80 | 88 |
| 4 | Hans | 86 | 93 | Incomplete |
| 5 | Frederique | Incomplete | 75 | 75 |

AVERAGEIFS(B2:B5,B2:B5,">70",B2:B5,"<90") results in 80.5 (the average for all students all first quiz grades that are between 70 and 90)

AVERAGEIFS(D2:D5,D2:D5,"<>Incomplete",D2:D5,">80") results in 87.5 (the average for all students all first quiz grades that are above 80 and not marked "Incomplete")

AVERAGEIFS(B2:D5,B2:B5,"<>Incomplete",C2:C5,"<>Incomplete",D2:D5, "<>Incomplete") results in 82.375 (the average grades for all students who do not have incomplete grades)

end example]

18.17.7.22 BAHTTEXT

Syntax:

BAHTTEXT (*number*)

Description: Produces a string containing *number* formatted according to the Thai convention.

Arguments:

| Name | Type | Description |
|---------------|--------|----------------------------|
| <i>number</i> | number | The value to be formatted. |

Return Type and Value: text – The text containing *number* formatted.

[Example:

BAHTTEXT(1234) results in หนึ่งพันสองร้อยสามสิบสี่บาทถ้วน

end example]

18.17.7.23 BESSELI

Syntax:

BESSELI (*x* , *n*)

Description: The modified Bessel function $I_n(x)$, which is equivalent to the Bessel function $J_n(x)$ evaluated for purely imaginary arguments.

Mathematical Formula:

The n -th order modified Bessel function of the variable x is:

$$I_n(x) = (i)^{-n} J_n(ix)$$

where:

- x = argument x
- n = argument n

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value at which to evaluate the function. |
| n | number | The order of the Bessel function. This value is truncated to an integer. |

Return Type and Value: number – The Bessel function $I_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELI(-5.6,0) results in 46.73755194

BESSELI(2.345,5) results in 0.023137792

end example]

18.17.7.24 BESSELJ

Syntax:

BESSELJ (x , n)

Description: The Bessel function $J_n(x)$.

Mathematical Formula:

The n -th order Bessel function of the variable x is:

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

where:

$$\Gamma(n + k + 1) = \int_0^{\infty} e^{-x} x^{n+k} dx$$

is the Gamma function, and

- x = argument x
- n = argument n

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value at which to evaluate the function. |
| n | number | The order of the Bessel function. This value is truncated to an integer. |

Return Type and Value: number – The Bessel function $J_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELJ(-5.6,0) results in 0.026970887

BESSELJ(2.345,5) results in 0.014627862

end example]

18.17.7.25 BESSELK

Syntax:

BESSELK (x , n)

Description: The modified Bessel function $K_n(x)$, which is equivalent to using the Bessel function $J_n(x)$ and $Y_n(x)$.

Mathematical Formula:

The n -th order modified Bessel function of the variable x is:

$$K_n(x) = \frac{p}{2} i^{n+1} [J_n(ix) + iY_n(ix)]$$

where:

- J_n is the J Bessel function
- n = argument n

- $p = \pi$
- x = argument x
- Y_n is the Y Bessel function
- **Arguments:**

| Name | Type | Description |
|------|--------|--|
| x | number | The value at which to evaluate the function. |
| n | number | The order of the Bessel function. This value is truncated to an integer. |

Return Type and Value: number – The Bessel function $K_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELK(2.345,5) results in 3.904137225

end example]

18.17.7.26 BESSELY

Syntax:

BESSELY (x , n)

Description: Weber's Bessel function $Y_n(x)$.

Mathematical Formula:

The n -th order Bessel function of the variable x is:

$$Y_n(x) = \lim_{v \rightarrow n} \frac{J_v(x) \cos(v \pi) - J_{-v}(x)}{\sin(v \pi)}$$

where:

- n = argument n
- x = argument x

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The value at which to evaluate the function. |
| n | number | The order of the Bessel function. This value is truncated to an integer. |

Return Type and Value: number – The Weber's Bessel function $Y_n(x)$.

However, if $n < 0$, #NUM! is returned.

[Example:

BESSELY(2.345,5) results in -4.98977884

end example]

18.17.7.27 BETADIST

Syntax:

BETADIST (x , $alpha$, $beta$ [, [A] , [B]])

Description: Computes the cumulative beta probability density function.

Arguments:

| Name | Type | Description |
|---------|--------|--|
| x | number | The value between A and B at which to evaluate the function. |
| $alpha$ | number | A parameter of the distribution. |
| $beta$ | number | A parameter of the distribution. |
| A | number | The lower bound to the interval of x . If omitted, the lower bound is 0. |
| B | number | The upper bound to the interval of x . If omitted, the upper bound is 1. |

Return Type and Value: number – The cumulative beta probability density function.

However, if

- $alpha$ or $beta \leq 0$, #NUM! is returned.
- $x < A$, $x > B$, or $A = B$, #NUM! is returned.

[Example:

BETADIST(0.5,1,2) results in 0.75

BETADIST(0.5,1,2,-4.5,7.3) results in 0.66791152

BETADIST(0.5,1,2,,2.3) results in 0.387523629

end example]

18.17.7.28 BETAINV

Syntax:

BETAINV (*probability* , *alpha* , *beta* [, [*A*] , [*B*]])

Description: Computes the inverse of the cumulative distribution function for a specified beta distribution. Given a value for *probability*, BETAINV is used to seek for the value x such that $\text{BETADIST}(x, \alpha, \beta, A, B) = \text{probability}$. Thus, precision of BETAINV depends on precision of BETADIST.

Arguments:

| Name | Type | Description |
|--------------------|--------|--|
| <i>probability</i> | number | A probability associated with the beta distribution. |
| <i>alpha</i> | number | A parameter of the distribution. |
| <i>beta</i> | number | A parameter of the distribution. |
| <i>A</i> | number | The lower bound to the interval of x . If omitted, the lower bound is 0. |
| <i>B</i> | number | The upper bound to the interval of x . If omitted, the upper bound is 1. |

Return Type and Value: number – The inverse of the cumulative distribution function for a specified beta distribution.

However, if

- α or $\beta \leq 0$, #NUM! is returned.
- $\text{probability} < 0$ or $\text{probability} > 1$, #NUM! is returned.
- The search has not converged after some implementation-defined number of iterations, #N/A is returned.

[Example:

BETAINV(0.5,1,2) results in 0.29289341

BETAINV(0.5,1,2,-4.5,7.3) results in -1.043857765

BETAINV(0.5,1,2,,2.3) results in 0.673654842

end example]

18.17.7.29 BIN2DEC

Syntax:

BIN2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

| Name | Type | Description |
|---------------|--------|--|
| <i>number</i> | number | A 10-digit binary number that is to be converted to a decimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit. |

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (-512 decimal) to 0111111111 (511 decimal), inclusive, #NUM! is returned.

[Example:

BIN2DEC(111) results in 7

BIN2DEC(11111111) results in 255

BIN2DEC(1111111110) results in -2

BIN2DEC(1000000000) results in -512

end example]

18.17.7.30 BIN2HEX

Syntax:

BIN2HEX (*number* [, *num-hex-digits*])

Description: Makes the uppercase hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

| Name | Type | Description |
|---------------|--------|--|
| <i>number</i> | number | A 10-digit binary number that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly |

| Name | Type | Description |
|-----------------------|--------|---|
| | | 10 digits. The 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit. |
| <i>num-hex-digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer. |

Return Type and Value: text – The uppercase hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (200 hex, -512 decimal) to 011111111 (1FF hex, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

BIN2HEX(1) results in 1

BIN2HEX(1,4) results in 0001

BIN2HEX(111111) results in 3F

BIN2HEX(1111000000) results in FFFFFFFC0

BIN2HEX(1000000000,3) results in FFFFFFFE00

end example]

18.17.7.31 BIN2OCT

Syntax:

BIN2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

| Name | Type | Description |
|---------------|--------|--|
| <i>number</i> | number | A 10-digit binary number that is to be converted to an octal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The |

| Name | Type | Description |
|-----------------------|--------|--|
| | | 10 digits use twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit. |
| <i>num-oct-digits</i> | number | <i>num-oct-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer. |

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* contains one or more non-binary digits, #NUM! is returned.
- *number* contains more than 10 binary digits; that is, *number* is outside the range 1000000000 (1000 octal, -512 decimal) to 0111111111 (0777 octal, 511 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* < 0 or > 10, #NUM! is returned.

[Example:

BIN2OCT(1) results in 1

BIN2OCT(1,4) results in 0001

BIN2OCT(111111) results in 77

BIN2OCT(1111000000) results in 7777777700

BIN2OCT(1000000000,3) results in 7777777000

end example]

18.17.7.32 BINOMDIST

Syntax:

BINOMDIST (*number-successes* , *number-trials* , *success-probability* , *cumulative-flag*)

Description: Computes the individual term binomial distribution probability.

Mathematical Formula:

The binomial probability mass function is:

$$b(x, n, p) = \binom{n}{x} p^x (1 - p)^{n-x}$$

where:

$$\binom{n}{x}$$

is COMBIN(*n*, *x*).

The cumulative binomial distribution is:

$$B(x, n, p) = \sum_{y=0}^x b(y, n, p)$$

where:

- *n* = argument *number-trials*
- *p* = argument *success-probability*
- *x* = argument *number-successes*

Arguments:

| Name | Type | Description |
|----------------------------|---------|---|
| <i>number-successes</i> | number | The number of successes in <i>number-trials</i> , truncated to an integer. |
| <i>number-trials</i> | number | The number of independent trials, truncated to an integer. |
| <i>success-probability</i> | number | The probability of success on each trial. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, then the cumulative distribution function is returned, which is the probability that there are at most <i>number-successes</i> successes; if FALSE, the probability mass function is returned, which is the probability that there are <i>number-successes</i> successes. |

Return Type and Value: number – The individual term binomial distribution probability.

However, if

- *number-successes* < 0 or *number-successes* > *number-trials*, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

BINOMDIST(6,10,0.5,FALSE) results in 0.205078125

BINOMDIST(6,10,0.5,TRUE) results in 0.828125

end example]

18.17.7.33 CEILING

Syntax:

CEILING (x , *significance*)

Description: Computes a value that is x rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of x , a value is rounded up when adjusted away from zero.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| x | number | The value to be rounded |
| <i>significance</i> | number | The multiple to which x is to be rounded. If x is negative, and <i>significance</i> is negative, then the value is rounded down (away from zero). If x is negative, and <i>significance</i> is positive, then the value is rounded up, towards zero. |

Return Type and Value: number – The rounded-up value of x .

However, if x and *significance* have different signs, #NUM! is returned.

[Example:

CEILING(2.5,1) rounds 2.5 up to nearest multiple of 1; that is, to 3

CEILING(-2.5,-2) rounds -2.5 up to nearest multiple of -2; that is, to -4

CEILING(1.5,0.1) rounds 1.5 up to the nearest multiple of 0.1; that is, to 1.5

CEILING(0.234,0.01) rounds 0.234 up to the nearest multiple of 0.01; that is, to 0.24

end example]

18.17.7.34 CELL

Syntax:

CELL (*category* [, *reference*])

Description: Retrieves information about the formatting, location, or contents of the upper-left cell indicated by *reference*. *category* indicates the kind of information to be retrieved.

Arguments:

| Name | Type | Description |
|------------------|-----------|---|
| <i>category</i> | text | The category string as defined in the table following. |
| <i>reference</i> | reference | Refers to the cell whose category information is being requested. If <i>reference</i> is a cell range, the first cell in that range is the cell whose category information is being requested. If <i>reference</i> is omitted, the information retrieved pertains to the most recent cell whose value was changed. For the category "format", if <i>reference</i> designates a cell formatted with a built-in number format, the number format string is as defined in the table following. |

| <i>category</i> | Meaning | Result Type |
|-----------------|--|----------------|
| "address" | Reference of the first cell in <i>reference</i> . | text |
| "col" | Column number of the cell in <i>reference</i> . | number |
| "color" | 1 if the cell is formatted in color for negative values; otherwise, 0. 0 if the cell does not contain a number. | number |
| "contents" | Value of the upper-left cell in <i>reference</i> . | Text or number |
| "filename" | Fully qualified filename of the file that contains <i>reference</i> . However, if the worksheet that contains <i>reference</i> has not yet been saved, the filename is an empty string. | text |
| "format" | Number format of the cell. (See the discussion of formats below.) The number format string has "-" appended if the cell is formatted in color for negative values. The number format string has "(" appended if the cell is formatted in color for positive or all values. | text |
| "parentheses" | 1 if the cell is formatted with parentheses for positive or all values; otherwise, 0. 0 if the cell does not contain a number. | number |
| "prefix" | Text value corresponding to the label prefix of the cell, as follows: <ul style="list-style-type: none"> • Single quotation mark (') if the cell contains left-aligned text • Double quotation mark (") if the cell contains right-aligned text • Caret (^) if the cell contains centered text • Backslash (\) if the cell contains fill-aligned text • Empty string if the cell contains anything else | text |
| "protect" | 0 if the cell is not locked; otherwise, 1. | number |
| "row" | Row number of the cell in <i>reference</i> . | number |
| "type" | Text value corresponding to the type of data in the cell. | text |

| <i>category</i> | Meaning | Result Type |
|-----------------|--|-------------|
| | <ul style="list-style-type: none"> "b" (blank) if the cell is empty "l" (label) if the cell contains a text constant "v" (value) if the cell contains anything else | |
| "width" | Column width of the cell rounded off to an integer. Each unit of column width is equal to the width of one character in the default font size. | number |

If the SpreadsheetML is intended to be used in certain non-English locales, the *category* string can be the English value shown in the table above, or the translation shown in the following table. Locales not specified in the table below shall only use the English versions of the *category* string.

[Note: Using translated versions of the *category* string is strongly discouraged, as spreadsheet applications might not support these translations. *end note*]

| Locale | address | col | color | contents | filename | format |

Return Type and Value: various (see table above) – The value corresponding to *category*, and whose type is shown in the category value table above.

When the category parameter is "format", then the value returned depends upon the number format of the upper-left cell of *reference*, and, more specifically, upon the number format code of the upper-left cell of *reference*. Depending upon the number format code of the appropriate cell, the result value of CELL when the category is "format" is based upon the rules defined below.

First, some observations regarding the rules are in order:

- The various "sections" of the number format code are referred to within the rules. For more information on sections in the number format code, see numFmts (Number Formats) (§18.8.31).
- There are cases in which it is useful to discuss the characters from the number format code that are dependent upon the value in the cell. Instead of representing text or spacing in the cell's display text, these characters interpret, in some fashion, the value to be displayed. In the rules, these characters are referred to as "interpreted characters" of the number format code. The following table shows all the interpreted characters:

| Interpreted Characters |
|------------------------|
| 0 |
| # |
| @ |
| d |
| m |
| y |
| h |
| s |
| ? |
| AM/PM |
| A/P |
| g |
| e |
| r |

- There are cases in which it is also useful to discuss runs of similar interpreted characters. [Example: Each "d", "m", and "y" within the number format code "dd/mm/yyyy" does not represent a separate

interpretation of the day of the date value to be represented, and instead helps to make up a representation of the day of the date that is two digits in length. *end example*] These runs of similar characters are referred to below as “interpreted symbols” since multiple characters are used, but the result is a single symbolic representation of at least part of the value.

- Since there are multiple different symbols for days, months, years, hours, minutes, seconds, and AM/PM, it is sometimes useful to discuss all of the representations of each of these. When any of "Day", "Month", "Year", "Hour", "Minute", etc., is referred to within a rule, what is meant is any of the possible representations for that date/time portion. For example, a “Day” symbol would be any of d, dd, ddd, or dddd.
- The use of characters such as "0", "E", and "%" as a symbol within a number format code does not include usages of these same characters either escaped (by preceding them with a backslash character "\") or as a part of a quoted string.

Here are the rules to determine the result value:

1. If the first interpreted symbols within the first section are any of the date or time characters (any of "y", "m", "d", "h", "m", "s") then the first one or two characters of the return value are determined by the order of interpreted symbols (including any interpreted symbols, not just date/time symbols) according to the following table. ("anything" can mean "no additional symbols". If the type is "anything except <type>", then the excepted symbol type cannot follow the previously specified symbol.)

| Interpreted Symbols in Order | Return Value Characters |
|---|--|
| Day, month, year, anything | "D1" |
| Day, month, anything besides year, anything | "D2" |
| Month, year, anything | "D3" |
| Month, day, year, anything | "D4" |
| Month, day, anything besides year, anything | "D5" |
| Hours, minutes, seconds, AM/PM, anything | "D6" |
| Hours, minutes, AM/PM, anything | "D7" |
| Hours, minutes, seconds, anything besides AM/PM, anything | "D8" |
| Hours, minutes, anything besides seconds or AM/PM, anything | "D9" |
| Any other combination of symbols | "G" or "C" depending on whether there is a \$ in the first condition |

2. Otherwise, the first character of the return value is determined based upon the referenced cell's number format code according to the rules in the table below:

| First Section of the Number Format Code | | First Return Value Character |
|--|--|------------------------------|
| Absent Characters (as Symbols) | Present Characters (as Symbols) | |
| | @ | "G" |
| @ | \$ | "C" |
| @, \$ | % | "P" |
| @, \$, % | E | "S" |
| @, \$, %, E | A run of any combination of one or more "0", "#", and "?" characters, followed by a comma, followed by a run of any combination of one or more "0", "#", and "?" characters. This run can not be preceded by a period (".") or by any interpreted characters. | "," |
| @, \$, %, E, or a run of characters containing a comma as described in the row above | At least one of "0", "?", or "#" | "F" |
| Any of the above conditions | Anything | "G" |

3. The final value is determined by appending any of the applicable characters from the table below to the return value characters obtained from the previous two tables:

| Case | Characters to Append |
|--|---|
| The first character of the return value is C, F, S, P, or "," and the number format code contains any of "?", "0", or "#" as a symbol. | The decimal number equal to the total number of "#", "?", and "0" characters to the right of the first "." within the first section |
| The first character of the return value was C, and the number format code does not contain any of "?", "0", or "#" as a symbol. | 15 or the length of the string immediately following the first "\$" sign in the number format code that is a symbol. |
| The first section of the number format code contains an open parenthesis "(" as a symbol. | "("" |
| The second section of the number format code contains [Red], [Black], [Green], [White], [Blue], | "_" |

| Case | Characters to Append |
|---|----------------------|
| [Magenta], [Yellow], or [Cyan] as a symbol. | |

However, if *category* is not one of the defined values, #VALUE! is returned.

[Example:

CELL("address",A10) might result in \$E\$289
CELL("contents",A10:B10), results in xxx, when A10 contains xxx, and B10 contains anything
CELL("filename",A10) might result in E:\Formulas\[Test.xlsx]Sheet1
CELL("format",A10) results in G, when A10 contains xxx
CELL("format",A10) results in F2-, when A10 contains (123.00)
CELL("format",A10) results in C3-, when A10 contains \$123,456.780
CELL("format",A10) results in S3, when A10 contains 1.235E+05
CELL("prefix",A10) results in ', when A10 contains xxx
CELL("type",A10) results in l, when A10 contains xxx

end example]

18.17.7.35 CHAR

Syntax:

CHAR (*x*)

Description: Determines the character that is represented by the value *number*. On the Macintosh platform, the Macintosh character set is used. On all other platforms, the Latin character set with IANA name iso-8859-1 is used.

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>x</i> | number | A value in the range 1–255, which designates the character. |

Return Type and Value: text – The character represented by the value *number*.

[Example:

CHAR(65) results in A
CHAR(A10) results in A, when A10 contains 65

end example]

18.17.7.36 CHIDIST

Syntax:

CHIDIST (x , *degrees-freedom*)

Description: Computes the one-tailed probability of the chi-squared distribution.

Mathematical Formula:

$$CHIDIST = P(X > x)$$

where:

- X = an χ^2 random variable
- x = argument x

Arguments:

| Name | Type | Description |
|------------------------|--------|--|
| x | number | The value at which the distribution is to be evaluated. |
| <i>degrees-freedom</i> | number | The number of degrees of freedom, truncated to an integer. |

Return Type and Value: number – The one-tailed probability of the chi-squared distribution.

However, if

- $x < 0$, #NUM! is returned.
- *degrees-freedom* < 1 or *degrees-freedom* > 10^{10} , #NUM! is returned.

[Example:

CHIDIST(3.5,4) results in 0.47787835

CHIDIST(12.34,7) results in 0.089917721

end example]

18.17.7.37 CHIINV

Syntax:

CHIINV (*probability* , *degrees-freedom*)

Description: Computes the inverse of the one-tailed probability of the chi-squared distribution. Given a value for *probability*, CHIINV seeks for a value x such that $\text{CHIDIST}(x, \text{degrees-freedom}) = \text{probability}$. Thus, precision of CHIINV depends on precision of CHIDIST.

Arguments:

| Name | Type | Description |
|------------------------|--------|---|
| <i>probability</i> | number | A probability associated with the chi-squared distribution. |
| <i>degrees-freedom</i> | number | The number of degrees of freedom, truncated to an integer. |

Return Type and Value: number – The inverse of the one-tailed probability of the chi-squared distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom* < 1 or *degrees-freedom* ≥ 10¹⁰, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[Example:

CHIINV(0.5,4) results in 3.356694001

CHIINV(0.3,7) results in 8.38343064

end example]

18.17.7.38 CHITEST

Syntax:

CHITEST (*actual-range* , *expected-range*)

Description: Computes the test for independence. CHITEST returns the value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

Mathematical Formula:

The χ^2 test first calculates a χ^2 statistic using the formula:

$$\chi^2 = \sum_{i=1}^r \sum_{j=1}^c \frac{(A_{ij} - E_{ij})^2}{E_{ij}}$$

where:

- A_{ij} = actual frequency in the i -th row, j -th column of the argument *actual-range*

- c = number of columns in argument *actual-range* (or argument *expected-range*)
- E_{ij} = expected frequency in the i -th row, j -th column of the argument *expected-range*
- r = number of rows in argument *actual-range* (or argument *expected-range*)

CHITEST uses the χ^2 distribution with an appropriate number of degrees of freedom, df . If $r > 1$ and $c > 1$, then $df = (r - 1)(c - 1)$. If $r = 1$ and $c > 1$, then $df = c - 1$ or if $r > 1$ and $c = 1$, then $df = r - 1$.

Arguments:

| Name | Type | Description |
|-----------------------|-----------|--|
| <i>actual-range</i> | reference | The range of data that contains observations to test against expected values. |
| <i>expected-range</i> | reference | The range of data that contains the ratio of the product of row totals and column totals to the grand total. |

Return Type and Value: number – The value from the chi-squared distribution for the statistic and the appropriate degrees of freedom.

However, if:

- The number of rows and columns is exactly one, the return value is unspecified.
- *actual-range* and *expected-range* have a different number of data points, #N/A is returned.

[Example: Given the following data:

| | A | B | C |
|---|----------------|------------------|-------------|
| 1 | Men (Actual) | Women (Actual) | Description |
| 2 | 58 | 35 | Agree |
| 3 | 11 | 25 | Neutral |
| 4 | 10 | 23 | Disagree |
| 5 | Men (Expected) | Women (Expected) | Description |
| 6 | 45.35 | 47.65 | Agree |
| 7 | 17.56 | 18.44 | Neutral |
| 8 | 16.09 | 16.91 | Disagree |

CHITEST(A2:B4,A6:B8) results in 0.000308

end example]

18.17.7.39 CHOOSE

Syntax:

CHOOSE (*index* , *argument-list*)

Description: Selects the *argument* in *argument-list* that corresponds by position to *index*.

Arguments:

| Name | Type | Description |
|----------------------|--------|---|
| <i>index</i> | number | An index into <i>argument-list</i> , truncated to an integer. The value of <i>index</i> shall be in the position range 1– <i>n</i> , where <i>argument-1</i> is position 1, <i>argument-2</i> is position 2, and so on up to <i>argument-n</i> . If <i>index</i> is an array, the value or every element in that array is evaluated, and if the formula is an array formula, the result is an array of chosen values. |
| <i>argument-list</i> | any | The <i>arguments</i> in any given <i>argument-list</i> need not all have the same type. |

Return Type and Value: any, including array – The *argument* in *argument-list* that corresponds by position to *index*.

However, if the value of *index* is not an index into *argument-list*, #VALUE! is returned.

[Example:

CHOOSE(E7,F7,G7,H7,I7,J7,K7,L7) results in Monday, when E7 contains 2, and the cells F7:L7 each contain the names of the week, from Sunday to Saturday

SUM(CHOOSE(E1,F20:G20,H20:J24)) results in the sum of the elements designated by F20:G20 or H20:J24, as determined by the value of E1

If B9:B11 contain 1, 3, and 3, respectively, and CHOOSE(B9:B11,10,20,30) is an array formula spanning 3 cells, the values of those 3 cells is 10, 30, and 30, respectively.

end example]

18.17.7.40 CLEAN

Syntax:

CLEAN (*string*)

Description:

Makes a string that is a copy of *string* with all so-called "non-printable" characters—those with internal values in the range U+0000–001F—removed.

Arguments:

| Name | Type | Description |
|---------------|------|-------------------------------------|
| <i>string</i> | text | Designate the string to be cleaned. |

Return Type and Value: text – The trimmed copy of *string*.

[Example:

CLEAN("A" & CHAR(2) & "BC") results in ABC, which is stored in A10
 LEN(A10) results in 3

end example]

18.17.7.41 CODE

Syntax:

CODE (*string*)

Description: Determines the numeric code of the first character in *string*.

Arguments:

| Name | Type | Description |
|---------------|------|--|
| <i>string</i> | text | Designates a string containing one or more characters. |

Return Type and Value: number – The numeric code of the first character in *string*.

However, if *string* is empty, #VALUE! is returned.

[Example:

CODE("abc") results in 97
 CODE(A10) results in 97, when A1 contains abc

end example]

18.17.7.42 COLUMN

Syntax:

COLUMN ([*reference*])

Description: Finds the number of the column(s) corresponding to *reference*.

Arguments:

| Name | Type | Description |
|------------------|-----------|---|
| <i>reference</i> | reference | A reference to a single cell or to a range of contiguous cells. If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula. |

Return Type and Value: number – If *reference* refers to a single cell or to a single column of cells, the corresponding column is returned. If *reference* refers to a range of cells involving multiple columns, a horizontal array of the corresponding columns as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

COLUMN() results in 4, when the cell containing the formula is in column 4

COLUMN(E17:E19) results in 5

COLUMN(E16:F17) results in a horizontal array containing 5 and 6, respectively

end example]

18.17.7.43 COLUMNS

Syntax:

COLUMNS (*array*)

Description: Finds the number of columns corresponding to *array*.

Arguments:

| Name | Type | Description |
|--------------|------------------|-------------|
| <i>array</i> | array, reference | Any array. |

Return Type and Value: number – The number of columns corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.

[Example:

COLUMNS(E16:F16) results in 2

COLUMNS(E16:G18) results in 3

COLUMNS({1,2;3,4}) results in 2

end example]

18.17.7.44 COMBIN

Syntax:

COMBIN (*number* , *number-chosen*)

Description: Computes the possible number of groups of size *number-chosen* that can be formed from *number* objects. [*Note:* A combination is any set or subset of objects, regardless of their internal order. Combinations are distinct from permutations, for which the internal order is significant. *end note*]

Mathematical Formula:

The number of combinations is as follows, where *number* = *n* and *number-chosen* = *k*:

$$\binom{n}{k} = \frac{P_{k,n}}{k!} = \frac{n!}{k!(n-k)!}$$

where:

$$P_{k,n} = \frac{n!}{(n-k)!}$$

where:

- *k* = argument *number-chosen*
- *n* = argument *number*

Arguments:

| Name | Type | Description |
|----------------------|--------|---|
| <i>number</i> | number | The total number of objects available, truncated to an integer. |
| <i>number-chosen</i> | number | The number of objects in each combination, truncated to an integer. |

Return Type and Value: number – The number of different combinations of *number-chosen* in *number*.

However, if

- *number* < 0, #NUM! is returned.
- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[Example:

COMBIN(8,2) results in 28

COMBIN(10,4) results in 210

COMBIN(6,5) results in 6

end example]

18.17.7.45 COMPLEX

Syntax:

COMPLEX (*real-number* , *imaginary-number* [, *suffix*])

Description: Makes a complex number in $x + yi$ or $x + yj$ text format from the arguments.

Arguments:

| Name | Type | Description |
|-------------------------|--------|--------------------------------------|
| <i>real-number</i> | number | The real number coefficient. |
| <i>imaginary-number</i> | number | The imaginary number coefficient. |
| <i>suffix</i> | text | "i" or "j". If omitted, "i" is used. |

Return Type and Value: text – The complex number string specified by the arguments.

If *real-number* has the value 0 and *imaginary-number* has a non-zero value, the resulting string contains just the real number. If *real-number* has a non-zero value and *imaginary-number* has a zero value, the resulting string contains just the imaginary number and suffix. If both *real-number* and *imaginary-number* have a zero value, the resulting string is "0".

However, if *suffix* is neither "i" nor "j", #VALUE! is returned.

[Example:

COMPLEX(-3.5,19.6) results in -3.5+19.6i

COMPLEX(3.5,-19.6,"j") results in 3.5-19.6j

COMPLEX(3.5,0) results in 3.5

COMPLEX(0,2.4) results in 2.4i

COMPLEX(0,0) results in 0

end example]

18.17.7.46 CONCATENATE

Syntax:

CONCATENATE (*argument-list*)

Description: Makes a string that is the concatenation of all the strings corresponding to the *arguments* in *argument-list*, taken left-to-right.

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>argument-list</i> | text | Each <i>argument</i> in <i>argument-list</i> shall designate a string. |

Return Type and Value: text – The concatenated string.

[Example:

CONCATENATE("text") results in text

CONCATENATE("The total is ",A10," units") results in The total is 43 units, when A10 contains 43

CONCATENATE(3," + ",4," = ",3+4) results in 3 + 4 = 7

end example]

18.17.7.47 CONFIDENCE

Syntax:

CONFIDENCE (*alpha* , *standard-dev* , *size*)

Description: Computes a value that can be used to construct a confidence interval for a population mean. The CONFIDENCE function assumes a normal distribution for calculation.

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>alpha</i> | number | The significance level used to compute the confidence level. |
| <i>standard-dev</i> | number | The population standard deviation for the data range. |
| <i>size</i> | number | The sample size, truncated to an integer. |

Return Type and Value: number – A value that can be used to construct a confidence interval for a population mean.

However, if

- $\alpha \leq 0$ or $\alpha \geq 1$, #NUM! is returned.
- $\text{standard-dev} \leq 0$, #NUM! is returned.
- $\text{size} < 1$, #NUM! is returned.

[Example:

CONFIDENCE(0.4,5,12) results in 1.214775614

CONFIDENCE(0.75,9,7) results in 1.083909234

end example]

18.17.7.48 CONVERT

Syntax:

CONVERT (*number* , *from-unit* , *to-unit*)

Description: Converts a number from one measurement system to another.

Arguments:

| Name | Type | Description |
|------------------|--------|---|
| <i>number</i> | number | The value to be converted from <i>from-units</i> to <i>to-units</i> . |
| <i>from-unit</i> | text | The unit to be converted from, where the permitted string values are shown in the tables below. |
| <i>to-unit</i> | text | The unit to be converted to, where the permitted string values are shown in the tables below. |

| Weight and Mass | |
|--------------------|--------------------------|
| <i>Unit String</i> | <i>Meaning</i> |
| g | Gram |
| lbm | Pound mass (avoirdupois) |
| ozm | Ounce mass (avoirdupois) |
| sg | Slug |
| u | U (atomic mass unit) |

| Distance | |
|--------------------|----------------|
| <i>Unit String</i> | <i>Meaning</i> |
| ang | Angstrom |
| ft | Foot |
| in | Inch |

| Distance | |
|----------|-------------------|
| m | Meter |
| mi | Statute mile |
| Nmi | Nautical mile |
| Pica | Point (1/72 inch) |
| yd | Yard |

| Time | |
|--------------------|----------------|
| <i>Unit String</i> | <i>Meaning</i> |
| day | Day |
| hr | Hour |
| mn | Minute |
| sec | Second |
| yr | Year |

| Pressure | |
|--------------------|----------------|
| <i>Unit String</i> | <i>Meaning</i> |
| at or atm | Atmosphere |
| mmHg | mm of Mercury |
| P or p | Pascal |

| Force | |
|--------------------|----------------|
| <i>Unit String</i> | <i>Meaning</i> |
| dy or dyn | Dyne |
| lbf | Pound force |
| N | Newton |

| Energy | |
|--------------------|-----------------------|
| <i>Unit String</i> | <i>Meaning</i> |
| BTU or btu | BTU _{IT} |
| c | Thermodynamic calorie |
| cal | IT calorie |
| e | Erg |

| Energy | |
|-----------|-----------------|
| ev or eV | Electron volt |
| flb | Foot-pound |
| HPh or hh | Horsepower-hour |
| J | Joule |
| Wh or wh | Watt-hour |

| Power | |
|--------------------|----------------|
| <i>Unit String</i> | <i>Meaning</i> |
| H or hp | Horsepower |
| W or w | Watt |

| Magnetism | |

| US_tbs | U.S. tablespoon | ½ US_oz | 14.78676 ml |
| US_tsp | U.S. teaspoon | 1/6 US_oz | 4.928922 ml |

The following abbreviated unit prefixes can be used with any metric unit:

| Abbreviated Unit Prefixes | |
|---------------------------|----------------|
| <i>Prefix String</i> | <i>Meaning</i> |
| E | exa (1E+18) |
| P | peta (1E+15) |
| T | tera (1E+12) |
| G | giga (1E+09) |
| M | mega (1E+06) |
| k | kilo (1E+03) |
| h | hecto (1E+02) |
| e | deka (1E+01) |
| d | deci (1E-01) |
| c | centi (1E-02) |
| m | milli (1E-03) |
| u | micro (1E-06) |
| n | nano 1E-09) |
| p | pico (1E-12) |
| f | femto (1E-15) |
| a | atto (1E-18) |

Unit names and prefixes are case-sensitive.

Return Type and Value: number – The value of *number* in *from-units* converted to *to-units*.

However, if

- The value of *from-unit* or *to-unit* is not one of the defined values, #N/A is returned.
- The *from-unit* and *to-unit* are from different measurement categories, #N/A is returned.
- The value of *from-unit* or *to-unit* has an abbreviated unit prefix, yet none is supported for that unit, #N/A is returned.

[Example:

```

CONVERT(10, "ozm", "g") results in 283.4951521
CONVERT(1, "yd", "mm") results in 914.4000003
CONVERT(1, "yd", "cm") results in 91.44000003
CONVERT(1, "yd", "m") results in 0.9144
CONVERT(1, "yd", "km") results in 0.0009144
CONVERT(1, "mi", "Nmi") results in 0.868976242
CONVERT(1, "day", "sec") results in 86400
CONVERT(0, "K", "C") results in -273.15

```

end example]

18.17.7.49 CORREL

Syntax:

CORREL (*array-1* , *array-2*)

Description: Computes the correlation coefficient of the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The equation for the correlation coefficient is:

$$\text{Correl}(X, Y) = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where

- x = a sample value
- \bar{x} = the sample mean AVERAGE(*array-1*)
- y = a sample value
- \bar{y} = the sample mean AVERAGE(*array-2*)

Arguments:

| Name | Type | Description |
|----------------|------------------|---|
| <i>array-1</i> | array, reference | The first cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>array-2</i> | array, reference | The second cell range. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The correlation coefficient of the cells in two cell ranges.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* and *array-2* is empty, the return value is unspecified.
- The standard deviation of the values in *array-1* or *array-2* equals zero, the return value is unspecified.

[Example:

CORREL({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7}) results in -0.714976

end example]

18.17.7.50 COS

Syntax:

COS (*x*)

Description: Computes the cosine of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|--|
| <i>x</i> | number | The value, in radians, whose cosine is to be determined. |

Return Type and Value: number – The cosine of *x*.

[Example:

COS(-1) results in 0.540302306

COS(0) results in 1

COS(1) results in 0.540302306

end example]

18.17.7.51 COSH

Syntax:COSH (x)**Description:** Computes the hyperbolic cosine of x .**Arguments:**

| Name | Type | Description |
|------|--------|--|
| x | number | The value whose hyperbolic cosine is to be determined. |

Return Type and Value: number – The hyperbolic cosine of x .However, if the magnitude of x is too large, #NUM! is returned.

[Example:

COSH(-1) results in 1.543080635

COSH(0) results in 1

COSH(1) results in 1.543080635

end example]

18.17.7.52 COUNT

Syntax:COUNT (*argument-list*)**Description:** Counts the number of *arguments* in *argument-list* that contain numbers, and the number of cells referred to by *arguments* in *argument-list*, which contain numbers.**Arguments:**

| Name | Type | Description |
|----------------------|------|--|
| <i>argument-list</i> | text | Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments that are numbers, logical values, dates, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, text, or error values in the array or reference shall be ignored. [Note: To count logical values, text, or error values as well, use the COUNTA (§18.17.7.53) function. end note] |

Return Type and Value: number – The numeric argument and reference to numeric argument count.

[Example:

COUNT(1,2,3,4,5) results in 5
COUNT({1,2,3,4,5}) results in 5
COUNT({1,2,3,4,5},6,"7") results in 7
COUNT(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNT(10,E2), where E2 contains TRUE, results in 1, as E2 is ignored

end example]

18.17.7.53 COUNTA

Syntax:

COUNTA (*argument-list*)

Description: Counts the number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>argument-list</i> | text | Each <i>argument</i> in <i>argument-list</i> designates a value. Arguments with values of any type shall be counted. However, empty cells shall not be counted. If an argument is an array or reference, only values in that array or reference shall be counted. Empty cells and text values in the array or reference shall be ignored. [Note: To exclude logical values, text, or error values, use the COUNT (§18.17.7.52) function. <i>end note</i>] |

Return Type and Value: number – The number of arguments that are not cell references, and the number of cells, referred to by arguments, which are not empty.

[Example:

COUNTA(1,2,3,4,5) results in 5
COUNTA({1,2,3,4,5}) results in 15
COUNTA({1,2,3,4,5},6,"7") results in 7
COUNTA(10,E1), where E1 is an empty cell, results in 1, as E1 is ignored
COUNTA(10,E2), where E2 contains TRUE, results in 2, as E2 is counted

end example]

18.17.7.54 COUNTBLANK

Syntax:

COUNTBLANK (*cell-range*)

Description: Counts the number of cells in a specified range of cells, which are empty. A cell containing a formula that returns an empty string is counted, whereas a cell containing a zero value is not.

Arguments:

| Name | Type | Description |
|-------------------|-----------|--|
| <i>cell-range</i> | reference | Designates the range of cells to be inspected. |

Return Type and Value: number – The number of empty cells in the range specified.

[Example:

COUNTBLANK(A2:C2), where A2 and B2 are empty, but C2 is not, results in 2

end example]

18.17.7.55 COUNTIF

Syntax:

COUNTIF (*cell-range* , *selection-criteria*)

Description: Counts the number of cells in a specified range of cells, whose values meet the specified criteria.

Arguments:

| Name | Type | Description |
|---------------------------|-------------------------------------|--|
| <i>cell-range</i> | reference | Designates the range of cells to be inspected. |
| <i>selection-criteria</i> | number, expression, reference, text | Designates the cells to be counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). |

Return Type and Value: number – The number of cells in the range specified that meet the criteria.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

COUNTIF(A1:D1, "=10") results in 2

COUNTIF(A1:D1, ">5") results in 3

COUNTIF(A1:D1, "<>10") results in 2

Given that A2, B2, C2, and D2, respectively, contain the values apples, oranges, grapes, and melons

COUNTIF(A2:D2, "*es") results in 3

COUNTIF(A2:D2, "?a*") results in 2

COUNTIF(A2:D2, "*1*") results in 2

end example]

18.17.7.56 COUNTIFS

Syntax:

COUNTIFS (*count-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: Counts the number of cells within a range that meet multiple criteria.

Arguments:

| Name | Type | Description |
|-----------------------------|-------------------------------------|---|
| <i>count-range</i> | reference | Designates the cells whose values are included. <i>count-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>count-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . |
| <i>cell-range-1</i> | reference | Designates the first range of cells to be inspected. Each cell in a range is counted only if all of the corresponding criteria specified are true for that cell. |
| <i>selection-criteria-1</i> | number, expression, reference, text | Designates the first range of cells to be counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). |

| Name | Type | Description |
|-----------------------------|-------------------------------------|--|
| <i>cell-range-n</i> | reference | The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively. |
| <i>selection-criteria-n</i> | number, expression, reference, text | |

If a cell in any argument is an empty cell, it is treated as if it had the value 0.

Return Type and Value: number – The count of the cells corresponding to those selected.

[Example: Given the following data:

| | A | B | C | D |
|---|--------------|-----------------------|-----------------------|----------------------|
| 1 | Sales Person | Exceeded Tables Quota | Exceeded Chairs Quota | Exceeded Desks Quota |
| 2 | Davolio | Yes | No | No |
| 3 | Buchanan | Yes | Yes | No |
| 4 | Suyama | Yes | Yes | Yes |
| 5 | Leverling | No | Yes | Yes |

COUNTIFS(B2:D2, "=Yes") results in 1 (counts how many times Davolio exceeded a sales quota for tables, chairs, and desks)

COUNTIFS(B2:B5, "=Yes", C2:C5, "=Yes") results in 2 (counts how many sales people exceeded both their tables and chairs quota)

COUNTIFS(B5:D5, "=Yes", B3:D3, "=Yes") results in 1 (counts how many times Leverling and Buchanan exceeded the same quota for tables, chairs, and desks)

end example]

18.17.7.57 COUPDAYBS

Syntax:

COUPDAYBS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the beginning of the coupon period to the settlement date.

Arguments:

| Name | Type | Description |
|-------------------|--------|---------------------------------|
| <i>settlement</i> | number | The security's settlement date. |

| Name | Type | Description | | | | | | |
|------------------|--|--|-------|-----------------|--------------|--|---|--|
| <i>maturity</i> | number | The security's maturity date. | | | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the |
| Value | Day Count Basis | | | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | | | | | | | |
| 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar y. |

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days from the beginning of the coupon period to the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPDAYBS (DATE (2007, 1, 25), DATE (2008, 11, 15), 2, 1) results in 71

COUPDAYBS (DATE (2007, 1, 25), DATE (2008, 11, 15), 2) results in 70

end example]

18.17.7.58 COUPDAYS

Syntax:

COUPDAYS (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days in the coupon period that contains the settlement date.

Arguments:

| Name | Type | Description | | | | |
|-------------------|---|---|-------|-----------------|--------------|---|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February. |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February. | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> If the date is 28 or 29 |

| Name | Type | Description | | |
|------|------|-------------|--|---|
| | | | | February, it is adjusted to 30 February. <ul style="list-style-type: none">• For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The number of days in the coupon period that contains the settlement date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPDAYS (DATE (2007,1,25),DATE (2008,11,15),2,1) results in 181

COUPDAYS (DATE (2007,1,25),DATE (2008,11,15),2) results in 180

end example]

18.17.7.59 COUPDAYSNC

Syntax:

COUPDAYSNC (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of days from the settlement date to the next coupon date.

Arguments:

| Name | Type | Description | | | | | | |
|-------------------|--|--|-------|-----------------|--------------|--|---|--|
| <i>settlement</i> | number | The security's settlement date. | | | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. [Example:

COUPDAYSNC (DATE (2007,1,25),DATE (2008,11,15),2,1) results in 110

COUPDAYSNC (DATE (2007,1,25),DATE (2008,11,15),2) results in 110

end example]

18.17.7.60 COUPNCD

COUPNCD (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the next coupon date after the settlement date.

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|--|-------|-----------------|--------------|--|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | |

Time information in the date arguments is ignored.

Return Type and Value: number – The next coupon date after the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

COUPNCD(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 15-May-2007

end example]

18.17.7.61 COUPNUM

COUPNUM (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole number.

Arguments:

| Name | Type | Description | | | | | | |
|-------------------|--|--|-------|-----------------|--------------|--|---|--|
| <i>settlement</i> | number | The security's settlement date. | | | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The number of coupons payable between the settlement date and maturity date, rounded up to the nearest whole coupon.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPNUM(DATE(2007,1,25),DATE(2008,11,15),2,1) results in 4

end example]

18.17.7.62 COUPPCD

COUPPCD (*settlement* , *maturity* , *frequency* [, [*basis*]])

Description: Computes the previous coupon date before the settlement date.

Arguments:

| Name | Type | Description | | | | |
|-------------------|---|---|-------|-----------------|--------------|---|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February. |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February. | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> If the date is 28 or 29 |

| Name | Type | Description | | |
|------|------|-------------|--|---|
| | | | | February, it is adjusted to 30 February. <ul style="list-style-type: none">• For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The previous coupon date before the settlement date, as a date.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

COUPPCD (DATE (2007,1,25),DATE (2008,11,15),2,1) results in 15-Nov-2006

end example]

18.17.7.63 COVAR

Syntax:

COVAR (array-1 , array-2)

Description: Computes covariance; that is, the average of the products of deviations for each data point pair in the two cell ranges designated by *array-1* and *array-2*.

Mathematical Formula:

The covariance is:

$$\text{Cov}(X, Y) = \frac{\sum (x - \bar{x})(y - \bar{y})}{n}$$

where

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean `AVERAGE(array-1)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(array-2)`

Arguments:

| Name | Type | Description |
|----------------|--|--|
| <i>array-1</i> | number, name, array, reference to number | If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>array-2</i> | | |

Return Type and Value: number – The covariance.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

`COVAR({2.532,5.621;2.1,3.4},{5.32,2.765;5.2,6.7})` results in -1.375374

end example]

18.17.7.64 CRITBINOM

Syntax:

`CRITBINOM (number-trials , success-probability , alpha)`

Description: Computes the smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

Arguments:

| Name | Type | Description |
|----------------------------|--------|---|
| <i>number-trials</i> | number | The number of Bernoulli trials. |
| <i>success-probability</i> | number | The probability of success on each trial. |
| <i>alpha</i> | number | The criterion value. |

Return Type and Value: number – The smallest value for which the cumulative binomial distribution is greater than or equal to a criterion value.

However, if

- *number-trials* < 0, #NUM! is returned.
- *success-probability* is < 0 or *success-probability* > 1, #NUM! is returned.
- *alpha* < 0 or *alpha* > 1, #NUM! is returned.

[Example:

CRITBINOM(6,0.5,0.75) results in 4

CRITBINOM(12,0.3,0.95) results in 6

end example]

18.17.7.65 CUBEKPIMEMBER

Syntax:

CUBEKPIMEMBER (*connection* , *kpi-name* , *kpi-property* [, [*caption*]])

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, a Key Performance Indicator (KPI) name, property, and measure, and displays the name and property in the cell. A KPI is a quantifiable measurement, such as monthly gross profit or quarterly employee turnover, used to monitor an organization's performance.

Arguments:

| Name | Type | Description | | | | |
|---------------------|-----------------------------------|---|-------|-------------|---|-----------------------------------|
| <i>connection</i> | text | The name of the connection to the cube. | | | | |
| <i>kpi-name</i> | text | The name of the KPI in the cube. | | | | |
| <i>kpi-property</i> | number | <div>The KPI component to be returned, truncated to integer; it shall be one of the following:<table><tr><th>Value</th><th>Description</th></tr><tr><td>1</td><td>The actual value, at the time the</td></tr></table></div> | Value | Description | 1 | The actual value, at the time the |
| Value | Description | | | | | |
| 1 | The actual value, at the time the | | | | | |

| Name | Type | Description | |
|----------------|------|---|---|
| | | | function is executed. |
| | | 2 | A target value of the KPI, which can be compared to the actual value in order to determine if the underlying indicator is meeting its goal. |
| | | 3 | The state of the KPI at a specific moment in time |
| | | 4 | A measure of the value over time |
| | | 5 | The relative importance assigned to the KPI on the server. If this KPI is assigned a parent KPI, then this number can be used on the server to proportionally adjust the results of this KPI value when calculating the value of the parent KPI. While this number can be shown in the spreadsheet application, it is assumed that it is used by the server for any calculations affecting the KPI. |
| | | 6 | The unique name of the member in the time dimension that defines the timeframe of the KPI. [Example: A KPI could be associated with the first quarter of the year 2007. end example] |
| | | If 1 is specified, only <i>kpi-name</i> is displayed in the cell. | |
| <i>caption</i> | text | An alternative string whose value is displayed in the cell instead of <i>kpi-name</i> and <i>kpi-property</i> . | |

Return Type and Value: any – The selected key performance indicator.

However, if

- *kpi-name* is not the name of a KPI in the cube, the return value is unspecified.
- *kpi-property* is outside the range 1–6, #N/A is returned.
- The *connection* name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.

[Example:

```
CUBEKPIMEMBER("Sales","MySalesKPI",1)
CUBEKPIMEMBER("Sales","MySalesKPI",2,"Sales KPI Goal")
```

end example]

18.17.7.66 CUBEMEMBER

Syntax:

CUBEMEMBER (*connection* , *member-expression* , [, [*caption*]])

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the member or tuple defined by *member-expression*. [Note: This function is used to ensure that the member or tuple exists in the cube. end note]

When a call to CUBEMEMBER is used as an argument to another CUBExxx function, the MDX expression that identifies the member or tuple is used by that CUBExxx function, rather than the displayed value in the cell of the CUBEMEMBER function.

Arguments:

| Name | Type | Description |
|--------------------------|------------------------|--|
| <i>connection</i> | text | The name of the connection to the cube. |
| <i>member-expression</i> | text, reference, array | A multidimensional expression (MDX) that evaluates to a unique member in the cube. Alternatively, <i>member-expression</i> can be a tuple, specified as a cell range or an array constant. [Note: MDX is a standard query language for OLAP cubes. end note] |
| <i>caption</i> | text | The string displayed in the cell instead of the caption from the cube (assuming it defines such a caption). When a tuple is returned, the caption used is the one for the last member in the tuple. |

Return Type and Value: any – A member or tuple in a cube hierarchy.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.

- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```
CUBEMEMBER("Sales","[Time].[Fiscal].[2004]")
CUBEMEMBER($A$1,D$12)
CUBEMEMBER("Sales",(B4,C6,D5),"SalesFor2004")
CUBEMEMBER("Sales",{[Products].[Food];[Time].[Fiscal].[2004]})
CUBEMEMBER($A$1,C$12:D$12)
```

end example]

18.17.7.67 CUBEMEMBERPROPERTY

Syntax:

CUBEMEMBERPROPERTY (*connection* , *member-expression* , *property*)

Description: Fetches a property of a member in the OLAP cube on an OLAP server. [Note: Use this function to ensure that a member name exists within the cube and to return the specified property for this member. *end note*]

Arguments:

| Name | Type | Description |
|--------------------------|------|--|
| <i>connection</i> | text | The name of the connection to the cube. |
| <i>member-expression</i> | text | A multidimensional expression (MDX) that evaluates to a unique member in the cube. [Note: MDX is a standard query language for OLAP cubes. <i>end note</i>] |
| <i>property</i> | text | The name of the property returned or a reference to a cell that contains the name of the property. |

Return Type and Value: any – A property of a member in the OLAP cube.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.

- The member specified by *member-expression* doesn't exist in the cube, the return value is unspecified.

[Example:

```
CUBEMEMBERPROPERTY("Sales","[Time].[Fiscal].[2004]",$A$3)
CUBEMEMBERPROPERTY("Sales","[Store].[MyFavoriteStore]",
"[Store].[Store Name].[Store Sqft]")
```

end example]

18.17.7.68 CUBERANKEDMEMBER

Syntax:

CUBERANKEDMEMBER (*connection* , *set-expression* , *rank* [, *caption*])

Description: Fetches the n^{th} , or ranked, member in a set.

Arguments:

| Name | Type | Description |
|-----------------------|--------|---|
| <i>connection</i> | text | The name of the connection to the cube. |
| <i>set-expression</i> | text | A set expression, such as "[{Item1}.children]". |
| <i>rank</i> | number | Specifies the top value to return, truncated to integer. If 1, the top value is returned; if 2, the second-most top value is returned; and so on. |
| <i>caption</i> | text | The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption). |

Return Type and Value: any – The n^{th} member in the set.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified. , the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```
CUBERANKEDMEMBER("Sales",$D$4,1,"Top Month")
```

```
CUBERANKEDMEMBER("Sales",CUBESET("Sales","Summer","[2004].[June]",
"[2004].[July]","[2004].[August]"),3,"Top Month")
```

end example]

18.17.7.69 CUBESET

Syntax:

```
CUBESET ( connection , set-expression [ , [ caption ] [ , [ sort-order ]
[ , [ sort-by ] ] ] )
```

Description: Fetches from the OLAP cube on the OLAP server designated by *connection* the set of members or tuples that is defined by *set-expression*. [Note: Use this function to build dynamic reports that aggregate and filter data, by using the return value as a slicer in the CUBEVALUE function, the CUBERANKEDMEMBER function to choose specific members from the calculated set, and the CUBESETCOUNT function to control the size of the set. *end note]*

Arguments:

| Name | Type | Description | | | | | | | | | | | | | | | |
|-----------------------|---|--|-------|-------------|-------------------------|--------------|----------------------------------|---------|---|--|----------|---|---|----------|---|---|---------|
| <i>connection</i> | text | The name of the connection to the cube. | | | | | | | | | | | | | | | |
| <i>set-expression</i> | text, reference | A set expression that results in a set of members or tuples. <i>set-expression</i> can also be a cell reference to range that contains one or more members, tuples, or sets included in the set. | | | | | | | | | | | | | | | |
| <i>caption</i> | text | The text displayed in the cell instead of the caption from the cube (assuming it defines such a caption). | | | | | | | | | | | | | | | |
| <i>sort-order</i> | text | The type of sort, if any, to perform; it can be one of the following: <table> <tr> <th>Value</th><th>Description</th><th><i>sort-by</i> argument</th></tr> <tr> <td>0 or default</td><td>Leaves the set in existing order</td><td>Ignored</td></tr> <tr> <td>1</td><td>Sorts set in ascending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>2</td><td>Sorts set in descending order by <i>sort_by</i></td><td>Required</td></tr> <tr> <td>3</td><td>Sorts set in alphabetic ascending order</td><td>Ignored</td></tr> </table> | Value | Description | <i>sort-by</i> argument | 0 or default | Leaves the set in existing order | Ignored | 1 | Sorts set in ascending order by <i>sort_by</i> | Required | 2 | Sorts set in descending order by <i>sort_by</i> | Required | 3 | Sorts set in alphabetic ascending order | Ignored |
| Value | Description | <i>sort-by</i> argument | | | | | | | | | | | | | | | |
| 0 or default | Leaves the set in existing order | Ignored | | | | | | | | | | | | | | | |
| 1 | Sorts set in ascending order by <i>sort_by</i> | Required | | | | | | | | | | | | | | | |
| 2 | Sorts set in descending order by <i>sort_by</i> | Required | | | | | | | | | | | | | | | |
| 3 | Sorts set in alphabetic ascending order | Ignored | | | | | | | | | | | | | | | |

| Name | Type | Description | | | |
|----------------|------|---|---|--|---------|
| | | | 4 | Sorts set in alphabetic descending order | Ignored |
| | | | 5 | Sorts set in natural ascending order | Ignored |
| | | | 6 | Sorts set in natural descending order | Ignored |
| | | | An alphabetic sort for a set of tuples sorts on the last element in each tuple. | | |
| <i>sort-by</i> | text | The value by which to sort. [<i>Example</i> : To get the city with the highest sales, set-expression would be a set of cities, and sort-by would be the sales measure. To get the city with the highest population, set-expression would be a set of cities, and sort-by would be the population measure. <i>end example</i>] | | | |

Return Type and Value: any – The set of members or tuples.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.
- *sort-order* is outside the range 0–6, #N/A is returned.
- *sort-order* requires *sort-by*, but *sort-by* is omitted, #VALUE! is returned.

[*Example*:

```
CUBESET("Finance", "Order([Product].[Product].[Product Category]
.Members, [Measures].[Unit Sales], ASC)", "Products")
```

```
CUBESET("Sales", "[Product].[All Products].Children",
"Products", 1, "[Measures].[Sales Amount]")
end example
```

18.17.7.70 CUBESETCOUNT

Syntax:

CUBESETCOUNT (*set*)

Description: Computes the number of items in a set.

Arguments:

| Name | Type | Description |
|------------|------|--|
| <i>set</i> | text | An expression that evaluates to a set defined by the CUBESET function. |

Return Type and Value: number – The number of items in a set.

[Example:

CUBESETCOUNT(A3)

CUBESETCOUNT(CUBESET("Sales","[Product].[All Products].Children",
"Products",1,"[Measures].[Sales Amount]"))

end example]

18.17.7.71 CUBEVALUE

Syntax:

CUBEVALUE (*connection* , *argument-list*)

Description: Fetches from the OLAP cube on the OLAP server designated by *connection*, the aggregated value defined by a series of member-expression *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|-----------------|---|
| <i>connection</i> | text | The name of the connection to the cube. |
| <i>argument-list</i> | text, reference | Each <i>argument</i> in <i>argument-list</i> is text containing a multidimensional expression (MDX) that evaluates to a member or tuple within the cube. Alternatively, an <i>argument</i> can be a set defined with the CUBESET function. Use any <i>argument</i> as a slicer to define the portion of the cube for which the aggregated value is returned. If no measure is specified in an <i>argument</i> , the default measure for that cube is used. If a cell reference is used for an <i>argument</i> , and that cell reference contains a CUBE function, then that <i>argument</i> uses the MDX expression for the item in the referenced cell, and not the value displayed in that referenced cell. [Note: MDX is a standard query language for OLAP cubes. end note] |

Return Type and Value: any – The aggregated value.

However, if

- The connection name is not a workbook connection stored in the workbook, the return value is unspecified.
- The OLAP server is not running, not available, or returns an error message, the return value is unspecified.
- At least one element within the tuple is invalid, the return value is unspecified.
- The syntax of *member-expression* is incorrect, the return value is unspecified.
- The member specified by an *argument* doesn't exist in the cube, the return value is unspecified.
- The tuple is invalid because there is no intersection for the specified values, the return value is unspecified. (This can occur with multiple elements from the same hierarchy.)
- The set contains at least one member with a different dimension than the other members, the return value is unspecified.

[Example:

```
CUBEVALUE("Sales", "[Measures].[Profit]", "[Time].[2004]",
  "[All Product].[Beverages]")
CUBEVALUE($A$1, "[Measures].[Profit]", D$12, $A23)
CUBEVALUE("Sales", $B$7, D$12, $A23)
```

end example]

18.17.7.72 CUMIPMT

Syntax:

CUMIPMT (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative interest paid on a loan between *start-period* and *end-period*.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>rate</i> | number | The interest rate. |
| <i>nper</i> | number | The total number of payment periods, truncated to integer. |
| <i>pv</i> | number | The present value. |
| <i>start-period</i> | number | The first period in the calculation. (Payment periods are numbered beginning with 1.) |
| <i>end-period</i> | number | The last period in the calculation. |
| <i>type</i> | number | The timing of the payment, truncated to integer, as |

| Name | Type | Description | | | | | | |
|-------|--|---|-------|--------|---|----------------------------------|---|--|
| | | <div>follows:</div> <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative interest paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0 , #NUM! is returned.
- *start-period* < 1 or *end-period* < 1 , or *start-period* $> end_period$, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMIPMT(0.09/12, 30*12, 125000, 13, 24, 0) results in -11135.23

CUMIPMT(0.09/12, 30*12, 125000, 1, 1, 0) results in -937.50

end example]

18.17.7.73 CUMPRINC

Syntax:

CUMPRINC (*rate* , *nper* , *pv* , *start-period* , *end-period* , *type*)

Description: Computes the cumulative principal paid on a loan between *start-period* and *end-period*.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>rate</i> | number | The interest rate. |
| <i>nper</i> | number | The total number of payment periods, truncated to integer. |
| <i>pv</i> | number | The present value. |
| <i>start-period</i> | number | The first period in the calculation. (Payment periods are numbered beginning with 1.) |
| <i>end-period</i> | number | The last period in the calculation. |

| Name | Type | Description | | | | | | |
|-------------|--|--|-------|--------|---|----------------------------------|---|--|
| <i>type</i> | number | <div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Time information in the date arguments is ignored.

Return Type and Value: number – The cumulative principal paid on a loan.

However, if

- *rate*, *nper*, or *pv* ≤ 0 , #NUM! is returned.
- *start-period* < 1 or *end-period* < 1 , or *start-period* $> end_period$, #NUM! is returned.
- *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

CUMPRINC(0.09/12, 30*12, 125000, 13, 24, 0) results in -934.11

CUMPRINC(0.09/12, 30*12, 125000, 1, 1, 0) results in -68.28

end example]

18.17.7.74 DATE

Syntax:

DATE (*year* , *month* , *day*)

Description: Computes the serial value for the given date.

Arguments:

| Name | Type | Description |
|-------------|--------|---|
| <i>year</i> | number | <p>A positive number, truncated to an integer representing the year, that together with <i>month</i> and <i>day</i> specifies the date whose serial value is to be computed.</p> <p>For the 1900 date base system:</p> <ul style="list-style-type: none"> • If <i>year</i> is in the range 0–99, inclusive, the year shall be interpreted as <i>year</i> + 1900. • If <i>year</i> is in the range -9999–1, inclusive, or 100– |

| Name | Type | Description |
|--------------|--------|--|
| | | <p>9999, inclusive, the year shall be interpreted as <i>year</i>.</p> <p>For the 1900 backward compatibility date-base and 1904 backward compatibility date base systems:</p> <ul style="list-style-type: none"> If <i>year</i> is in the range 0–1899, inclusive, the year shall be interpreted as <i>year</i> + 1900. If <i>year</i> is in the range 1900–9999, inclusive, the year shall be interpreted as <i>year</i>. |
| <i>month</i> | number | <p>A month, truncated to integer, that together with <i>year</i> and <i>day</i> specifies the date whose serial value is to be computed.</p> <p><i>month</i> shall be interpreted as the number of months relative to the final month of the year prior to the specified year.</p> |
| <i>day</i> | number | <p>A day, truncated to integer, that together with <i>month</i> and <i>year</i> specifies the date whose serial value is to be computed.</p> <p><i>day</i> shall be interpreted as the number of days relative to the last day of the month (and its associated year) prior to the month (and its associated year) as determined from <i>month</i> and <i>year</i> (see below).</p> |

The value of *month* or *day* in a *year-month-day* argument triplet can be out of range. *month* is simply an instance of counting a given number of months, minus one, relative to January of the year specified, using the Gregorian calendar [ISO 8601]. This calendar defines that there are 12 months in a year, and that when counting forward, the month following December of one year is January of the following year, and when counting backward, the month preceding January of one year is December of the previous year. Likewise, *day* is simply an instance of counting a given number of days, minus one, relative to the first day of the adjusted month, using the Gregorian calendar. This calendar defines the number of days in each month, and that when counting forward, the day following the final day of one month is the first day of the following month, and when counting backward, the day preceding the first day of one month is the final day of the previous month. [Example: The *year-month-day* argument triplets (2007, 12,32), (2007,13,1), and (2008,1,1) all result in the same serial date. end example]

[Note: One way to handle out-of-range values for *month* or *day* is as follows:

Compute $\text{yearAdjust} = \text{INT}((\text{month} - 1)/12)$

Compute $\text{adjustedMonth} = \text{month} - (\text{yearAdjust} * 12)$

Compute $\text{adjustedYear} = \text{year} + \text{yearAdjust}$.

A *serialDateBase* can now be computed for the first day of the *adjustedYear* and *adjustedMonth*. Finally, compute the serial date for the full triplet by adding (*day*-1) to this *serialDateBase*. end note]

Return Type and Value: number – The serial value for the given date.

However, if *year* is outside the acceptable range for the date base currently in use, #NUM! is returned.

[*Example:* For the 1900 backward compatibility date-base date base system:

DATE(0,1,1) results in a serial value of 1
 DATE(1899,1,1) results in a serial value of 693598
 DATE(1900,1,1) results in a serial value of 1
 DATE(9999,12,31) results in a serial value of 2958465

For the 1904 backward compatibility date-base date base system:

DATE(4,1,1) results in a serial value of 0
 DATE(1899,1,1) results in a serial value of 692136
 DATE(1904,1,1) results in a serial value of 0
 DATE(9999,12,31) results in a serial value of 2957003

end example]

18.17.7.75 DATEDIF

Syntax:

DATEDIF (*start-date* , *end-date* , *unit*)

Description: Calculates the number of days, months, or years between two dates.

Arguments:

| Name | Type | Description | | | | | | | | | | |
|-------------------|--|--|-------|-----------------|-----|---|-----|--|-----|-----------------------------------|------|--|
| <i>start-date</i> | number | The first date in the period, truncated to integer. | | | | | | | | | | |
| <i>end-date</i> | number | The last date in the period, truncated to integer. | | | | | | | | | | |
| <i>unit</i> | text | <div>The count to be returned, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>"Y"</td><td>The number of complete years in the period.</td></tr><tr><td>"M"</td><td>The number of complete months in the period.</td></tr><tr><td>"D"</td><td>The number of days in the period.</td></tr><tr><td>"MD"</td><td>The difference between the days in <i>start-date</i> and <i>end-date</i>. The months and years of</td></tr></table></div> | Value | Day Count Basis | "Y" | The number of complete years in the period. | "M" | The number of complete months in the period. | "D" | The number of days in the period. | "MD" | The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of |
| Value | Day Count Basis | | | | | | | | | | | |
| "Y" | The number of complete years in the period. | | | | | | | | | | | |
| "M" | The number of complete months in the period. | | | | | | | | | | | |
| "D" | The number of days in the period. | | | | | | | | | | | |
| "MD" | The difference between the days in <i>start-date</i> and <i>end-date</i> . The months and years of | | | | | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | the dates are ignored. |
| | | "YM" | The difference between the months in <i>start-date</i> and <i>end-date</i> . The days and years of the dates are ignored. |
| | | "YD" | The difference between the days of <i>start-date</i> and <i>end-date</i> . The years of the dates are ignored. |

Return Type and Value: number – The number of days, months, or years between two dates, depending on the value of *unit*.

However, if

- *start-date* or *end-date* is out of range for the current date base value, #NUM! is returned.
- *start-date* \geq *end-date* #NUM! is returned.
- *unit* is any value other than those shown in the table above, #NUM! is returned.

[Example:

DATEDIF (DATE (2001,1,1),DATE (2003,1,1), "Y") results in 2 complete years

DATEDIF (DATE (2001,6,1),DATE (2002,8,15), "D") results in 440 days

DATEDIF (DATE (2001,6,1),DATE (2002,8,15), "YD") results in 75 days

DATEDIF (DATE (2001,6,1),DATE (2002,8,15), "MD") results in 14 days

end example]

18.17.7.76 DATEVALUE

Syntax:

DATEVALUE (*date-time-string*)

Description: Computes the serial value of the date represented by the string *date-time-string*, taking into account the current date base value.

Arguments:

| Name | Type | Description |
|-------------------------|------|--|
| <i>date-time-string</i> | text | The date and/or time whose date component serial value is to be computed. <i>date-time-string</i> can have any supported date and/or time format. If the year portion of |

| Name | Type | Description |
|------|------|---|
| | | <i>date-time-string</i> is omitted, the current year is used. Any time information in <i>date-time-string</i> shall be ignored. When <i>date-time-string</i> contains both a date and time part, times in <i>date-time-string</i> are truncated. Time-only values for <i>date-time-string</i> are special cased to return 0 so that when they are used in date addition and subtraction, time-only strings are ignored. |

Return Type and Value: number – The serial value of the date represented by the string *date-time-string*.

However, if

- *date-time-string* is out of range for the current date base value, #VALUE! is returned.
- *date-time-string* does not represent a date, #VALUE! is returned.
- *date-time-string* contains only a time, 0 is returned so that when it used in date addition and subtraction, time-only strings are ignored.

[Example: When the current year is 2006,

DATEVALUE("2/1/2006")

DATEVALUE("01-Feb-2006 10:06 AM")

DATEVALUE("2006/2/1")

DATEVALUE("2006-2-1")

DATEVALUE("1-Feb")

all result in 38749 for the 1900 date base system, or 37287 for the 1904 date base system. *end example*]

18.17.7.77 DAVERAGE

Syntax:

DAVERAGE (*database* , *field* , *criteria*)

Description: Averages the values in a column of a list or database that match the specified criteria.

In order to perform an operation on an entire column in a database, a blank line shall be entered below the column labels in the criteria range.

Arguments:

| Name | Type | Description |
|-----------------|-----------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database, which shall be a list of related data in which rows of related information are records, and columns of data are fields. The first row of the list shall contain labels for each |

| Name | Type | Description |
|-----------------|--------------|--|
| | | column. |
| <i>field</i> | text, number | Indicates the column to which <i>criteria</i> shall be applied. It can either be a string containing the column's label, or the column's position number, where columns are numbered starting at 1. [Example: If column 3's label is "Age" then either 3 or "Age" can be used. end example] |
| <i>criteria</i> | reference | <p>The range of cells that contains the specified conditions. Each cell in that range that contains a condition shall have a value that is the form of a number, an expression, a cell reference, or text that defines which cells are selected. In the case of text, <i>criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). A text <i>criteria</i> can also consist of any comparison operator followed by the operand against which each cell's value is to be compared. If the text does not begin with a comparison operator, the criteria matches any string starting with that text, as though the criteria were suffixed by an asterisk (*). [Example: A criteria of "Pea" can result in Pea, Pear, and Peach's being matched, whereas a criteria of "=Pea" only matches Pea. end example]</p> <p>Comparison operators do not require a prefix if used in the string, however it is not possible to specifically search for a string which begins with a comparison operator. The range shall include at least one column label and at least one cell below the column label in which a condition for the column is specified. [Example: If the range G1:G2 contains the column label Income in G1 and the amount 10,000 in G2, one could define the range as MatchIncome and use that name as <i>criteria</i>. end example] The value of <i>criteria</i> shall not overlap the range specified by <i>database</i>.</p> <p>To find rows that meet multiple criteria for a single column, all of the criteria shall be specified directly below one another in separate rows of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, all of the criteria shall be specified in the same row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple criteria for multiple columns, where any criteria can be true, each of the criteria shall be specified in a different row of the <i>criteria</i></p> |

| Name | Type | Description |
|------|------|---|
| | | <p>range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for multiple columns, each set of criteria shall be specified in a separate row of the <i>criteria</i> range.</p> <p>To find rows that meet multiple sets of criteria, where each set includes criteria for one column, multiple columns with the same column heading shall be included in the <i>criteria</i> range.</p> |

Return Type and Value: number – The average of the values of the cells that correspond to the specified criteria.

[*Example:* Given the following data:

| | A | B | C | D | E | F |
|----|--------|--------|-----|-------|--------|--------|
| 1 | Tree | Height | Age | Yield | Profit | Height |
| 2 | =Apple | >10 | | | | <16 |
| 3 | =Pear | | | | | |
| 4 | Tree | Height | Age | Yield | Profit | |
| 5 | Apple | 18 | 20 | 14 | 105.00 | |
| 6 | Pear | 12 | 12 | 10 | 96.00 | |
| 7 | Cherry | 13 | 14 | 9 | 105.00 | |
| 8 | Apple | 14 | 15 | 10 | 75.00 | |
| 9 | Pear | 9 | 8 | 8 | 76.80 | |
| 10 | Apple | 8 | 9 | 6 | 45.00 | |

the average yield of apple trees over 10 feet in height is computed by `DAVERAGE(A4:E10, "Yield", A1:B2)`, which results in 12

The average age of all trees is computed by `DAVERAGE(A4:E10, 3, A4:E10)`, which results in 13

end example]

18.17.7.78 DAY

Syntax:

DAY (*date-value*)

Description: Computes the numeric day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value.

Arguments:

| Name | Type | Description |
|-------------------|--------------|--|
| <i>date-value</i> | number, text | The date and/or time whose day is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored. |

Return Type and Value: number – The day of the month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The returned value shall be in the range 1–31.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

DAY(DATE(2006,1,2)) results in 2

DAY(DATE(2006,0,2)) results in 31

DAY("2006/1/2 10:45 AM") results in 2

DAY(30000) results in 18 for the 1900 date base system, or 19 for the 1904 date base system

end example]

18.17.7.79 DAYS360

Syntax:

DAYS360 (*start-date* , *end-date* [, *method-flag*])

Description: Computes the signed number of days between two dates based on a 360-day year (twelve 30-day months).

Arguments:

| Name | Type | Description | |
|--------------------|---------|---|---------|
| <i>start-date</i> | number | <i>start-date</i> and <i>end-date</i> are the dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> . | |
| <i>start-date</i> | number | | |
| <i>method-flag</i> | logical | Specifies whether to use the U.S. or European method in the calculation, as follows: | |
| | | Value | Meaning |

| Name | Type | Description | |
|------|------|------------------|---|
| | | FALSE or omitted | U.S. (NASD) method: If the <i>start-date</i> is the 31st day of a month, it is changed to the 30th day of that same month. If the <i>end-date</i> is the 31st day of a month and the <i>start-date</i> is earlier than the 30th day of a month, the <i>end-date</i> is changed to the 1st day of the following month; otherwise the <i>end-date</i> is changed to the 30th day of the same month. |
| | | TRUE | European method: <i>start-dates</i> and <i>end-dates</i> that occur on the 31st day of a month are changed to the 30th day of the same month. |

Return Type and Value: number – The signed number of days between two dates based on a 360-day year (12 30-day months). If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the difference in days.

However, if *start-date* or *end-date* is out of range for the current date base value, #NUM! is returned.

[Example:

DAYS360(DATE(2002,2,3),DATE(2005,5,31)) results in 1198

DAYS360(DATE(2005,5,31),DATE(2002,2,3)) results in -1197

DAYS360(DATE(2002,2,3),DATE(2005,5,31),FALSE) results in 1198

DAYS360(DATE(2002,2,3),DATE(2005,5,31),TRUE) results in 1197

|end example]

18.17.7.80 DB

Syntax:

DB (*cost* , *salvage* , *life* , *period* [, [*month*]])

Description: Computes the depreciation of an asset for a specified period using the fixed-declining balance method.

Mathematical Formula:

The fixed-declining balance method computes depreciation at a fixed rate. DB uses the following formulas to calculate depreciation for a period:

$$(cost - total\ depreciation\ from\ prior\ periods) \times rate$$

where:

$$rate = 1 - \left(\frac{salvage}{cost} \right)^{\frac{1}{life}}, \text{ rounded to three decimal places}$$

Depreciation for the first and last periods is a special case. If argument *month* is omitted, depreciation for the first period is calculated using the formula $cost \times rate$.

If month argument is entered, use the following formulas:

For the first period, DB uses this formula:

$$\frac{cost \times rate \times month}{12}$$

For the last period, DB uses this formula:

$$\frac{(cost - total\ depreciation\ from\ prior\ periods) \times rate \times (12 - month)}{12}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *rate* = $1 - (salvage / cost)^{(1 / life)}$, rounded to three decimals
- *salvage* = argument *salvage*
- *total depreciation from prior periods* = DB(*cost*, *salvage*, *life*, 1, [*month*]) + DB(*cost*, *salvage*, *life*, 2, [*month*]) + ... + DB(*cost*, *salvage*, *life*, *period*-1, [*month*]), where *period* > 1

Arguments:

| Name | Type | Description |
|----------------|--------|---|
| <i>cost</i> | number | The initial cost of the asset. |
| <i>salvage</i> | number | The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) |
| <i>life</i> | number | The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.) |

| Name | Type | Description |
|---------------|--------|---|
| <i>period</i> | number | The period for which the depreciation is to be calculated. (<i>period</i> shall use the same units as <i>life</i> .) |
| <i>month</i> | number | The number of months in the first year. If omitted, a value of 12 is used. |

Return Type and Value: number – The depreciation of an asset for a specified period using the fixed-declining balance method.

However, if

- *cost*, *salvage*, *life*, or *period* < 0, #NUM! is returned.
- *month* is outside the range 1–12, #NUM! is returned.

[Example:

DB(1000000,100000,6,1,7) results in 186,083.33

DB(1000000,100000,6,2,7) results in 259,639.42

DB(1000000,100000,6,3,7) results in 176,814.44

DB(1000000,100000,6,4,7) results in 120,410.64

DB(1000000,100000,6,5,7) results in 81,999.64

DB(1000000,100000,6,6,7) results in 55,841.76

DB(1000000,100000,6,7,7) results in 15,845.10

end example]

18.17.7.81 DCOUNT

Syntax:

DCOUNT (*database* , *field* , *criteria*)

Description: Counts the number of values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The count of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Age fields that contain numbers is computed by DCOUNT(A4:E10, "Age", A1:F2), which results in 1.

end example]

18.17.7.82 DCOUNTA

Syntax:

DCOUNTA (*database* , *field* , *criteria*)

Description: Counts the number of non-blank cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.)

Return Type and Value: number – The count of the non-blank cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by DCOUNTA(A4:E10, "Profit", A1:F2), which results in 1.

end example]

18.17.7.83 DDB

Syntax:

DDB (*cost* , *salvage* , *life* , *period* [, *factor*])

Description: Computes the depreciation of an asset for a specified period using the double-declining balance or some other specified method. [*Note:* Use VDB (§18.17.7.341) for a straight-line depreciation method when depreciation is greater than the declining balance calculation. *end note]*

Mathematical Formula:

$$\text{MIN}((\text{cost} - \text{total depreciation from prior periods}) \times \left(\frac{\text{factor}}{\text{life}}\right), (\text{cost} - \text{salvage} - \text{total depreciation from prior periods}))$$

where:

cost = argument *cost*

factor = argument *factor*

life = argument *life*

salvage = argument *salvage*

total depreciation from prior periods = DDB(*cost*, *salvage*, *life*, 1, [*factor*]) + DDB(*cost*, *salvage*, *life*, 2, [*factor*]) + ... + DDB(*cost*, *salvage*, *life*, *period*-1, [*factor*]), where *period* > 1. Depreciation for *period* = 1 can be calculated by using *cost* × *factor*/*life*.

Arguments:

| Name | Type | Description |
|----------------|--------|---|
| <i>cost</i> | number | The initial cost of the asset. |
| <i>salvage</i> | number | The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) |
| <i>life</i> | number | The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.) |
| <i>period</i> | number | The period for which the depreciation is to be calculated. (<i>period</i> shall use the same units as <i>life</i> .) |
| <i>factor</i> | number | The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method). |

Return Type and Value: number – The depreciation of an asset for a specified period.

However, if

- *salvage* < 0 #NUM! is returned.
- *cost* *life* <= 0, #NUM! is returned.
- *life* <= 0 #NUM! is returned.
- *period* <= 0, #NUM! is returned.
- *factor* <= 0, #NUM! is returned.

[Example:

DDB(2400,300,10*365,1) results in 1.32

DDB(2400,300,10*12,1,2) results in 40.00

DDB(2400,300,10,1,2) results in 480.00

DDB(2400,300,10,2,1.5) results in 306.00

DDB(2400,300,10,10) results in 22.12

end example]

18.17.7.84 DEC2BIN

Syntax:

DEC2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

| Name | Type | Description |
|-----------------------|--------|--|
| <i>number</i> | number | The decimal number that is to be converted to a binary string. |
| <i>num-bin-digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer. |

Return Type and Value: text – The binary equivalent of *number* using twos-complement representation with the left-most bit (10th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -512 (1000000000 binary) to 511 (0111111111 binary), inclusive, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2BIN(23) results in 10111

DEC2BIN(-256) results in 1100000000

DEC2BIN(18,7) results in 0010010

end example]

18.17.7.85 DEC2HEX

Syntax:

DEC2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

| Name | Type | Description |
|-----------------------|--------|--|
| <i>number</i> | number | The decimal number that is to be converted to a hexadecimal string. |
| <i>num-hex-digits</i> | number | <i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is truncated to an integer. |

Return Type and Value: text – The hexadecimal equivalent of *number* using twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -549,755,813,888 (8000000000 hex) to 549,755,813,887 (7FFFFFFF hex), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2HEX(23) results in 17

DEC2HEX(-256) results in FFFFFFFF00

DEC2HEX(18,7) results in 0000012

end example]

18.17.7.86 DEC2OCT

Syntax:

DEC2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

| Name | Type | Description |
|-----------------------|--------|---|
| <i>number</i> | number | The decimal number that is to be converted to an octal string. |
| <i>num-bin-digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer. |

Return Type and Value: text – The octal equivalent of *number* using twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit.

However, if

- *number* is outside the range -536,870,912 (4000000000 octal) to 536,870,911 (3777777777 octal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

DEC2OCT(23) results in 27

DEC2OCT(-256) results in 7777777400

DEC2OCT(18,7) results in 0000022

end example]

18.17.7.87 DEGREES

Syntax:

DEGREES (*angle*)

Description: Converts *angle* in radians into degrees.

Arguments:

| Name | Type | Description |
|--------------|--------|---|
| <i>angle</i> | number | The number of radians that is to be converted into degrees. |

Return Type and Value: number – *angle* in degrees.

[Example:

DEGREES(2 * PI()) results in 360

DEGREES(PI()) results in 180

DEGREES(PI()/2) results in 90

DEGREES(8.5) results in 487.0141259

end example]

18.17.7.88 DELTA

Syntax:

DELTA (*number-1* [, *number-2*])

Description: Compares two numbers for equality.

Arguments:

| Name | Type | Description |
|-----------------|--------|--|
| <i>number-1</i> | number | The numbers that are to be compared for equality. If <i>number-2</i> is omitted, it is assumed to be zero. |
| <i>number-2</i> | number | |

Return Type and Value: number – 1 if *number-1* equals *number-2*; otherwise, 0.

[Example:

DELTA(10.5,10.5) results in 1

DELTA(10.5,10.6) results in 0

DELTA(10.5) results in 0

DELTA(0) results in 1

end example]

18.17.7.89 DEVSQ

Syntax:

DEVSQ (*argument-list*)

Description: Computes the sum of squares of deviations of data points from their sample mean.

Mathematical Formula:

$$DEVSQ = \sum (x - \bar{x})^2$$

where:

- x = each element in *argument-list*
- \bar{x} = the mean of the elements in *argument-list*

Arguments:

| Name | Type | Description |
|----------------------|--|--|
| <i>argument-list</i> | logical, number, name, array, or reference to a number. Argument list can be a single argument that is an array or a reference to an array. | The <i>arguments</i> in <i>argument-list</i> designate the values for which the sum of squared deviations is to be calculated. Logical values and text representations of numbers occurring directly in the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The sum of squares of deviations of data points from their sample mean.

[Example:

DEVSQ(5.6,8.2,9.2) results in 6.906666667

DEVSQ({5.6,8.2,9.2}) results in 6.906666667

end example]

18.17.7.90 DGET

Syntax:

DGET (*database* , *field* , *criteria*)

Description: Extracts a single value from a column of a list that matches the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVVERAGE function §18.17.7.77.

Return Type and Value: number – The value of the cell that corresponds to the specified criteria.

However, if

- No record matches the criteria, #VALUE! is returned.
- More than one record matches the criteria, #NUM! is returned.

[Example: Using the data in the example in the DAVVERAGE function §18.17.7.77:

For all the apple trees having a height between 10 and 16, the number of Profit fields that are not blank is computed by DGET(A4:E7,"Yield",A1:A2), which results in 14.

end example]

18.17.7.91 DISC

Syntax:

DISC (*settlement* , *maturity* , *pr* , *redemption* [, [*basis*]])

Description: Computes the discount rate for a security.

Mathematical Formula:

$$DISC = \frac{redemption - par}{par} \times \frac{B}{DSM}$$

where:

- *B* = number of days in a year, depending on the year basis.
- *DSM* = number of days between settlement and maturity.
- *par* = argument *pr*
- *redemption* = argument *redemption*

Arguments:

| Name | Type | Description |
|-------------------|--------|--|
| <i>settlement</i> | number | The security's settlement date. |
| <i>maturity</i> | number | The security's maturity date. |
| <i>pr</i> | number | The security's price per 100 currency units face value. |
| <i>redemption</i> | number | The security's redemption value per 100 currency units face value. |

| Name | Type | Description | | | | | | | | |
|--------------|--|--|--|-----------------|--------------|--|---|--|---|--|
| <i>basis</i> | number | The truncated integer type of day count basis to use, as follows: | | | | | | | | |
| | | <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.</td></tr><tr><td>2</td><td>Actual/360. Similar to Basis 1, but only has</td></tr></table> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. | 2 | Actual/360. Similar to Basis 1, but only has |
| | | Value | Day Count Basis | | | | | | | |
| | | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | | | | | | | |
| 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. | | | | | | | | | |
| 2 | Actual/360. Similar to Basis 1, but only has | | | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

The currency units of *pr* and *redemption* are assumed to be the same currency.

Return Type and Value: number – The discount rate for a security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.

- *settlement* \geq *maturity*, #NUM! is returned.
- *pr* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

DISC(DATE(2007,1,25),DATE(2007,6,15),97.975,100,1) results in 5.2420%

end example]

18.17.7.92 DMAX

Syntax:

DMAX (*database* , *field* , *criteria*)

Description: Computes the maximum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The maximum of the values of the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §18.17.7.77:

The maximum profit of apple and pear trees is computed by DMAX(A4:E10,"Profit",A1:A3), which results in 105.

end example]

18.17.7.93 DMIN

Syntax:

DMIN (*database* , *field* , *criteria*)

Description: Computes the minimum value of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The minimum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The minimum profit of apple trees over 10 in height is computed by DMIN(A4:E10, "Profit", A1:B2), which results in 75.

end example]

18.17.7.94 DOLLAR

Syntax:

DOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The formatting applied to the string for the thousands separator, radix point, and currency symbol are implementation-specific.

Arguments:

| Name | Type | Description |
|--------------------|--------|--|
| <i>number</i> | number | The number that is to be formatted. |
| <i>num-decimal</i> | number | Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed. |

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[*Example:* When the spreadsheet application defines the currency symbol to be "\$", the thousands separator to be ",", and the radix to be ".":

DOLLAR(1234.567) results in \$1,234.57

DOLLAR(1234.567, -2) results in \$1,200

DOLLAR(-1234.567, 4) results in (\$1,234.5670)

When the spreadsheet application defines the currency symbol to be “€”, the thousands separator to be “ ” and the radix to be “,”:

DOLLAR(1234.567) results in 1 234,57 €

DOLLAR(1234.567, -2) results in 1 200 €

DOLLAR(-1234.567, 4) results in -1 234,5670 €

When the spreadsheet application defines the currency symbol to be “SFr.”, the thousands separator to be “'” and the radix to be “.”:

DOLLAR(1234.567) results in SFr. 1'234.57

DOLLAR(1234.567, -2) results in SFr. 1'200

DOLLAR(-1234.567, 4) results in SFr. -1'234.5670

When the spreadsheet application defines the currency symbol to be “kr”, the thousands separator to be “ ” and the radix to be “.”:

DOLLAR(1234.567) results in kr 1 234,57

DOLLAR(1234.567, -2) results in kr 1 200

DOLLAR(-1234.567, 4) results in kr -1 234,5670

end example]

18.17.7.95 DOLLARDE

Syntax:

DOLLARDE (*fractional-dollar* , *fraction*)

Description: Converts a fractional dollar price into a dollar price expressed as a decimal number. [*Note:* Fractional dollar numbers are sometimes used for securities prices. *end note*] The fractional part of *fractional-dollar* is scaled to match the magnitude of *fraction* by moving the decimal place right by the number of digits in *fraction*. The *fractional-dollar* m.n is computed into a decimal dollar value as m + i, where i is an intermediate result equal to (((0.n)*(10^x))/fraction), and x is the base 10 log of fraction, rounded up to the nearest whole number.

[*Example:* Given a *fractional-dollar* value of 1.02 and a *fraction* value of 16, the fractional part of *fractional-dollar* is multiplied by 100, giving a value of 2 to be divided by *fraction* before being added to the integral part of *fractional-dollar*, yielding a decimal price of 1.125. *end example]*

Arguments:

| Name | Type | Description |
|--------------------------|--------|--|
| <i>fractional-dollar</i> | number | The number to be interpreted as a fractional dollar price. |
| <i>fraction</i> | number | The integer to use in the denominator of the fraction. |

Return Type and Value: number – The dollar price expressed as a decimal number.

However, if

- *fraction* < 0, #NUM! is returned.
- *fraction* = 0, #DIV/0! is returned.

[Example:

DOLLARDE(1.02,16) results in 1.125

DOLLARDE(1.1,32) results in 1.3125

end example]

18.17.7.96 DOLLARFR

Syntax:

DOLLARFR (*decimal-dollar* , *fraction*)

Description: Converts a dollar price expressed as a decimal into a dollar price expressed as a fraction. This function is used to convert decimal dollar numbers, such as securities prices, to fractional numbers.

Arguments:

| Name | Type | Description |
|-----------------------|--------|--|
| <i>decimal-dollar</i> | number | The number expressed as a decimal. |
| <i>fraction</i> | number | The integer to use in the denominator of the fraction. |

Return Type and Value: number – The dollar price expressed as a fractional number. [Example: A result of *m.n* means *m* + *n*/*fraction* dollars. end example] The fractional part of the return value is scaled to have the same number of digits after the decimal point, as there are digits in *fraction*. [Example: DOLLARFR(1.125, 16) has a two-digit *fraction* value and so returns the two-digit fractional number 1.02 end example] If an exact numerator cannot be found, the function returns the lowest numerator that could be used with *fraction*, multiplied by a power of ten. [Example: DOLLARFR(1.5,3) returns 1.15, as there is no exact fraction which satisfies $n/3 = 0.5$, and 15/30 represents the lowest power of ten *fraction* can be multiplied by to obtain an exact value. end example]

However, if

- $\text{fraction} < 0$, #NUM! is returned.
- $\text{fraction} = 0$, #DIV/0! is returned.

[Example:

DOLLARFR(1.125,16) results in 1.02

DOLLARFR(1.125,32) results in 1.04

end example]

18.17.7.97 DPRODUCT

Syntax:

DPRODUCT (*database* , *field* , *criteria*)

Description: Computes the product of the values of the cells in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The product of the values of the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §18.17.7.77:

The product of the yields from apple trees with a height greater than 10 is computed by DPRODUCT(A4:E10,"Yield",A1:B2), which results in 140.

end example]

18.17.7.98 DSTDEV

Syntax:

DSTDEV (*database* , *field* , *criteria*)

Description: Estimates the standard deviation of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated standard deviation in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DSTDEV(A4:E10, "Yield", A1:A3), which results in 2.97.

end example]

18.17.7.99 DSTDEVP

Syntax:

DSTDEVP (*database* , *field* , *criteria*)

Description: Computes the standard deviation of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The standard deviation of a population based on the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The true standard deviation in the yield of apple and pear trees if the data in the database is the entire population is computed by DSTDEVP(A4:E10, "Yield", A1:A3), which results in 2.65.

end example]

18.17.7.100 DSUM

Syntax:

DSUM (*database* , *field* , *criteria*)

Description: Computes the sum of the values in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The sum of the values of the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The total profit from apple trees is computed by DSUM(A4:E10, "Profit", A1:A2), which results in 225.

The total profit from apple trees with a height between 10 and 16 is computed by DSUM(A4:E10, "Profit", A1:F2), which results in 75.

end example]

18.17.7.101 DURATION

Syntax:

DURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the Macaulay duration for an assumed par value of 100. Duration is defined as the weighted average term to maturity of the cash flows from a bond. The weight of each cash flow is determined by dividing the present value of the cash flow by the price.

Arguments:

| Name | Type | Description |
|-------------------|--------|---------------------------------|
| <i>settlement</i> | number | The security's settlement date. |

| Name | Type | Description | | | | | | |
|------------------|--|--|-------|-----------------|--------------|--|---|--|
| <i>maturity</i> | number | The security's maturity date. | | | | | | |
| <i>coupon</i> | number | The security's annual coupon rate. | | | | | | |
| <i>yld</i> | number | The security's annual yield. | | | | | | |
| <i>frequency</i> | number | The number of coupon payments per year. For annual payments, frequency is 1; for semiannual payments, frequency is 2; for quarterly payments, frequency is 4. <i>frequency</i> is truncated to an integer. | | | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | 1 | Actual/actual. The actual number of days between the two dates |
| Value | Day Count Basis | | | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | | | | | | | |
| 1 | Actual/actual. The actual number of days between the two dates | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The Macaulay duration for an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *coupon* or *yld* < 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

DURATION(DATE(2008,1,1), DATE(2016,1,1), 0.08, 0.09, 2, 1) results in 5.993774956

end example]

18.17.7.102 DVAR

Syntax:

DVAR (*database* , *field* , *criteria*)

Description: Estimates the variance of a population based on a sample by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – An estimate of the variance of a population based on the cells that correspond to the specified criteria.

[Example: Using the data in the example in the DAVERAGE function §18.17.7.77:

The estimated variance in the yield of apple and pear trees if the data in the database is only a sample of the total orchard population is computed by DVAR(A4:E10, "Yield", A1:A3), which results in 8.8.

end example]

18.17.7.103 DVARP

Syntax:

DVARP (*database* , *field* , *criteria*)

Description: Calculates the variance of a population based on the entire population by using the numbers in a column of a list or database that match the specified criteria. (See the DAVERAGE function §18.17.7.77.)

Arguments:

| Name | Type | Description |
|-----------------|--------------|--|
| <i>database</i> | reference | The range of cells that makes up the list or database. |
| <i>field</i> | text, number | The column to which <i>criteria</i> shall be applied. |
| <i>criteria</i> | reference | The range of cells that contains the specified conditions. |

For a detailed description of each argument, see the DAVERAGE function §18.17.7.77.

Return Type and Value: number – The variance of a population based on the entire population using the cells that correspond to the specified criteria.

[*Example:* Using the data in the example in the DAVERAGE function §18.17.7.77:

The true variance in the yield of apple and pear trees if the data in the database is the entire orchard population is computed by DVARP(A4:E10, "Yield", A1:A3), which results in 7.04.

end example]

18.17.7.104 ECMA.CEILING

Syntax:

ECMA.CEILING (*x* , *significance*)

Description: Computes a value that is *x* rounded-up, away from zero, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>x</i> | number | The value to be rounded |
| <i>significance</i> | number | The multiple to which <i>x</i> is to be rounded. If <i>x</i> is negative, and <i>significance</i> is negative, then the value is rounded down (away from zero). If <i>x</i> is negative, and <i>significance</i> is positive, then the value is |

| Name | Type | Description |
|------|------|---------------------------|
| | | rounded up, towards zero. |

Return Type and Value: number – The rounded-up value of x .

However, if

- x is positive and *significance* is negative, #NUM! is returned.
- x and/or *significance* is zero, zero is returned.

[Example:

ECMA.CEILING(4.3, 2) rounds 4.3 up to nearest multiple of 2; that is, to 6

ECMA.CEILING(4.3, -2) rounds 4.3 up to nearest multiple of -2; that is, to #NUM!

ECMA.CEILING(-4.3, 2) rounds -4.3 up to the nearest multiple of 2; that is, to -4

ECMA.CEILING(-4.3, -2) rounds -4.3 up to the nearest multiple of -2; that is, to -6

end example]

18.17.7.105 EDATE

Syntax:

EDATE (*start-date* , *month-offset*)

Description: Computes the serial value of the date that is *month-offset* months from the date specified by the date *date-string*, taking into account the current date base value.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>start-date</i> | number | The start date. |
| <i>month-offset</i> | number | The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . |

Return Type and Value: number – The serial value of the date that is *month-offset* months from the date specified by the date *date-string*, as a whole number.

However, if

- *start-value* is out of range for the current date base value, #NUM! is returned.
- *start-value* plus *month-offset* is out of range for the current date base value, #NUM! is returned.

[Example: For the 1900 date base system:

EDATE (DATE (2006,1,31),5) results in a serial value of 38898
 EDATE (DATE (2004,2,29),12) results in a serial value of 38411
 EDATE (DATE (2004,2,28),12) results in a serial value of 38411
 EDATE (DATE (2004,1,15),-23) results in a serial value of 37302

For the 1904 date base system:

EDATE (DATE (2006,1,31),5) results in a serial value of 37436
 EDATE (DATE (2004,2,29),12) results in a serial value of 36949
 EDATE (DATE (2004,2,28),12) results in a serial value of 36949
 EDATE (DATE (2004,1,15),-23) results in a serial value of 35840

end example]

18.17.7.106 EFFECT

Syntax:

EFFECT (*nominal-rate* , *npery*)

Description: Computes the effective annual interest rate, given the nominal annual interest rate and the number of compounding periods per year.

Mathematical Formula:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery} \right)^{Npery} - 1$$

where:

- *Nominal_rate* = argument *nominal-rate*
- *Npery* = argument *npery*

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>nominal-rate</i> | number | The nominal interest rate. |
| <i>npery</i> | number | The number of compounding periods per year, truncated to integer. |

Return Type and Value: number – The effective annual interest rate.

However, if

- *nominal-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[Example:

EFFECT(0.0525,4) results in 5.3543%

end example]

18.17.7.107 EOMONTH

Syntax:

EOMONTH (*start-date* , *month-offset*)

Description: Computes the serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, taking into account the current date base value.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>start-date</i> | number | The start date. |
| <i>month-offset</i> | number | The number of months before or after <i>start-date</i> , truncated to integer. A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . |

Return Type and Value: number – The serial value of the last day of the month for the date that is *month-offset* months from the date specified by the date *start-date*, as a whole number.

However, if

- *start-date* is not a date, #NUM! is returned.
- *start-date* plus *month-offset* does not yield a date, #NUM! is returned.

[Example: For the 1900 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 38898

EOMONTH(DATE(2004,2,29),12) results in a serial value of 38411

EOMONTH(DATE(2004,2,28),12) results in a serial value of 38411

EOMONTH(DATE(2004,1,15),-23) results in a serial value of 37315

For the 1904 date base system:

EOMONTH(DATE(2006,1,31),5) results in a serial value of 37436

EOMONTH(DATE(2004,2,29),12) results in a serial value of 36949
 EOMONTH(DATE(2004,2,28),12) results in a serial value of 36949
 EOMONTH(DATE(2004,1,15),-23) results in a serial value of 35853

end example]

18.17.7.108 ERF

Syntax:

ERF (*lower-bound* [, *upper-bound*])

Description: Computes the error function integrated between *lower-bound* and *upper-bound*.

Mathematical Formula:

If *upper-bound* is omitted:

$$ERF(z) = \frac{2}{\sqrt{\pi}} \int_0^z e^{-t^2} dt$$

where:

- z = argument *lower-bound*

If *upper-bound* is present:

$$ERF(a,b) = \frac{2}{\sqrt{\pi}} \int_a^b e^{-t^2} dt = ERF(b) - ERF(a)$$

where:

- b = argument *upper-bound*
- a = argument *lower-bound*

Arguments:

| Name | Type | Description |
|--------------------|--------|---|
| <i>lower-bound</i> | number | The lower bound for integrating ERF. |
| <i>upper-bound</i> | number | The upper bound for integrating ERF. If omitted, the value of the upper bound is <i>lower-bound</i> , and the lower bound becomes zero. |

Return Type and Value: number – The error function integrated between *lower-bound* and *upper-bound*.

However, if

- *lower-bound* is negative, #NUM! is returned.
- *upper-bound* is negative, #NUM! is returned.

[Example:

ERF(1.234,4.5432) results in 0.08096060

ERF(0,1.345) results in 0.94284416

ERF(0,1.345) results in 0.94284416

end example]

18.17.7.109 ERFC

Syntax:

ERFC (*lower-bound*)

Description: Computes the complementary error function integrated between *lower-bound* and ∞ .

Mathematical Formula:

$$ERFC(x) = \frac{2}{\sqrt{\pi}} \int_x^{\infty} e^{-t^2} dt = 1 - ERF(x)$$

where:

- x = argument *lower-bound*

Arguments:

| Name | Type | Description |
|--------------------|--------|---------------------------------------|
| <i>lower-bound</i> | number | The lower bound for integrating ERFC. |

Return Type and Value: number – The complementary error function integrated between *lower-bound* and ∞ .

However, if *lower-bound* is negative

lower-bound or *upper-bound* is negative, #NUM! is returned.

[Example:

ERFC(1.234) results in 0.08096060

ERFC(0) results in 1.00000000

end example]

18.17.7.110 ERROR.TYPE

Syntax:

ERROR.TYPE (*value*)

Description: Determines the kind of the error value designated by *value*.

Arguments:

| Name | Type | Description |
|--------------|------|---|
| <i>value</i> | any | A value whose type is to be determined. No conversion shall take place on the argument passed to this function. |

Return Type and Value: number – The kind of the error value designated by *value*, as follows:

| <i>value</i> | Return Value |
|---------------|--------------|
| #NULL! | 1 |
| #DIV/0! | 2 |
| #VALUE! | 3 |
| #REF! | 4 |
| #NAME? | 5 |
| #NUM! | 6 |
| #N/A | 7 |
| #GETTING_DATA | 8 |
| Anything else | #N/A |

[Example:

ERROR.TYPE(A1) results in 2 if A1 evaluates to #DIV/0!

ERROR.TYPE(A1) results in 4 if A1 evaluates to #REF/0!

ERROR.TYPE(A1) results in 7 if A1 evaluates to #N/A

ERROR.TYPE(A1) results in #N/A if A1 evaluates to a non-error value, such as a number or text

end example]

18.17.7.111 EVEN

Syntax:

EVEN (*x*)

Description: Computes x rounded to the nearest even integer, away from zero. Regardless of the sign of x , a value is rounded up when adjusted away from zero.

Arguments:

| Name | Type | Description |
|------|--------|--------------------------|
| x | number | The value to be rounded. |

Return Type and Value: number – The rounded value of x . If x is zero, the result is zero.

[Example:

EVEN(1.5) rounds 1.5 up to the nearest even integer; that is, to 2.

EVEN(3) rounds 3 up to the nearest even integer; that is, to 4.

EVEN(2) rounds 2 up to the nearest even integer; that is, to 2.

EVEN(-1) rounds -1 up to the nearest even integer; that is, to -2.

end example]

18.17.7.112 EXACT

Syntax:

EXACT (*string-1* , *string-2*)

Description: Performs a case-sensitive, character-by-character, lexical comparison of *string-1* and *string-2*.

Arguments:

| Name | Type | Description |
|-----------------|------|---------------------------------|
| <i>string-1</i> | text | The two strings to be compared. |
| <i>string-2</i> | text | |

Return Type and Value: logical – TRUE if *string-1* and *string-2* have the exact same length and contents; otherwise, FALSE.

[Example:

EXACT("ABC", "ABC") results in TRUE

EXACT("ABC", "ABCD") results in FALSE

EXACT("Abc", "aBC") results in FALSE

EXACT("", "") results in TRUE

end example]

18.17.7.113 EXP

Syntax:

$$\text{EXP} (x)$$

Description: Computes e^x , where the constant e is the base of the natural logarithm.

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The exponent to which e is to be raised. |

Return Type and Value: number – e^x .

However, if x is too large for the result to be representable, #NUM! is returned.

[Example:

EXP(-1) results in 0.367879441

EXP(0) results in 1

EXP(1) results in 2.718281828

EXP(2) results in 7.389056099

end example]

18.17.7.114 EXPONDIST

Syntax:

$$\text{EXPONDIST} (x , \textit{lambda} , \textit{cumulative-flag})$$

Description: Computes the exponential distribution.

Mathematical Formula:

The equation for the probability density function is:

$$f(x, \lambda) = \lambda e^{-\lambda x}$$

The equation for the cumulative distribution function is:

$$F(x, \lambda) = 1 - e^{-\lambda x}$$

where:

- x = argument x
- λ = argument \textit{lambda}

Arguments:

| Name | Type | Description |
|------------------------|---------|---|
| <i>x</i> | number | The value at which the function is evaluated. |
| <i>lambda</i> | number | The inverse of the mean. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, EXPONDIST returns the cumulative distribution function; if FALSE, EXPONDIST returns the probability density function. |

Return Type and Value: number – The exponential distribution.

However, if

- $x < 0$, #NUM! is returned.
- $lambda \leq 0$, #NUM! is returned.

[Example:

EXPONDIST(0.2,10,FALSE) results in 1.353352832

EXPONDIST(2.3,1.5,TRUE) results in 0.968254364

end example]

18.17.7.115 FACT

Syntax:

FACT (*x*)

Description: Computes the factorial of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|--|
| <i>x</i> | number | The non-negative value whose factorial is to be computed. <i>x</i> is truncated to an integer. |

Return Type and Value: number – The factorial of *x*.

However, if

- *x* is negative, #NUM! is returned.
- *x* is too large for the result to be representable, #NUM! is returned.

[Example:

FACT(5) results in 120

FACT(3.5) results in 6

FACT(0) results in 1

end example]

18.17.7.116 FACTDOUBLE

Syntax:

FACTDOUBLE (*n*)

Description: Computes the double factorial of *n*.

Mathematical Formula:

If *n* is even:

$$n!! = n(n-2)(n-4) \dots (4)(2)$$

If *n* is odd:

$$n!! = n(n-2)(n-4) \dots (3)(1)$$

where:

- *n* = argument *n*

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>n</i> | number | The non-negative value whose double factorial is to be computed. <i>n</i> is truncated to an integer. |

Return Type and Value: number – The double factorial of *n*.

However, if

- *n* is negative, #NUM! is returned.
- *n* is too large for the result to be representable, #NUM! is returned.

[Example:

FACTDOUBLE(5) results in 15

FACTDOUBLE (3.5) results in 3

FACTDOUBLE (0) results in 1

end example]

18.17.7.117 FALSE

Syntax:

FALSE ()

Description: Computes the value FALSE. (A call to function FALSE is equivalent to using the *logical-constant* FALSE.)

Arguments: None.

Return Type and Value: logical – The value FALSE.

[Example:

FALSE() results in FALSE

end example]

18.17.7.118 FDIST

Syntax:

FDIST (*x* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the F probability distribution.

Mathematical Formula:

$$FDIST = P(F > x)$$

where:

- *F* is a random variable that has an F distribution with degrees of freedom *degrees-freedom-1* and *degrees-freedom-2*
- *x* is argument *x*

Arguments:

| Name | Type | Description |
|--------------------------|--------|--|
| <i>x</i> | number | The value at which the function is to be evaluated. |
| <i>degrees-freedom-1</i> | number | The number of degrees of freedom for the numerator, truncated to an integer. |

| Name | Type | Description |
|--------------------------|--------|--|
| <i>degrees-freedom-2</i> | number | The number of degrees of freedom for the denominator, truncated to an integer. |

Return Type and Value: number – The F probability distribution.

However, if

- *x* is negative, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* ≥ 10¹⁰, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* ≥ 10¹⁰, #NUM! is returned.

[Example:

FDIST(12.345, 3, 4) results in 0.017226183

end example]

18.17.7.119 FIND

Syntax:

FIND (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (FIND is intended for use with languages that use the single-byte character set (SBCS), whereas FINDB (§18.17.7.120) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|------------------|--------|--|
| <i>string-1</i> | text | Designate the string to be searched for within the string designated by <i>string-2</i> . |
| <i>string-2</i> | text | |
| <i>start-pos</i> | number | The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0. |

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

FIND("de", "abcdef") results in 4

FIND(A10, B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

18.17.7.120 FINDB

Syntax:

FINDB (*string-1* , *string-2* , [*start-pos*])

Description: Performs a case-sensitive search using a lexical comparison for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (FINDB is intended for use with languages that use the double-byte character set (DBCS), whereas FIND (§18.17.7.119) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|------------------|--------|---|
| <i>string-1</i> | text | Designate the string to be searched for within the string designated by <i>string-2</i> . |
| <i>string-2</i> | text | |
| <i>start-pos</i> | number | The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0. |

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

FINDB("de", "abcdef") results in 4

FINDB(A10, B10) results in 4, when A10 contains de, and B10 contains abcdef

end example]

18.17.7.121 FINV

Syntax:

FINV (*probability* , *degrees-freedom-1* , *degrees-freedom-2*)

Description: Computes the inverse of the F probability distribution. Given a value for *probability*, FINV seeks that value x such that $\text{FDIST}(x, \text{degrees-freedom-1}, \text{degrees-freedom-2}) = \text{probability}$. Thus, precision of FINV depends on precision of FDIST.

Arguments:

| Name | Type | Description |
|--------------------------|--------|--|
| <i>probability</i> | number | A probability associated with the F cumulative distribution. |
| <i>degrees-freedom-1</i> | number | The number of degrees of freedom for the numerator, truncated to an integer. |
| <i>degrees-freedom-2</i> | number | The number of degrees of freedom for the denominator, truncated to an integer. |

Return Type and Value: number – The inverse of the F probability distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom-1* < 1 or *degrees-freedom-1* $\geq 10^{10}$, #NUM! is returned.
- *degrees-freedom-2* < 1 or *degrees-freedom-2* $\geq 10^{10}$, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned

[Example:

FINV(0.5,3,4) results in 0.940534076

end example]

18.17.7.122 FISHER

Syntax:

FISHER (x)

Description: Computes the Fisher transformation at x .

Mathematical Formula:

$$z' = \frac{1}{2} \ln \left(\frac{1+x}{1-x} \right)$$

where:

- x = argument x

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The number for which the transformation is wanted. |

Return Type and Value: number – The Fisher transformation at x .

However, if

- $x \leq -1$, #NUM! is returned.
- $x \geq 1$, #NUM! is returned.

[Example:

FISHER(-0.43) results in -0.459896681

FISHER(0.578) results in 0.659454094

end example]

18.17.7.123 FISHERINV

Syntax:

FISHERINV (y)

Description: Computes the inverse of the Fisher transformation.

Mathematical Formula:

$$x = \frac{e^{2y} - 1}{e^{2y} + 1}$$

where:

- y = argument y

Arguments:

| Name | Type | Description |
|------|--------|--|
| y | number | The number for which the inverse of the transformation |

| Name | Type | Description |
|------|------|-------------|
| | | is wanted. |

Return Type and Value: number – The inverse of the Fisher transformation.

[Example:

FISHERINV(-0.43) results in 0.405321309

FISHERINV(0.578) results in 0.521210269

end example]

18.17.7.124 FIXED

Syntax:

FIXED (*number* [, [*num-decimal*] [, *suppress-commas-flag*]])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places, using the same rounding algorithm as ROUND (§18.17.7.278). Thousands separator commas are included as determined by *suppress-commas-flag*.

Arguments:

| Name | Type | Description |
|-----------------------------|---------|---|
| <i>number</i> | number | Designate the number that is to be formatted, truncated to integer. |
| <i>num-decimal</i> | number | Designate the number of decimal places to be used in the resulting string. If negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed. |
| <i>suppress-commas-flag</i> | logical | If TRUE, commas are not included; if FALSE or omitted, commas are included. |

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places.

[Example:

FIXED(1234567) results in 1,234,567.00

FIXED(1234567.555555,4,TRUE) results in 1234567.5556

FIXED(.555555,10) results in 0.5555550000

FIXED(1234567, -3) results in 1,235,000

end example]

18.17.7.125 FLOOR

Syntax:

FLOOR (x , *significance*)

Description: Computes x rounded down, toward zero, to the nearest multiple of *significance*. Regardless of the sign of x , a value is rounded down when adjusted away from zero.

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| x | number | The value to be rounded, |
| <i>significance</i> | number | The multiple to which x is to be rounded. |

Return Type and Value: number – The rounded-down value of x .

However, if x and *significance* have different signs, #NUM! is returned.

[Example:

FLOOR(2.5,1) rounds 2.5 down to nearest multiple of 1; that is, to 2

FLOOR(-2.5,-2) rounds -2.5 down to nearest multiple of -2; that is, to -2

FLOOR(1.5,0.1) rounds 1.5 down to the nearest multiple of 0.1; that is, to 1.5

FLOOR(0.234,0.01) rounds 0.234 down to the nearest multiple of 0.01; that is, to 0.23

end example]

18.17.7.126 FORECAST

Syntax:

FORECAST (x , *known-ys* , *known-xs*)

Description: Calculates, or predicts, a future value by using existing values. The predicted value is a y-value for a given x-value. The known values are existing x-values and y-values, and the new value is predicted by using linear regression.

Mathematical Formula:

FORECAST= $a+bx$, where:

$$a = \bar{y} - b\bar{x}$$

and:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- \bar{x} is the sample mean AVERAGE (known-xs)
- y = a sample value
- \bar{y} is the sample mean AVERAGE (known-ys)

Arguments:

| Name | Type | Description |
|-----------------|------------------|--|
| x | number | The data point for which a value is to be predicted. |
| <i>known-xs</i> | array, reference | The independent data. |
| <i>known-ys</i> | array, reference | The dependent data. |

Return Type and Value: number – The future value.

However, if

- *known-xs* and *known-ys* are empty or contain a different number of data points, the return value is unspecified.
- The variance of *known-xs* equals zero, the return value is unspecified.

[Example:

FORECAST(30,{6,7,9,15,21},{20,28,31,38,40}) results in 10.60725309

end example]

18.17.7.127 FREQUENCY

Syntax:

FREQUENCY (*data-array* , *bins-array*)

Description: Calculates how often values occur within a range of values. A call to FREQUENCY shall be an array formula.

Arguments:

| Name | Type | Description |
|-------------------|-------------------------------|--|
| <i>data-array</i> | array, reference to number | Set of values for which frequencies are to be computed. If <i>data-array</i> contains no values, FREQUENCY returns an |

| Name | Type | Description |
|-------------------|------------------|---|
| | | array of zeros. Cells containing text or that are empty are ignored. |
| <i>bins-array</i> | array, reference | Set of intervals into which the values in <i>data-array</i> are to be grouped. If <i>bins-array</i> contains no values, FREQUENCY returns the number of elements in <i>data-array</i> . |

Return Type and Value: vertical array of numbers – The frequency at which values occur within a range of values. The number of elements in the returned array is one more than the number of elements in *bins-array*. The extra element contains the count of any values above the highest interval.

[Example:

If the cells A2:A10 contain 79, 85, 78, 85, 50, 81, 95, 88, and 97, and the cells B2:B4 contain 70, 79, and 89, FREQUENCY(A2:A10, B2:B4) results in a vertical array containing 1 (50), 2 (79, 78), 4 (85, 85, 81, 88), and 2 (95, 97).

end example]

18.17.7.128 FTEST

Syntax:

FTEST (*array-1* , *array-2*)

Description: Computes the result of an F-test.

Arguments:

| Name | Type | Description |
|----------------|--|--|
| <i>array-1</i> | number, name, array, reference to number | If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>array-2</i> | | |

Return Type and Value: number – The two-tailed probability that the variances in *array-1* and *array-2* are not significantly different.

However, if

- The number of data points in *array-1* or *array-2* is less than 2, the return value is unspecified.
- The variance of *array-1* or *array-2* is zero, the return value is unspecified.

[Example:

If the cells D6:D10 contain 6, 7, 9, 15, and 21, and the cells E6:E10 contain 20, 28, 31, 38, and 40, FTEST(D6:D10, E6:E10) results in 0.648317847

end example]

18.17.7.129 FV

Syntax:

FV (*rate* , *nper* , *pmt* [, [*pv*] [, [*type*]]])

Description: Computes the future value of an investment based on periodic, constant payments and a constant interest rate.

Arguments:

| Name | Type | Description | | | | | | |
|-------------|--|--|-------|--------|---|----------------------------------|---|--|
| <i>rate</i> | number | The interest rate. | | | | | | |
| <i>nper</i> | number | The total number of payment periods, truncated to integer. | | | | | | |
| <i>pmt</i> | number | The payment made each period; it cannot change over the life of the annuity. [<i>Note</i> : Typically, <i>pmt</i> contains principal and interest, but no other fees or taxes. <i>end note</i>] If omitted, <i>pv</i> shall be provided. | | | | | | |
| <i>pv</i> | number | The the present value, or the lump-sum amount that a series of future payments is worth right now. If omitted, it is assumed to be 0, and <i>pmt</i> shall be provided. | | | | | | |
| <i>type</i> | number | <div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The future value of an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

FV(0.06/12,10,-200,-500,1) 2,581.40

FV(0.12/12,12,-1000) results in 12,682.50

FV(0.11/12,35,-2000,,1) results in 82,846.25

FV(0.06/12,12,-100,-1000,1) results in 2,301.40

end example]

18.17.7.130 FVSCHEDULE

Syntax:

FVSCHEDULE (*principal* , *schedule*)

Description: Computes the future value of an initial principal after applying a series of compound interest rates.

[Note: This function can be used to calculate the future value of an investment with a variable or adjustable rate.

end note]

Arguments:

| Name | Type | Description |
|------------------|--------|---|
| <i>principal</i> | number | The present value. |
| <i>schedule</i> | array | Set of interest rates to apply. The values in this array can be numbers or blank cells. Blank cells are taken as zeros (i.e., no interest). |

Return Type and Value: number – The future value of an initial principal after applying a series of compound interest rates.

However, if any element of the array *schedule* is not a number and not blank, #VALUE! is returned.

[Example:

FVSCHEDULE(1,{0.09,0.11,0.1}) results in 1.33089

end example]

18.17.7.131 GAMMADIST

Syntax:

GAMMADIST (*x* , *alpha* , *beta* , *cumulative-flag*)

Description: Computes the gamma distribution.

Mathematical Formula:

The equation for the gamma probability density function is:

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha \Gamma(\alpha)} x^{\alpha-1} e^{-\frac{x}{\beta}}$$

The standard gamma probability density function is:

$$f(x, \alpha) = \frac{x^{\alpha-1} e^{-x}}{\Gamma(\alpha)}$$

When $\alpha = 1$, GAMMADIST returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- α = argument *alpha*
- β = argument *beta*
- x = argument *x*

For a positive integer n , when $\alpha = n/2$, $\beta = 2$, and $\text{cumulative} = \text{TRUE}$, GAMMADIST returns $(1 - \text{CHIDIST}(x))$ with n degrees of freedom.

When α is a positive integer, GAMMADIST is also known as the Erlang distribution.

Arguments:

| Name | Type | Description |
|------------------------|---------|--|
| <i>x</i> | number | The value at which the distribution is to be evaluated. |
| <i>alpha</i> | number | A parameter of the distribution. |
| <i>beta</i> | number | A parameter of the distribution. If $\beta = 1$, GAMMADIST returns the standard gamma distribution. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function. |

Return Type and Value: number – The gamma distribution.

However, if

- $x < 0$, #NUM! is returned.

- $\alpha \leq 0$ or $\beta \leq 0$, #NUM! is returned.

[Example:

GAMMADIST(10,9,2,FALSE) results in 0.03263902

GAMMADIST(10,9,2,TRUE) results in 0.068093631

end example]

18.17.7.132 GAMMAINV

Syntax:

GAMMAINV (*probability* , *alpha* , *beta*)

Description: Computes the inverse of the gamma distribution. Given a value for *probability*, GAMMAINV seeks that value x such that $\text{GAMMADIST}(x, \alpha, \beta, \text{TRUE}) = \text{probability}$. Thus, the precision of GAMMAINV depends on the precision of GAMMADIST.

Arguments:

| Name | Type | Description |
|--------------------|--------|---|
| <i>probability</i> | number | The probability associated with the gamma distribution. |
| <i>alpha</i> | number | A parameter of the distribution. |
| <i>beta</i> | number | A parameter of the distribution. If $\beta = 1$, GAMMAINV returns the standard gamma distribution. |

Return Type and Value: number – The inverse of the gamma distribution.

However, if

- $\text{probability} < 0$ or $\text{probability} > 1$, #NUM! is returned.
- $\alpha \leq 0$ or $\beta \leq 0$, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

GAMMAINV(0.068,9,2) results in 9.997130086

end example]

18.17.7.133 GAMMALN

Syntax:

GAMMALN (x)

Description: Computes the natural logarithm of the gamma function.

Mathematical Formula:

$$\text{GAMMALN} = \text{LN}(\Gamma(x))$$

where:

$$\Gamma(x) = \int_0^{\infty} e^{-u} u^{x-1} du$$

where:

- x = argument x

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The value for which the gamma function is to be calculated. |

Return Type and Value: number – The natural logarithm of the gamma function.

However, if $x \leq 0$, #NUM! is returned.

[Example:

GAMMALN(4.5) results in 2.453736571

end example]

18.17.7.134 GCD

Syntax:

GCD (*argument-list*)

Description: Computes the greatest common divisor of the one or more numbers, designated by *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|---------|--|
| <i>argument-list</i> | numbers | The <i>arguments</i> in <i>argument-list</i> designate the values. Each argument is truncated to an integer. |

Return Type and Value: number – The greatest common divisor of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

GCD(5) results in 5
GCD(5, 2) results in 1
GCD(100, 50, 28) results in 2
GCD(24.5, 36.3) results in 12
GCD(7, 1) results in 1
GCD(5, 0) results in 5

end example]

18.17.7.135 GEOMEAN

Syntax:

GEOMEAN (*argument-list*)

Description: Computes the geometric mean of an array or range of positive data.

Mathematical Formula:

$$GM_{\bar{y}} = \sqrt[n]{y_1 y_2 y_3 \dots y_n}$$

where:

- *n* is the number of elements in *argument-list*.
- $y_1, y_2, y_3, \dots, y_n$ are the values of the *n*-th element in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, array, or reference to number. | The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Logical values and text representations of numbers that entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The geometric mean of an array or range of positive data.

However, if the value of any data point ≤ 0 , #NUM! is returned.

[Example:

GEOMEAN(10.5,5.3,2.9) results in 5.444454702

GEOMEAN(10.5,{5.3,2.9},"12") results in 6.633780588

end example]

18.17.7.136 GESTEP

Syntax:

GESTEP (*number* [, *step*])

Description: Tests if the value of *number* is greater than or equal to that of *step*.

Arguments:

| Name | Type | Description |
|---------------|--------|---|
| <i>number</i> | number | <i>number</i> is the value to test against <i>step</i> . If <i>step</i> is omitted, zero is used. |
| <i>step</i> | number | |

Return Type and Value: number – 1 if *number* \geq *step*; otherwise, 0.

[Example:

GESTEP(5.6,-4.3) results in 1

GESTEP(5.6,5.6) results in 1

GESTEP(-5.6) results in 0

end example]

18.17.7.137 GETPIVOTDATA

Syntax:

GETPIVOTDATA (*data-field* , *pivot-table* , *field-1* , *item-1*
[, *field-2* , *item-2* [, ...]])

Description: Retrieves data stored in a PivotTable report. Calculated fields or items and custom calculations are included in GETPIVOTDATA calculations.

Arguments:

| Name | Type | Description |
|-------------------|------|--|
| <i>data-field</i> | text | The name of the data field that contains the data to be retrieved. |

| Name | Type | Description |
|---------------------------------------|---|--|
| <i>pivot-table</i> | reference to any cell, range of cells, or named range of cells in a PivotTable report | This information is used to determine which PivotTable report contains the data to be retrieved. If <i>pivot-table</i> is a range that includes two or more PivotTable reports, data shall be retrieved from whichever report was created most recently in the range. |
| <i>field-1</i> through <i>field-n</i> | text | Argument pairs <i>field-1</i> and <i>item-1</i> , <i>field-2</i> and <i>item-2</i> through <i>field-n</i> and <i>item-n</i> are field names and item names that describe the data to be retrieved. The pairs can be in any order. Field names and names for items other than dates/times (which shall be expressed as numbers) and numbers shall be enclosed in quotation marks. For OLAP PivotTable reports, items can contain the source name of the dimension as well as the source name of the item. [Example: A field and item pair for an OLAP PivotTable might look like this: "[Product]", "[Product].[All Products].[Foods].[Baked Goods]" end example] If the field and item arguments describe a single cell, the value of that cell is returned regardless of its value. |
| <i>item-1</i> through <i>item-n</i> | text | |

Return Type and Value: any – The data stored in a PivotTable report.

However, if

- *pivot-table* is not a range in which a PivotTable report is found, the return value is unspecified.
- The arguments do not describe a visible field, the return value is unspecified.
- The arguments include a page field that is not displayed, the return value is unspecified.

[Example: Given the following data:

| | A | B | C | D | E |
|----|--------------|-------------|-----------|-----------|-------------|
| 2 | Region | North | | | |
| 3 | | | | | |
| 4 | Sum of Sales | | Product | | |
| 5 | Month | Salesperson | Beverages | Produce | Grand Total |
| 6 | March | Buchanan | \$ 3,522 | \$ 10,201 | \$ 13,723 |
| 7 | | Davolio | \$ 8,725 | \$ 7,889 | \$ 16,614 |
| 8 | March Total | | \$ 12,247 | \$ 18,090 | \$ 30,337 |
| 9 | April | Buchanan | \$ 5,594 | \$ 7,265 | \$ 12,859 |
| 10 | | Davolio | \$ 5,461 | \$ 668 | \$ 6,129 |
| 11 | April Total | | \$ 11,055 | \$ 7,933 | \$ 18,988 |
| 12 | Grand Total | | \$ 23,302 | \$ 26,023 | \$ 49,325 |

GETPIVOTDATA("Sales", \$A\$4) returns the grand total of the Sales field, \$49,325.

GETPIVOTDATA("Sum of Sales", \$A\$4) also returns the grand total of the Sales field, \$49,325; the field name can be entered exactly as it looks on the sheet, or as its root (without "Sum of," "Count of," and so forth).

GETPIVOTDATA("Sales",\$A\$4,"Month","March") returns the grand total for March, \$30,337.

GETPIVOTDATA("Sales",\$A\$4,"Month","March","Product","Produce","Salesperson","Buchanan") returns \$10,201.

GETPIVOTDATA("Sales",\$A\$4,"Region","South") is unspecified because the South region data is not visible.

GETPIVOTDATA("Sales",\$A\$4,"Product","Beverages","Salesperson","Davolio") is unspecified because there is no total value of beverage sales for Davolio.

end example]

18.17.7.138 GROWTH

Syntax:

GROWTH (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes predicted exponential growth by using existing data. GROWTH can also fit an exponential curve to existing x-values and y-values.

Arguments:

| Name | Type | Description |
|-----------------|-------|--|
| <i>known-ys</i> | array | Set of y-values already known in the relationship $y=b*m^x$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable. |
| <i>known-xs</i> | array | Set of x-values that might already be known in the relationship $y=b*m^x$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a <i>known-ys</i> with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> . |
| <i>new-xs</i> | array | A set of new x-values for which GROWTH is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> are omitted, it is assumed to be the array {1,2,3,...} that is the same size as |

| Name | Type | Description |
|-------------------|---------|--|
| | | <i>known-ys</i> . |
| <i>const-flag</i> | logical | Specifies whether to force the constant <i>b</i> to equal 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set equal to 1 and the <i>m</i> -values are adjusted so that $y = m^x$. |

Return Type and Value: array – The y-values for a series of new x-values.

However, if any of the numbers in *known-ys* are zero or negative, #NUM! is returned.

[Example: Given the following data:

| | A | B | C |
|----|-------|---------------------------|-------------------------------|
| 1 | Month | Units | Formula (corresponding units) |
| 2 | 11 | 33,100 | 32618.20377 |
| 3 | 12 | 47,300 | 47729.42261 |
| 4 | 13 | 69,000 | 69841.30086 |
| 5 | 14 | 102,000 | 102197.0734 |
| 6 | 15 | 150,000 | 149542.4867 |
| 7 | 16 | 220,000 | 218821.8762 |
| 8 | Month | Formula (Predicted Units) | |
| 9 | 17 | 320,196.72 | |
| 10 | 18 | 468,536.05 | |

When GROWTH(A2:B4,A6:B8) is an array formula spanning cells C2:C7, those cells take on the results shown. When GROWTH(A2:B4,A6:B8,A9:A10) is an array formula spanning cells B9:B10, those cells take on the results shown.

end example]

18.17.7.139 HARMEAN

Syntax:

HARMEAN (*argument-list*)

Description: Computes the harmonic mean of a data set.

Mathematical Formula:

$$\frac{1}{H_y} = \frac{1}{n} \sum \frac{1}{Y_i}$$

where:

- n = number of elements in *argument-list*
- Y_i = each element in *argument-list*

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, text, number, name, array, or reference to number. | The <i>arguments</i> in <i>argument-list</i> designate the values to be averaged. Argument values can be numbers, or names, arrays, or references that contain numbers. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The harmonic mean of a data set.

However, if the value of any data point ≤ 0 , #NUM! is returned.

[Example:

HARMEAN(4.6,5.8,8.3,7) results in 6.124222

HARMMEAN(10.5,{5.3,2.9},"12") results in 5.617360

end example]

18.17.7.140 HEX2BIN

Syntax:

HEX2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

| Name | Type | Description |
|---------------|------|---|
| <i>number</i> | text | A 10-digit hexadecimal number in a string that is to be converted to a binary string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit. |

| Name | Type | Description |
|-----------------------|--------|---|
| <i>num-bin-digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer. |

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range "FFFFFFE00" (11111111111111111111111111111000000000 binary, -512 decimal) to "1FF" (00000000000000000000000000000000111111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2BIN("fE") results in 11111110

HEX2BIN("FFFFFFFFFE") results in 111111110

HEX2BIN("2") results in 10

HEX2BIN("F",6) results in 001111

end example]

18.17.7.141 HEX2DEC

Syntax:

HEX2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

| Name | Type | Description |
|---------------|--------|---|
| <i>number</i> | string | A 10-digit hexadecimal number in a string that is to be converted to a decimal number. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the |

| Name | Type | Description |
|------|------|--|
| | | left-most bit (40th bit from the right) representing the sign bit. |

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits; that is, *number* is outside the range "8000000000" (-548,755,813,888 decimal) to "7FFFFFFFFF" (548,755,813,887 decimal), inclusive, #NUM! is returned.

[Example:

HEX2DEC("fE") results in 254

HEX2DEC("FFFFFFFFFE") results in -2

HEX2DEC("F000000000") results in -68719476736

end example]

18.17.7.142 HEX2OCT

Syntax:

HEX2OCT (*number* [, *num-oct-digits*])

Description: Makes the octal equivalent of *number*, with the result having *num-oct-digits* digits.

Arguments:

| Name | Type | Description |
|-----------------------|--------|---|
| <i>number</i> | text | A 10-digit hexadecimal number in a string that is to be converted to an octal string. <i>number</i> is not case-sensitive. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (40th bit from the right) representing the sign bit. |
| <i>num-oct-digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-oct-digits</i> is ignored and the result has 10 digits. If <i>num-oct-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-oct-digits</i> is truncated to an integer. |

Return Type and Value: text – The octal equivalent of *number*.

However, if

- *number* is outside the range "FFE0000000" (17774000000000 octal, -536,870,912 decimal) to "1FFFFFFF" (00003777777777 octal, 536,870,911 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-hexadecimal digits, #NUM! is returned.
- *number* contains more than 10 hexadecimal digits, #NUM! is returned.
- *number* needs more digits than *num-oct-digits*, #NUM! is returned.
- *num-oct-digits* is negative or > 10, #NUM! is returned.

[Example:

HEX2OCT("fE") results in 376
 HEX2OCT("FFFFFFFFFE") results in 7777777776
 HEX2OCT("2") results in 2
 HEX2OCT("F",6) results in 000017

end example]

18.17.7.143 HLOOKUP

Syntax:

HLOOKUP (*lookup-value* , *table-array* , *row-index-num* [, [*range-lookup-flag*]])

Description: Performs a horizontal search for a value in the top row of a table or an array, noting the column in which the matching value is found. From that column, the value from a given row is returned.

Arguments:

| Name | Type | Description |
|---------------------|------------------------|--|
| <i>lookup-value</i> | value or reference. | The value to be located in the first row of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character. |
| <i>table-array</i> | array, reference, name | Designates the table of information to be searched. The values in the first row of <i>table-array</i> can be text, numbers, or logical values. If <i>range-lookup-flag</i> is TRUE, the values in the first row of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. If <i>range-lookup-flag</i> is FALSE, <i>table-array</i> 's values need not be sorted. Uppercase and lowercase text |

| Name | Type | Description |
|--------------------------|---------|---|
| | | is treated as equivalent. |
| <i>row-index-num</i> | number | The row number in <i>table-array</i> from which the matching value is to be returned. (A <i>row-index-num</i> of 1 returns the first row value in <i>table-array</i> , a <i>row-index-num</i> of 2 returns the second row value in <i>table-array</i> , and so on.) |
| <i>range-lookup-flag</i> | logical | Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed. |

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *row-index-num* is less than 1, #VALUE! is returned.
- *row-index-num* is greater than the number of rows in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the first row of *table-array*, #N/A is returned.

[Example: Given the following data:

| | A | B | C |
|---|-------|----------|-------|
| 1 | Axles | Bearings | Bolts |
| 2 | 4 | 6 | 9 |
| 3 | 5 | 7 | 10 |
| 4 | 6 | 8 | 11 |

HLOOKUP("Axles",A1:C4,2,TRUE) results in 4

HLOOKUP("Bearings",A1:C4,3,FALSE) results in 7

HLOOKUP("B",A1:C4,3,TRUE) results in 5

HLOOKUP("Bolts",A1:C4,4) results in 11

HLOOKUP(3,{1,2,3;"a","b","c";"d","e","f"},2,TRUE) results in c

end example]

18.17.7.144 HOUR

Syntax:

hour (*time-value*)

Description: Computes the hour for the date and/or time having the given *time-value*.

Arguments:

| Name | Type | Description |
|-------------------|--------|--|
| <i>time-value</i> | number | The date and/or time whose hour is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored. |

Return Type and Value: number – The hour for the date and/or time having the given *time-value*. The returned value shall be in the range 0–23.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[Example:

hour(DATE(2006,2,26)+TIME(2,10,20)) results in 2

hour(TIME(22,56,34)) results in 22

hour(0) results in 0, since serial value 0 represents 00:00:00

hour(10.5) results in 12, since serial value .5 represents 12:00:00

hour("22-Oct-2001 10:53:12") results in 10

hour("10:53:12 pm") results in 22

hour("22:53:12") results in 22

end example]

18.17.7.145 HYPERLINK

Syntax:

HYPERLINK (*link-location* [, [*friendly-name*]])

Description: Creates a shortcut that opens a document stored on a network server, an intranet, or the Internet. When the cell that contains the HYPERLINK function call is clicked, the file stored at *link-location* is opened.

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>link-location</i> | text | The location to be opened as text. <i>link-location</i> can refer to a place in a document—such as a specific cell or named range in a SpreadsheetML worksheet or workbook, or to a bookmark in a WordprocessingML |

| Name | Type | Description |
|----------------------|--------------------|---|
| | | document. The <i>link-location</i> can be to a location on a local hard disk drive, the path to a location on a server or a Uniform Resource Locator (URL) to a location on the Internet or an intranet. [Note: Using a URL is the preferred way of specifying <i>link-location</i> . end note] If the location specified in <i>link-location</i> does not exist or cannot be navigated, an unspecified error is produced when the cell is clicked. <i>link-location</i> can be a string or a reference to a cell containing a string. |
| <i>friendly-name</i> | text, number, name | The value that is displayed in the cell. If omitted, the cell displays <i>link-location</i> . <i>friendly-name</i> can be a value, a text string, a name, or a cell that contains the jump text or value. If the evaluation of <i>friendly-name</i> results in an error value, the cell displays that error value rather than the jump text. |

Return Type and Value: text – The value of *friendly-name*, if it is specified; otherwise, the value of *link-location*.

[Example:

HYPERLINK("http://example.openxmlformats.org/report/budget report.xls", "Click for report"), which opens a worksheet named "budget report.xls" that is stored on the Internet at the location example.openxmlformats.org/report, and displays the text "Click for report".

HYPERLINK("D:\FINANCE\1stqtr.xls", H10), which opens the file 1stqtr.xls that is stored in a directory named Finance on drive D, and displays the numeric value stored in cell H10.

end example]

18.17.7.146 HYPGEOMDIST

Syntax:

HYPGEOMDIST (*sample-successes* , *number-sample* , *population-successes* ,
number-population)

Description: Computes the hypergeometric distribution; that is, the probability of a given number of sample successes, given the sample size, population successes, and population size.

Mathematical Formula:

$$P(X = x) = h(x, n, M, N) = \frac{\binom{M}{x} \binom{N - M}{n - x}}{\binom{N}{n}}$$

where:

- M = *population-successes* argument
- N = *number-population* argument
- x = *sample-successes* argument
- n = *number-sample* argument

Arguments:

| Name | Type | Description |
|-----------------------------|--------|--|
| <i>sample-successes</i> | number | The number of successes in the sample, truncated to integer. |
| <i>number-sample</i> | number | The size of the sample, truncated to integer. |
| <i>population-successes</i> | number | The number of successes in the population, truncated to integer. |
| <i>number-population</i> | number | The population size, truncated to integer. |

Return Type and Value: number – The hypergeometric distribution.

However, if

- *sample-successes* < 0 or *sample-successes* is greater than the lesser of *number-sample* and *population-successes*, #NUM! is returned.
- *sample-successes* is less than the larger of 0 or (*number-sample* - *number-population* + *population-successes*), #NUM! is returned.
- *number-sample* ≤ 0 or *number-sample* > *number-population*, #NUM! is returned.
- *population-successes* ≤ 0 or *population-successes* > *number-population*, #NUM! is returned.
- *number-population* ≤ 0, #NUM! is returned.

[Example:

HYPGEOMDIST(1,4,8,20) results in 0.363261

end example]

18.17.7.147 IF

Syntax:

IF (*logical-value* , [*value-if-true*] [, [*value-if-false*]])

Description: Tests *logical-value*, and if it is TRUE, *value-if-true* is evaluated and returned; otherwise, *value-if-false* is evaluated and returned.

Arguments:

| Name | Type | Description |
|-----------------------|---------|--|
| <i>logical-value</i> | logical | The value to be tested. |
| <i>value-if-true</i> | any | The value returned if <i>logical-value</i> is TRUE. If <i>logical-value</i> is TRUE and <i>value-if-true</i> is omitted, this argument evaluates to 0. <i>value-if-true</i> can contain up to seven levels of nested IF function calls. [Note: <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type. end note] |
| <i>value-if-false</i> | any | The value returned if <i>logical-value</i> is FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> and its preceding comma is omitted, this argument evaluates to FALSE. If <i>logical-value</i> is FALSE and <i>value-if-false</i> is omitted, but its preceding comma is present, this argument evaluates to 0. <i>value-if-false</i> can contain at least seven levels of nested IF function calls. [Note: <i>value-if-true</i> and <i>value-if-false</i> need not evaluate to results of the same type. end note] |

If any argument is an array, every element of that array shall be evaluated when that argument is evaluated.

Return Type and Value: any – *value-if-true*, if *logical-value* is TRUE; otherwise, *value-if-false*.

[Example:

IF(10>5, "Yes", "No") results in Yes

IF(10>5, "Yes") results in Yes

IF(10>5, "Yes",) results in Yes

IF(10<5, "Yes") results in FALSE

IF(10<5, "Yes",) results in 0

IF(10>5, , "No") results in 0

IF(10>5, ,) results in 0

IF(10>5, "Yes", 20) results in Yes

IF(10<5, "Yes", 20) results in 20

end example]

18.17.7.148 IFERROR

Syntax:

IFERROR (*value* , *value-if-error*)

Description: Provides a simpler and more efficient way of trapping and handling errors. It allows the generation of user-defined error text for a function call that can result in an error.

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>value</i> | any | The value that is checked for an error (i.e., any of the following: #N/A, #VALUE!, #REF!, #DIV/0!, #NUM!, #NAME?, or #NULL!). If <i>value</i> is an empty cell, it is treated as an empty string. |
| <i>value-if-error</i> | any | The value to return if <i>value</i> evaluates to an error. If <i>value-if-error</i> is an empty cell, it is treated as an empty string. |

Return Type and Value: any – *value*, if *value* is not an error; otherwise, *value-if-error*. If *value* is an array formula, an array of results for each cell in the range specified in *value*, is returned.

[*Example:* Consider the case in which A3 contains 55, and B3 contains 0:

A3/B3 results in #DIV/0

IFERROR(A3/B3,"Error in calculation") results in Error in calculation

end example]

18.17.7.149 IMABS

Syntax:

IMABS (*complex-number*)

Description: Computes the absolute value of *complex-number*.

Mathematical Formula:

$$IMABS(z) = |z| = \sqrt{x^2 + y^2}$$

where:

- z = argument *complex-number*, expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|--|
| <i>complex-number</i> | text | The complex number for which the absolute value is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: number – The absolute value of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMABS("3+4i") results in 5

IMABS("-2.5-34.6j") results in 34.69020035

end example]

18.17.7.150 IMAGINARY

Syntax:

IMAGINARY (*complex-number*)

Description: Computes the imaginary coefficient of *complex-number*.

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the imaginary coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: number – The imaginary coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMAGINARY("3+4i") results in 4

IMAGINARY("-2.5-34.6j") results in 34.6

end example]

18.17.7.151 IMARGUMENT

Syntax:

IMARGUMENT (*complex-number*)

Description: Computes the argument θ , an angle expressed in radians, such that for a complex number *complex-number* having the form $x+yi$:

$$x + yi = |x + yi| \times e^{i\theta} = |x + yi|(\cos \theta + i \sin \theta)$$

Mathematical Formula:

$$\text{IMARGUMENT}(z) = \tan^{-1}\left(\frac{y}{x}\right) = \theta$$

where:

- $\theta \in (-\pi; \pi]$
- z = argument *complex-number*, expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number in $x + yi$ or $x + yj$ text format. |

Return Type and Value: number – The angle θ , expressed in radians.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMARGUMENT("13+4i") results in 0.298498932

IMARGUMENT("-2.5-5j") results in -2.034443936

end example]

18.17.7.152 IMCONJUGATE

Syntax:

IMCONJUGATE (*complex-number*)

Description: Computes the complex conjugate of the complex number *complex-number*.

Mathematical Formula:

$$\text{ICONJUGATE}(x + yi) = \bar{z} = (x - yi)$$

where:

- \bar{z} = conjugate of the argument *complex-number*, expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the complex conjugate is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the complex conjugate of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCONJUGATE("2.3+4.5i") results in 2.3-4.5i

IMCONJUGATE("-1-4j") results in -1+4j

end example]

18.17.7.153 IMCOS

Syntax:

IMCOS (*complex-number*)

Description: Computes the cosine of the complex number *complex-number*.

Mathematical Formula:

$$\cos(x + yi) = \cos(x) \cosh(y) - \sin(x) \sinh(y)i$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|--|
| <i>complex-number</i> | text | The complex number for which the cosine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the cosine of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMCOS("2.3+4.5i") results in -29.9918288739746-33.5589799796873i
IMCOS("-1-4j") results in 14.7547011704838-22.963673499193j

end example]

18.17.7.154 IMDIV

Syntax:

IMDIV (*complex-number-1* , *complex-number-2*)

Description: Computes the quotient from dividing two complex numbers.

Mathematical Formula:

$$IMDIV(z_1, z_2) = \frac{(a + bi)}{(c + di)} = \frac{(ac + bd) + (bc - ad)i}{c^2 + d^2}$$

where:

- z_1 = argument *complex-number-1* expressed in the form of a + bi
- z_2 = argument *complex-number-2* expressed in the form of c + di

Arguments:

| Name | Type | Description |
|-------------------------|------|---|
| <i>complex-number-1</i> | text | Complex numbers in $x + yi$ or $x + yj$ text format; they designate the dividend and divisor, respectively. |
| <i>complex-number-2</i> | text | |

Return Type and Value: text – A string containing the quotient from *number-1* / *number-2*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMDIV("13+4i", "5+3i") results in 2.26470588235294-0.558823529411765i
IMDIV("-3-3.5i", "5+3i") results in -0.75-0.25i

end example]

18.17.7.155 IMEXP

Syntax:

IMEXP (*complex-number*)

Description: Computes the exponential of the complex number *complex-number*.

Mathematical Formula:

$$\text{IMEXP}(z) = e^{(x+yi)} = e^x e^{yi} = e^x (\cos y + i \sin y)$$

where:

- z = the argument *complex-number*, expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the exponential is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the exponential of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMEXP("2.3+4.5i") results in -2.10251576423113-9.75006374866818i

IMEXP("-1-4j") results in -0.240462049968584+0.278412079051034j

end example]

18.17.7.156 IMLN

Syntax:

IMLN (*complex-number*)

Description: Computes the natural logarithm of *complex-number*.

Mathematical Formula:

$$\ln(x + yi) = \ln \sqrt{x^2 + y^2} + i \tan^{-1} \left(\frac{y}{x} \right)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the natural logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – The natural logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLN("3+4i") results in 1.6094379124341+0.927295218001612i

IMLN("-2.5-34.6j") results in 3.54645723627033-1.64292531532225j

end example]

18.17.7.157 IMLOG10

Syntax:

IMLOG10 (*complex-number*)

Description: Computes the base-10 logarithm of *complex-number*.

Mathematical Formula:

The common logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_{10}(x + yi) = (\log_{10} e) \ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the base-10 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – The base-10 logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLOG10("3+4i") results in 10.698970004336019+0.402719196273373i

IMLOG10("-2.5-34.6j") results in 11.54020680801806-0.713513398623614j

end example]

18.17.7.158 IMLOG2

Syntax:

IMLOG2 (*complex-number*)

Description: Computes the base-2 logarithm of *complex-number*.

Mathematical Formula:

The base-2 logarithm of a complex number can be calculated from the natural logarithm as follows:

$$\log_2(x + yi) = (\log_2 e) \ln(x + yi)$$

where:

- the argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|--|
| <i>complex-number</i> | text | The complex number for which the base-2 logarithm is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – The base-2 logarithm of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMLOG2("3+4i") results in 2.32192809506607+1.33780421255394i

IMLOG2("-2.5-34.6j") results in 5.11645626788577-2.37024020514877j

end example]

18.17.7.159 IMPOWER

Syntax:

IMPOWER (*complex-number* , *y*)

Description: Computes the complex number *complex-number* raised to the power *y*.

Mathematical Formula:

$$(x + yi)^n = r^n e^{in\theta} = r^n \cos \theta + ir^n \sin n$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$= \tan^{-1} \left(\frac{y}{x} \right)$$

and:

$$\theta \in (-\pi; \pi]$$

where:

- argument *complex-number* is expressed in the form *x + yi*
- *n* = argument *y*

Arguments:

| Name | Type | Description |
|-----------------------|--------|---|
| <i>complex-number</i> | text | The complex number in <i>x + yi</i> or <i>x + yj</i> text format. |
| <i>y</i> | number | The exponent to which <i>complex-number</i> is to be raised. |

Return Type and Value: text – A string containing *complex-number^y*, in *x+yi* or *x+yj* text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMPOWER("2.3+4.5i",2.5) results in -52.9752689709953+22.138528463954i
IMPOWER("-1-4j",-3.56) results in 6.34818926783845E-003+1.16156377299512E-003j

end example]

18.17.7.160 IMPRODUCT

Syntax:

IMPRODUCT (*argument-list*)

Description: Multiplies the values of its complex number arguments.

Mathematical Formula:

$$(a + bi)(c + di) = (ac - bd) + (ad + bc)i$$

where:

- Each element of *argument-list* is a complex number expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>argument-list</i> | text | Each <i>argument</i> in <i>argument-list</i> is a complex number string in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the product of the values of its arguments, in $x+yi$ or $x+yj$ text format.

However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

[Example:

IMPRODUCT("13+4i") results in 13+4i

IMPRODUCT("-3-3.5i","5+3i") results in -4.5-26.5i

IMPRODUCT("1.3-2j","-3.4+3j","2.3-6j") results in 67.834+15.13j

end example]

18.17.7.161 IMREAL

Syntax:

IMREAL (*complex-number*)

Description: Computes the real coefficient of *complex-number*.

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|--|
| <i>complex-number</i> | text | The complex number for which the real coefficient is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: number – The real coefficient of *complex-number*.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMREAL("3+4i") results in 3

IMREAL("-2.5-34.6j") results in -2.5

end example]

18.17.7.162 IMSIN

Syntax:

IMSIN (*complex-number*)

Description: Computes the sine of the complex number *complex-number*.

Mathematical Formula:

$$\sin(x + yi) = \sin(x) \cosh(y) - \cos(x) \sinh(y)i$$

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|--|
| <i>complex-number</i> | text | The complex number for which the sine is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the sine of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSIN("2.3+4.5i") results in 33.567264016308-29.9844272159606i

IMSIN("-1-4j") results in -22.9790855778861-14.7448051885587j

end example]

18.17.7.163 IMSQRT

Syntax:

IMSQRT (*complex-number*)

Description: Computes the square root of the complex number *complex-number*.

Mathematical Formula:

$$\sqrt{x + yi} = \sqrt{r} \cos\left(\frac{\theta}{2}\right) + i\sqrt{r} \sin\left(\frac{\theta}{2}\right)$$

where:

$$r = \sqrt{x^2 + y^2}$$

and:

$$\theta = \tan^{-1}\left(\frac{y}{x}\right)$$

and:

$$\theta \in (-\pi; \pi]$$

where:

- argument *complex-number* is expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|-----------------------|------|---|
| <i>complex-number</i> | text | The complex number for which the square root is being computed. <i>complex-number</i> shall be in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – A string containing the square root of *complex-number*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number* is ill-formed, #NUM! is returned.

[Example:

IMSQRT("2.3+4.5i") results in 1.91751290835255+1.17339496918073i

IMSQRT("-1-4j") results in 1.24962106768765-1.60048518044024j

end example]

18.17.7.164 IMSUB

Syntax:

IMSUB (*complex-number-1* , *complex-number-2*)

Description: Computes the difference of two complex numbers.

Mathematical Formula:

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

$$(a + bi) - (c + di) = (a - c) + (b - d)i$$

where:

- argument *complex-number-1* is expressed in the form $a + bi$
- argument *complex-number-2* is expressed in the form $c + di$

Arguments:

| Name | Type | Description |
|-------------------------|------|---|
| <i>complex-number-1</i> | text | Complex numbers in $x + yi$ or $x + yj$ text format; they designate the minuend and subtrahend, respectively. |
| <i>complex-number-2</i> | text | |

Return Type and Value: text – A string containing *number-1 - number-2*, in $x+yi$ or $x+yj$ text format.

However, if *complex-number-1* or *complex-number-2* is ill-formed, #NUM! is returned.

[Example:

IMSUB("13+4i", "5+3i") results in 8+i

IMSUB("-3-3.5i", "5+3i") results in -8-6.5i

end example]

18.17.7.165 IMSUM

Syntax:

IMSUM (*argument-list*)

Description: Adds the values of its arguments.

Mathematical Formula:

$$(a + bi) + (c + di) = (a + c) + (b + d)i$$

where:

- Each element of *argument-list* is a complex number expressed in the form $x + yi$

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>argument-list</i> | text | Each <i>argument</i> in <i>argument-list</i> is a complex number string in $x + yi$ or $x + yj$ text format. |

Return Type and Value: text – The sum of the values of its arguments, in $x+yi$ or $x+yj$ text format.

However, if any *argument* in *argument-list* is ill-formed, #NUM! is returned.

[Example:

IMSUM("3+4i") results in 3+4i

IMSUM("3+4i","5-3i") results in 8+i

end example]

18.17.7.166 INDEX

Syntax:

array form: INDEX (*array* , [*row-number*] [, [*column-number*]])

reference form: INDEX (*reference* [, [*row-number*] [, [*column-number*] [, [*area-number*]]]])

Description: Locates a value or the reference to a value from within a table or range. There are two forms of the INDEX function: the array form and the reference form.

Arguments:

| Name | Type | Description |
|-------------------|------------------|--|
| <i>array</i> | array, reference | Table or range to be searched. If <i>array</i> contains only one row, the corresponding <i>row-number</i> argument is optional. If <i>array</i> contains only one column, the corresponding <i>column-number</i> argument is optional. |
| <i>reference</i> | reference | A reference to one or more cell ranges. If each area (§18.17.2.3) in <i>reference</i> contains only one row, <i>row-number</i> is optional. If each area contains only one column, <i>column-number</i> is optional. |
| <i>row-number</i> | number | <i>row-number</i> indicates the row in <i>array</i> (or <i>reference</i>) from which to return a value (or reference). If <i>row-</i> |
| <i>column-</i> | number | |

| Name | Type | Description |
|--------------------|--------|---|
| <i>number</i> | | <i>number</i> is omitted, <i>column-number</i> shall be present. <i>column-number</i> indicates the column in <i>array</i> (or <i>reference</i>) from which to return a value (or <i>reference</i>). If <i>column-number</i> is omitted, <i>row-number</i> shall be present. If both the <i>row-number</i> and <i>column-number</i> arguments are used, INDEX returns the value (or <i>reference</i>) in the cell at the intersection of <i>row-number</i> and <i>column-number</i> . If <i>array</i> has more than one row and more than one column, and only <i>row-number</i> or <i>column-number</i> is used, INDEX returns an array of the entire row or column in <i>array</i> . If <i>row-number</i> or <i>column-number</i> , but not both, is 0, INDEX returns the array of values for the entire column or row, respectively. In the reference form, if <i>row-number</i> and <i>column-number</i> are both omitted, INDEX returns the area in reference specified by <i>area-number</i> . |
| <i>area-number</i> | number | Indicates a range in <i>reference</i> from which to return the intersection of <i>row-number</i> and <i>column-number</i> . The first area selected or entered is numbered 1, the second 2, and so on. If <i>area-number</i> is omitted, 1 is assumed. [Example: If <i>reference</i> describes the cells (A1:B4, D1:E4, G1:H4), then area-number 1 is the range A1:B4, area-number 2 is the range D1:E4, and area-number 3 is the range G1:H4. end example] |

Return Type and Value: various – For the array form, returns a single value, a whole row, or a whole column from a table or an array, depending on the presence and values of the row and column number indexes.

For the reference form, returns a single reference, a whole row, or a whole column from a reference, depending on the presence and values of the row and column number indexes, and the area number.

However, for the array form

- *row-number* is outside the bounds of *array*, #REF! is returned.
- *column-number* is outside the bounds of *array*, #REF! is returned.

For the reference form

- *row-number* is outside the bounds of *reference*, #REF! is returned.
- *column-number* is outside the bounds of *reference*, #REF! is returned.
- *area-number* is outside the bounds of *reference*, #REF! is returned.

[Example:

INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 2) results in Pears

INDEX({"Apples", "Lemons"; "Bananas", "Pears"}, 2, 1) results in Bananas

INDEX({"Apples", "Lemons"}, , 2) results in Lemons

INDEX({"Apples"; "Bananas"}, 1) results in Apples

Given the following data:

| | A | B | C |
|---|---------|-------|-------|
| 1 | Fruit | Price | Count |
| 2 | Apples | 0.69 | 40 |
| 3 | Bananas | 0.34 | 38 |
| 4 | Lemons | 0.55 | 15 |
| 5 | Oranges | 0.25 | 25 |
| 6 | Pears | 0.59 | 40 |
| 7 | Almonds | 2.8 | 10 |

INDEX(A2:C7, 2, 3) results in 38

INDEX((A2:C4, A6:C7), 2, 2, 2) results in 2.8

INDEX((A2:C4, A6:C7), 2, 2, 1) results in 0.34

end example]

18.17.7.167 INDIRECT

Syntax:

INDIRECT (*ref-text* [, [*A1-ref-style-flag*]])

Description: Locates the reference specified by *ref-text* and evaluates that reference to get to its underlying value. [*Note:* This function should be used when the reference to a cell within a formula is to be changed without changing the formula itself. *end note*]

Arguments:

| Name | Type | Description |
|-----------------|--|--|
| <i>ref-text</i> | An A1-style reference, an R1C1-style reference, a name defined as a reference, or a reference to a cell as a string. | If <i>ref-text</i> refers to another workbook (i.e., it's an external reference), that other workbook shall be open. |

| Name | Type | Description |
|--------------------------|---------|--|
| <i>A1-ref-style-flag</i> | logical | Specifies the kind of reference that is contained in the cell <i>ref-text</i> . If TRUE or omitted, <i>ref-text</i> is interpreted as an A1-style reference (§18.17.2.3.1); otherwise, <i>ref-text</i> is interpreted as an R1C1-style reference (§18.17.2.3.2). |

Return Type and Value: any – The underlying value of the location referred to by *ref-text*.

However, if

- *ref-text* is not a cell reference, #REF! is returned.
- *ref-text* refers to another workbook yet that other workbook is not currently open, the return value is unspecified.
- *ref-text* is a name, then the content of the named expression can have implementation-defined constraints.

[Example:

Given the following data:

| | A | B |
|---|--------|-------|
| 1 | Data | Data |
| 2 | B2 | 1.333 |
| 3 | B3 | 45 |
| 4 | George | 10 |
| 5 | 5 | 62 |

where A2 contains a reference to B2, A3 contains a reference to B3, A4 contains the defined name George that refers to B4, and A5 contains the row number of B5:

INDIRECT(\$A\$2) results in 1.333

INDIRECT(\$A\$3) results in 45

INDIRECT(\$A\$4) results in 10

INDIRECT("B"&\$A\$5) results in 62

INDIRECT("R[-1]C", FALSE) uses the cell in the previous row and current column.

end example]

18.17.7.168 INFO

Syntax:

INFO (category)

Description: Retrieves the operating environment value that corresponds to *category*.

Arguments:

| Name | Type | Description |
|-----------------|------|--|
| <i>category</i> | text | The string designated by <i>category</i> is not case-sensitive. The permitted strings are shown in the table below. |

| <i>category</i> | Meaning | Result Type |
|-----------------|---|-------------|
| "directory" | Path of the current directory or folder. | text |
| "memavail" | Amount of memory available, in bytes. | number |
| "memused" | Amount of memory being used for data. | number |
| "numfile" | Number of active worksheets in the open workbooks. | number |
| "origin" | The absolute cell reference of the top and leftmost cell visible in the window, based on the current scrolling position, prefixed with "\$A: ". [Example: Using cell D9 as an example, the return value would be \$A:\$D\$9. end example] | text |
| "osversion" | Current operating system version. | text |
| "recalc" | Current recalculation mode: "Automatic" or "Manual" | text |
| "release" | Version of the implementation. | text |
| "system" | Name of the operating environment. | text |
| "totmem" | Total memory available, including memory already in use, in bytes. | number |

Return Type and Value: text – The operating environment value that corresponds to *category*.

However, if *category* is not one of the values defined above, #VALUE! is returned.

[Example:

INFO("directory") might result in e:\My Documents\

INFO(A10) might result in e:\My Documents\, where A10 contains directory

INFO("memavail") might result in 1048576

INFO("memused") might result in 1474464

INFO("numfile") might result in 5

INFO("origin") might result in \$A:\$C\$536

INFO("osversion") might result in Windows (32-bit) NT 5.01

INFO("recalc") might result in Automatic

INFO("release") might result in 11.0

INFO("system") might result in pcdos
 INFO("totmem") might result in 2523040

end example]

18.17.7.169 INT

Syntax:

INT (*x*)

Description: Computes *x* rounded down to an integer.

Arguments:

| Name | Type | Description |
|----------|--------|-------------------------------|
| <i>x</i> | number | The value to be rounded down. |

Return Type and Value: number – The rounded-down value of *x*.

[*Example:*

INT(8.9) results in 8
 INT(-8.9) results in -9

end example]

18.17.7.170 INTERCEPT

Syntax:

INTERCEPT (*known-ys* , *known-xs*)

Description: Computes the point at which a line intersects the y-axis by using existing x-values and y-values. The intercept point is based on a best-fit regression line plotted through the known x-values and known y-values.

Mathematical Formula:

The equation for the intercept of the regression line, *a*, is:

$$a = \bar{y} - b\bar{x}$$

where the slope, *b*, is calculated as:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- \bar{x} = the sample mean $AVERAGE(known-xs)$
- y = a sample value
- \bar{y} = the sample mean $AVERAGE(known-ys)$

Arguments:

| Name | Type | Description |
|-----------------|--|---|
| <i>known-ys</i> | number, name, array, reference to number | The dependent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>known-xs</i> | number, name, array, reference to number | The independent set of observations or data. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The point at which a line intersects the y-axis by using existing x-values and y-values.

However, if

- *known-ys* and *known-xs* contain a different number of data points, the return value is unspecified.
- *known-ys* or *known-xs* contain no data points, the return value is unspecified.

[Example:

`INTERCEPT({2,3,9,1,8},{6,5,11,7,5})` results in 0.048387097

end example]

18.17.7.171 INTRATE

Syntax:

`INTRATE (settlement , maturity , investment , redemption [, [basis]])`

Description: Computes the interest rate for a fully invested security.

Mathematical Formula:

$$INTRATE = \frac{\text{redemption} - \text{investment}}{\text{investment}} \times \frac{B}{DIM}$$

where:

- B = number of days in a year, depending on the year basis

- *DIM* = number of days from settlement to maturity.
- *investment* = argument *investment*
- *redemption* = argument *redemption*

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|---|-------|-----------------|--------------|--|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>investment</i> | number | The amount invested in the security. | | | | |
| <i>redemption</i> | number | The amount to be received at maturity.he security's annual yield. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div></td></tr></table></div> | Value | Day Count Basis | 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div> |
| Value | Day Count Basis | | | | | |
| 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div> | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 Februar |

| Name | Type | Description | |
|------|------|-------------|----|
| | | | y. |

Time information in the date arguments is ignored.

Return Type and Value: number – The interest rate for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *investment* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

INTRATE (DATE (2008, 2, 15), DATE (2008, 5, 15), 1000000, 1014420, 2) results in 5.7680%

end example]

18.17.7.172 IPMT

Syntax:

IPMT (*rate* , *per* , *nper* , *pv* , [*fv*] [, [*type*]])

Description: Computes the interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

| Name | Type | Description |
|-------------|--------|---|
| <i>rate</i> | number | The interest rate. |
| <i>per</i> | number | The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> . |
| <i>nper</i> | number | The total number of payment periods in an annuity. |
| <i>pv</i> | number | The present value, or the lump-sum amount that a series of future payments is worth right now. |
| <i>fv</i> | number | The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0). |
| <i>type</i> | number | The timing of the payment, truncated to integer, as follows: |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | |
| | | Value | Timing |
| | | 0 | Payment at the end of the period |
| | | 1 | Payment at the beginning of the period |

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest payment for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

IPMT(0.1/12,1*3,3,8000) results in -22.41

IPMT(0.1,3,3,8000) results in -292.45

end example]

18.17.7.173 IRR

IRR (*values* [, [*guess*]])

Description: Computes the internal rate of return for a series of cash flows represented by the numbers in *values*. (These cash flows do not have to be even, as they would be for an annuity. However, the cash flows shall occur at regular intervals, such as monthly or annually. The internal rate of return is the interest rate received for an investment consisting of payments (negative values) and income (positive values) that occur at regular periods.)

Arguments:

| Name | Type | Description |
|---------------|---------------------------------|---|
| <i>values</i> | array, reference, text, logical | The set of numbers for which the internal rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored. |
| <i>guess</i> | number | An estimate of the result of IRR. If omitted, it is assumed |

| Name | Type | Description |
|------|------|-------------------------------|
| | | to be 0.1 (i.e., 10 percent). |

Return Type and Value: number – The internal rate of return for a series of cash flows.

However, if the implementation determines that a return value cannot be computed, #NUM! is returned.

[Example:

IRR({-70000,12000,15000,18000,21000}) results in -2.1245%

IRR({-70000,12000,15000,18000,21000,26000}) results in 8.6631%

IRR({-70000,12000,15000},-0.1) results in -44.3507%

end example]

18.17.7.174 ISBLANK

Syntax:

ISBLANK (*value*)

Description: Determines if *value* refers to an empty cell.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* refers to an empty cell; otherwise, FALSE.

[Example:

ISBLANK(A10) results in TRUE, when A10 is empty

ISBLANK(A10) results in FALSE, when A10 contains 123

end example]

18.17.7.175 ISERR

Syntax:

ISERR (*value*)

Description: Determines if *value* is any of the error values other than #N/A.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* is one of the error values, excluding #N/A; otherwise, FALSE.

[Example:

ISERR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

ISERR(B1) results in FALSE if B1 evaluates to #N/A

end example]

18.17.7.176 ISERROR

Syntax:

ISERROR (*value*)

Description: Determines if *value* is any of the error values.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* is one of the error values; otherwise, FALSE.

[Example:

ISERROR(A1) results in TRUE if A1 evaluates to #DIV/0!, for example

end example]

18.17.7.177 ISEVEN

Syntax:

ISEVEN (*value*)

Description: Determines if *value* is an even number or refers to a cell containing an even number.

Arguments:

| Name | Type | Description |
|--------------|--------|--|
| <i>value</i> | number | The value to be tested. It is truncated to an integer. |

Return Type and Value: logical – TRUE if *value* is an even number or refers to a cell containing an even number; otherwise, FALSE.

[Example:

ISEVEN(12.456) results in TRUE

ISEVEN(A10) results in FALSE, when A10 contains -15

end example]

18.17.7.178 ISLOGICAL

Syntax:

ISLOGICAL (*value*)

Description: Determines if *value* contains a logical value or refers to a cell containing a logical value.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* contains a logical value or refers to a cell containing a logical value; otherwise, FALSE.

[Example:

ISLOGICAL(TRUE) results in TRUE

ISLOGICAL(A10) results in FALSE, when A10 contains 123

ISLOGICAL({TRUE,2}) results in TRUE

ISLOGICAL({2,TRUE}) results in FALSE

end example]

18.17.7.179 ISNA

Syntax:

ISNA (*value*)

Description: Determines if *value* is the error value #N/A.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* is #N/A; otherwise, FALSE.

[Example:

ISERR(A1) results in TRUE if A1 evaluates to #N/A

ISERR(B1) results in TRUE if B1 evaluates to #DIV/0!, for example

end example]

18.17.7.180 ISNONTTEXT

Syntax:

ISNONTTEXT (*value*)

Description: Determines if *value* does not contain text or does not refer to a cell containing text. An empty cell is not text.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* does not contain text or does not refer to a cell containing text; otherwise, FALSE.

[Example:

ISNONTTEXT("ABC") results in FALSE

ISNONTTEXT(A10) results in TRUE, when A10 contains 123

ISNONTTEXT({1,"ABC"}) results in TRUE

ISNONTTEXT({"ABC",1}) results in FALSE

end example]

18.17.7.181 ISNUMBER

Syntax:ISNUMBER (*value*)**Description:** Determines if *value* contains a number or refers to a cell that contains a number.**Arguments:**

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* contains a number or refers to a cell that contains a number; otherwise, FALSE.

[Example:

ISNUMBER(10.56) results in TRUE

ISNUMBER(A10) results in FALSE, when A10 contains ABC

ISNUMBER({1,"ABC"}) results in TRUE

ISNUMBER({"ABC",1}) results in FALSE

end example]

18.17.7.182 ISO.CEILING

Syntax:ISO.CEILING (*x* , [*significance*])**Description:** Computes a value that is *x* rounded-up, to the nearest multiple of *significance*. Regardless of the sign of *x*, a value is rounded up.**Arguments:**

| Name | Type | Description |
|---------------------|--------|--|
| <i>x</i> | number | The value to be rounded |
| <i>significance</i> | number | <p>The optional multiple to which <i>x</i> is to be rounded.</p> <p>If <i>significance</i> is omitted, its default value is 1.</p> <p>[Note: The absolute value of the multiple is used, so the CEILING function will return the mathematical ceiling irrespective of the signs of <i>x</i> and <i>significance</i>. end note]</p> |

Return Type and Value: number – The rounded-up value of x .

However, if x and/or *significance* is zero, zero is returned.

[Example:

ISO.CEILING(4.3) rounds 4.3 up to nearest multiple of 1; that is, to 5

ISO.CEILING(-4.3) rounds -4.3 up to nearest multiple of 1; that is, to -4

ISO.CEILING(4.3, 2) rounds 4.3 up to the nearest multiple of 2; that is, to 6

ISO.CEILING(4.3, -2) rounds 4.3 up to the nearest multiple of -2; that is, to 6

ISO.CEILING(-4.3, 2) rounds -4.3 up to the nearest multiple of 2; that is, to -4

ISO.CEILING(-4.3, -2) rounds -4.3 up to the nearest multiple of -2; that is, to -4

end example]

18.17.7.183 ISODD

Syntax:

ISODD (*value*)

Description: Determines if *value* is an odd number or refers to a cell containing an odd number.

Arguments:

| Name | Type | Description |
|--------------|--------|--|
| <i>value</i> | number | The value to be tested. It is truncated to an integer. |

Return Type and Value: logical – TRUE if *value* is an odd number or refers to a cell containing an odd number; otherwise, FALSE.

[Example:

ISODD(12.456) results in FALSE

ISODD(A10) results in TRUE, when A10 contains -15

end example]

18.17.7.184 ISPMT

Syntax:

ISPMT (*rate* , *per* , *nper* , *pv*)

Description: Computes the interest paid during a specific period of an investment.

Arguments:

| Name | Type | Description |
|-------------|--------|--|
| <i>rate</i> | number | The interest rate for the investment. |
| <i>per</i> | number | The period for which the interest is to be found, and shall be in the range 1– <i>nper</i> . |
| <i>nper</i> | number | The total number of payment periods for the investment. |
| <i>pv</i> | number | The present value the investment. |

Arguments representing cash paid by investor shall be expressed as negative numbers; arguments representing cash received by the investor shall be expressed as positive numbers.

Return Type and Value: number – The interest paid during a specific period of an investment.

[Example:

ISPMT(0.1/12,1,3*12,8000000) results in -64814.81

ISPMT(0.1,1,3,8000000) results in -533333.33

end example]

18.17.7.185 ISREF

Syntax:

ISREF (*value*)

Description: Determines if *value* is a cell reference.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* is a cell reference; otherwise, FALSE.

[Example:

ISREF("ABC") results in FALSE

ISREF(A10) results in TRUE

end example]

18.17.7.186 ISTE^{TEXT}**Syntax:**ISTEXT (*value*)**Description:** Determines if *value* contains text or refers to a cell containing text.**Arguments:**

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value to be tested. No conversion shall take place on an argument passed to this function. |

Return Type and Value: logical – TRUE if *value* contains text or refers to a cell containing text; otherwise, FALSE.

[Example:

ISTEXT("ABC") results in TRUE

ISTEXT(A10) results in FALSE, when A10 contains 123

ISTEXT({1,"ABC"}) results in FALSE

ISTEXT({"ABC",1}) results in TRUE

end example]

18.17.7.187 JIS

Syntax:JIS (*string*)**Description:** Creates a string that is the conversion of half-width (single-byte) letters within *string* to full-width (double-byte) characters.**Arguments:**

| Name | Type | Description |
|---------------|------|---|
| <i>string</i> | text | Designates the string to be converted. If <i>string</i> does not contain any half-width English letters or katakana, nothing in <i>string</i> is converted. |

Return Type and Value: text – The string resulting from the conversion.

[Example:

JIS("ABC") results in ABC
JIS("エクセル") results in エクセル

end example]

18.17.7.188 KURT

Syntax:

KURT (*argument-list*)

Description: Computes the kurtosis of a data set. Kurtosis characterizes the relative peakedness or flatness of a distribution compared with the normal distribution. Positive kurtosis indicates a relatively peaked distribution. Negative kurtosis indicates a relatively flat distribution.

Mathematical Formula:

Kurtosis is defined as:

$$\left\{ \frac{n(n+1)}{(n-1)(n-2)(n-3)} \sum \left(\frac{x_i - \bar{x}}{s} \right)^4 \right\} - \frac{3(n-1)^2}{(n-2)(n-3)}$$

where:

- n is the number of elements in *argument-list*.
- xj is the value of the j-th element in *argument-list*.
- \bar{x} is the mean of the values in *argument-list*.
- s is the standard deviation of the values in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|--|--|
| <i>argument-list</i> | array reference to an array, number, name, or reference to number. | The <i>arguments</i> in <i>argument-list</i> are the values for which kurtosis is to be calculated. Any <i>argument</i> in <i>argument-list</i> can be an array or a reference to an array. Logical values and text representations of numbers that are directly entered into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The kurtosis of a data set.

However, if

- There are fewer than four data points, the return value is unspecified.
- The standard deviation of the sample equals zero, the return value is unspecified.

[Example:

KURT(10.5,12.4,19.4,23.2) results in -3.644621343

KURT(10.5,{12.4,19.4},23.2) results in -3.644621343

end example]

18.17.7.189 LARGE

Syntax:

LARGE (*array* , *k*)

Description: Computes the k^{th} largest value in a data set.

Arguments:

| Name | Type | Description |
|--------------|------------------|---|
| <i>array</i> | array, reference | The set of numbers from which the k^{th} -largest value is to be determined. |
| <i>k</i> | number | The position (from the largest) in the array or cell range of data to return. |

Return Type and Value: number – The k^{th} largest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$, #NUM! is returned.
- *k* is greater than the number of data points, #NUM! is returned.

[Example:

LARGE({3,5,3,5,4;4,2,4,6,7},3) results in 5

LARGE({3,5,3,5,4;4,2,4,6,7},7) results in 4

end example]

18.17.7.190 LCM

Syntax:

LCM (*argument-list*)

Description: Computes the least common multiple of the one or more *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|--------|---|
| <i>argument-list</i> | number | <i>argument-list</i> specifies the <i>arguments</i> . Each argument is truncated to an integer. |

Return Type and Value: number – The least common multiple of one or more numbers.

However, if any *argument* is negative, #NUM! is returned.

[Example:

LCM(5) results in 5

LCM(5, 2) results in 10

LCM(24.99, 36.45) results in 72

LCM(24, 36, 15) results in 360

end example]

18.17.7.191 LEFT

Syntax:

LEFT (*string* [, *number-chars*])

Description: Extracts the left-most *number-chars* characters from *string*. (LEFT is intended for use with languages that use the single-byte character set (SBCS), whereas LEFTB (§18.17.7.192) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-chars</i> | number | The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing the left-most *number-chars* characters from *string*.

However, if *number-chars* is negative, #VALUE! is returned.

[Example:

LEFT("abcdef", 2) results in ab

LEFT(A10,4) results in xyz1, when A10 contains xyz123

end example]

18.17.7.192 LEFTB

Syntax:

LEFTB (*string* [, *number-bytes*])

Description: Extracts the left-most *number-bytes*-worth of characters from *string*. (LEFTB is intended for use with languages that use the double-byte character set (DBCS), whereas LEFT (§18.17.7.192) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-bytes</i> | number | The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing the left-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* is negative, #VALUE! is returned.

[*Example:* Assuming 1-byte characters:

LEFTB("abcdef",2) results in ab

LEFTB(A10,4) results in xyz1, when A10 contains xyz123

end example]

18.17.7.193 LEN

Syntax:

LEN (*string*)

Description: Determines the number of characters in *string*. (LEN is intended for use with languages that use the single-byte character set (SBCS), whereas LENB (§18.17.7.194) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|---------------|------|--|
| <i>string</i> | text | Designates the string whose length is to be found. |

Return Type and Value: number – The number of characters in *string*.

[Example:

LEN("abc") results in 3

LEN(A10) results in 3, when A1 contains abc

end example]

18.17.7.194 LENB

Syntax:

LENB (*string*)

Description: Determines the number of bytes in *string*. (LENB is intended for use with languages that use the double-byte character set (DBCS), whereas LEN (§18.17.7.193) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|---------------|------|--|
| <i>string</i> | text | Designates the string whose length is to be found. |

Return Type and Value: number – The number of bytes in *string*.

[Example: Assuming 1-byte characters:

LENB("abc") results in 3

LENB(A10) results in 3, when A1 contains abc

end example]

18.17.7.195 LINEST

Syntax:

LINEST (*known-ys* [, [*known-xs*] [, [*const-flag*] [, *stats-flag*]])

Description: Calculates the statistics for a line by using the "least squares" method to calculate a straight line that best fits the data, and returns an array that describes the line.

Mathematical Formula:

The equation for the line is:

$$y = mx + b$$

or

...

$$y = m_1x_1 + m_2x_2 + \dots + b \text{ (if there are multiple ranges of x-values)}$$

where the dependent y-value is a function of the independent x-values. The m-values are coefficients corresponding to each x-value, and b is a constant value. y, x, and m can be vectors.

When there is only one independent x-variable, the slope and y-intercept values can be obtained directly by using the following formulas:

Slope: `INDEX(LINEST(known-ys,known-xs),1)`

Y-intercept: `INDEX(LINEST(known-ys,known-xs),2)`

The accuracy of the line calculated by LINEST depends on the degree of scatter in the data. The more linear the data, the more accurate the LINEST model. LINEST uses the method of least squares for determining the best fit for the data. When there is only one independent x-variable, the calculations for m and b are based on the following formulas:

$$m = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

$$b = \bar{y} - m\bar{x}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(known-xs)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(known-ys)`

Arguments:

| Name | Type | Description |
|-----------------|-------|--|
| <i>known-ys</i> | array | The set of y-values already known in the relationship $y=mx+b$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate |

| Name | Type | Description |
|-------------------|---------|---|
| | | variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable. |
| <i>known-xs</i> | array | An optional set of x-values that might already be known in the relationship $y=mx+b$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> . |
| <i>const-flag</i> | logical | Specifies whether to force the constant <i>b</i> to be zero. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set to zero, and the m-values are adjusted to fit $y=mx$. |
| <i>stats-flag</i> | logical | Specifies whether to return additional regression statistics. If TRUE, LINEST returns the additional regression statistics (see table below), so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, ssresid}. If FALSE or omitted, LINEST returns only the m-coefficients and the constant b. |

The additional regression statistics are as follows:

| Statistic | Description |
|--------------------|---|
| se1, se2, ..., sen | The standard error values for the coefficients m1, m2, ..., mn. |
| seb | The standard error value for the constant b. |
| r2 | The coefficient of determination. |
| sey | The standard error for the y estimate. |
| F | The F statistic, or the F-observed value. |
| df | The degrees of freedom. |
| ssreg | The regression sum of squares. |
| ssresid | The residual sum of squares. |

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The following illustration shows the order in which the additional regression statistics are returned.

[Example:

LINEST({1,9,5,7},{0,4,2,3},,FALSE) results in a slope of 2 and a y-intercept of 1

end example]

18.17.7.196 LN

Syntax:

LN (*x*)

Description: Computes the natural logarithm of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>x</i> | number | The positive real number for which the natural logarithm is being computed. |

Return Type and Value: number – The natural logarithm of *x*.

However, if *x* is zero or negative, #NUM! is returned.

[*Example:*

LN(86) results in 4.454347296

LN(2.7182818) results in 0.999999999

LN(EXP(3)) results in 3

end example]

18.17.7.197 LOG

Syntax:

LOG (*x* [, *base*])

Description: Computes the logarithm of *x* to the base *base*.

Arguments:

| Name | Type | Description |
|-------------|--------|---|
| <i>x</i> | number | The positive real number for which the logarithm is being computed. |
| <i>base</i> | number | The base of the logarithm. If omitted, base 10 is assumed. |

Return Type and Value: number – The logarithm of *x*.

However, if

- x is zero or negative, #NUM! is returned.
- $base$ is zero or negative, #NUM! is returned.

[Example:

LOG(10) results in 1

LOG(8, 2) results in 3

LOG(86, 2.7182818) results in 4.454347343

end example]

18.17.7.198 LOG10

Syntax:

LOG10 (x)

Description: Computes the base-10 logarithm of x .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The positive real number for which the logarithm is being computed. |

Return Type and Value: number – The base-10 logarithm of x .

However, if x is zero or negative, #NUM! is returned.

[Example:

LOG10(86) results in 1.934498451

LOG10(10) results in 1

LOG10(1E5) results in 5

LOG10(10^5) results in 5

end example]

18.17.7.199 LOGEST

Syntax:

LOGEST ($known-ys$ [, [$known-xs$] [, [$const-flag$] [, $stats-flag$]])

Description: Calculates an exponential curve that fits the data, and returns an array of values that describes the curve.

Mathematical Formula:

The equation for the curve is:

$$y = b \times m^x$$

or

$$y = b \times m_1^{x_1} \times m_2^{x_2} \dots \text{(if there are multiple x-values)}$$

where the dependent y-value is a function of the independent x-values. The m-values are bases corresponding to each exponent x-value, and b is a constant value. [Note: y, x, and m can be vectors. *end note*]

When there is only one independent x-variable, the y-intercept (b) values can be obtained directly by using the following formula:

Y-intercept (b): `INDEX(LOGEST(known-ys, known-xs), 2)`

Arguments:

| Name | Type | Description |
|-------------------|---------|--|
| <i>known-ys</i> | array | The set of y-values already known in the relationship $y=b*m^x$. If the array <i>known-ys</i> is a single column, then each column of <i>known-xs</i> is interpreted as a separate variable. If the array <i>known-ys</i> is a single row, then each row of <i>known-xs</i> is interpreted as a separate variable. |
| <i>known-xs</i> | array | An optional set of x-values that might already be known in the relationship $y=b*m^x$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector (that is, a range with a height of one row or a width of one column). If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> . |
| <i>const-flag</i> | logical | Specifies whether to force the constant <i>b</i> to be 1. If TRUE or omitted, <i>b</i> is calculated normally. If FALSE, <i>b</i> is set to 1, and the m-values are adjusted to fit $y=m^x$. |
| <i>stats-flag</i> | logical | Specifies whether to return additional regression statistics. If TRUE, LOGEST returns the additional regression statistics, so the returned array is {mn, mn-1, ..., m1, b; sen, sen-1, ..., se1, seb; r2, sey; F, df; ssreg, |

| Name | Type | Description |
|------|------|---|
| | | ssresid}. If FALSE or omitted, LOGEST returns only the m-coefficients and the constant b. |

The additional regression statistics are described in §18.17.7.195.

Return Type and Value: array – The array that describes the line, in the form {mn, mn-1, ..., m1, b}. The order in which the additional regression statistics are returned is described in §18.17.7.195.

[*Example:* Given the following data:

| | A | B |
|---|-------------|-------------|
| 1 | Month | Units |
| 2 | 11 | 33,100 |
| 3 | 12 | 47,300 |
| 4 | 13 | 69,000 |
| 5 | 14 | 102,000 |
| 6 | 15 | 150,000 |
| 7 | 16 | 220,000 |
| 8 | Formula | |
| 9 | 1.463275628 | 495.3047702 |

When LOGEST(B2:B7,A2:A7, TRUE, FALSE) is an array formula spanning cells A9:B9, those cells take on the results shown.

end example]

18.17.7.200 LOGINV

Syntax:

LOGINV (*probability* , *mean* , *standard-dev*)

Description: Calculates the inverse of the lognormal cumulative distribution function of x, where ln(x) is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$\text{LOGINV}(p, \mu, \sigma) = e^{\left[\mu + \sigma \times (\text{NORMSINV}(p))\right]}$$

where:

- p = argument *probability*

- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>probability</i> | number | A probability associated with the lognormal distribution. |
| <i>mean</i> | number | The mean of $\ln(x)$. |
| <i>standard-dev</i> | number | The standard deviation of $\ln(x)$. |

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x .

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *standard-dev* ≤ 0, #NUM! is returned.

[Example:

LOGINV(0.039084, 3.5, 1.2) results in 4.000025219

end example]

18.17.7.201 LOGNORMDIST

Syntax:

LOGNORMDIST (x , *mean* , *standard-dev*)

Description: Calculates the cumulative lognormal distribution of x , where $\ln(x)$ is normally distributed with parameters *mean* and *standard-dev*.

Mathematical Formula:

$$\text{LOGNORMDIST}(x, \mu, \sigma) = \text{NORMSDIST}\left(\frac{\ln(x) - \mu}{\sigma}\right)$$

where:

- x = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>x</i> | number | The value at which to evaluate the function. |
| <i>mean</i> | number | The mean of $\ln(x)$. |
| <i>standard-dev</i> | number | The standard deviation of $\ln(x)$. |

Return Type and Value: number – The inverse of the lognormal cumulative distribution function of x .

However, if

- $x \leq 0$, #NUM! is returned.
- $standard-dev \leq 0$, #NUM! is returned.

[Example:

LOGNORMDIST(4,3.5,1.2) results in 0.039083556

end example]

18.17.7.202 LOOKUP

Syntax:

vector form: LOOKUP (*lookup-value* , *lookup-vector* , *result-vector*)

array form: LOOKUP (*lookup-value* , *array*)

Description: The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

Arguments:

| Name | Type | Description |
|----------------------|--|--|
| <i>lookup-value</i> | number, string, logical, name, reference | The value to search for in <i>lookup-vector</i> (or <i>array</i>). |
| <i>lookup-vector</i> | reference | A range that contains only one row or one column. The values in <i>lookup-vector</i> can be strings, numbers, or logical values. These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If LOOKUP can't find the <i>lookup-value</i> , it matches the largest value in <i>lookup-vector</i> (or <i>array</i>) that is less than or equal to <i>lookup-value</i> . |
| <i>result-vector</i> | reference | A range that contains only one row or column. It shall be |

| Name | Type | Description |
|--------------|-----------------------|--|
| | | the same size as <i>lookup-vector</i> . |
| <i>array</i> | text, number, logical | A range of cells whose values are to be compared with <i>lookup-value</i> . These values shall be placed in "ascending" order, as follows: ..., -2, -1, 0, 1, 2, ..., A-Z, FALSE, TRUE. Upper- and lowercase strings are equivalent. If <i>array</i> covers an area that has more columns than rows, <i>lookup-value</i> is searched for in the first row. If <i>array</i> is square or has more rows than columns, <i>lookup-value</i> is searched for in the first column. |

Return Type and Value: any – The vector form looks in a vector for a value, and returns a value from the same position in a second vector. The array form looks in the first row or column of an array for the specified value and returns a value from the same position in the last row or column of that array.

However, if

- *lookup-value* is smaller than the smallest value in *lookup-vector* (or the first row or column of *array*), the return value is unspecified.
- The size of the range specified by *result-vector* is not the same as that specified by *lookup-vector*, the return value is unspecified.
- The values in *lookup-vector* (or *array*) are not in "ascending" order, the return value is unspecified.

[Example: Given the following data:

| | A | B |
|---|-----------|--------|
| 1 | Frequency | Color |
| 2 | 4.14 | red |
| 3 | 4.19 | orange |
| 4 | 5.17 | yellow |
| 5 | 5.77 | green |
| 6 | 6.39 | blue |

LOOKUP(4.19,A2:A6,B2:B6) results in orange

LOOKUP(5,A2:A6,B2:B6) results in orange

LOOKUP(7.66,A2:A6,B2:B6) results in blue

LOOKUP("C",{"a","b","c","d";1,2,3,4}) results in 3

LOOKUP("bump",{"a",1;"b",2;"c",3}) results in 2

end example]

18.17.7.203 LOWER

Syntax:

LOWER (*string*)

Description: Makes a lowercase version of *string* by doing a character-by-character conversion of *string* to lowercase, except as noted below. [Note: The conversion of characters in *string* is not dependent on position/context of the character within the string, except as noted below. *end note*]

Arguments:

| Name | Type | Description |
|---------------|------|--|
| <i>string</i> | text | Designates the string to be converted. |

Return Type and Value: text – The lowercase version of *string* after doing a character-by-character conversion to lowercase. However, there is one exception; when Σ (U+03A3) is found in a word-final position, it is converted to ς (U+03C2) instead of σ (U+03C3).

[Example:

LOWER("AbCd123#\$\$%^") results in abcd123#\$\$%^
LOWER(A10) results in 234frtqwc\$##, when A10 contains 234FRTqwc\$##

end example]

18.17.7.204 MATCH

Syntax:

MATCH (*lookup-value* , *lookup-array* [, [*match-type*]])

Description: Locates the relative position of an array item that matches a specified value in a specified order. MATCH shall not distinguish between uppercase and lowercase letters when matching strings.

Arguments:

| Name | Type | Description |
|---------------------|--|--|
| <i>lookup-value</i> | number, string, logical, name, reference | The value to search for in <i>lookup-array</i> . If <i>match-type</i> is 0 and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be used in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To locate a question mark or asterisk, precede that character with a |

| Name | Type | Description | | | | | | | | |
|---------------------|--|--|-------|---------|----|--|---|---|--------------|--|
| | | tilde (~). | | | | | | | | |
| <i>lookup-array</i> | array, reference | A contiguous range of cells containing possible lookup values. | | | | | | | | |
| <i>match-type</i> | number | <div>Specifies how <i>lookup-value</i> is matched with values in <i>lookup-array</i>, as follows:</div> <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>-1</td><td>Finds the smallest value that is greater than or equal to <i>lookup-value</i>. The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ...</td></tr><tr><td>0</td><td>Finds the first value that is exactly equal to <i>lookup-value</i>. The values in <i>lookup-array</i> can be in any order.</td></tr><tr><td>1 or omitted</td><td>Finds the largest value that is less than or equal to <i>lookup-value</i>. The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE.</td></tr></table> | Value | Meaning | -1 | Finds the smallest value that is greater than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ... | 0 | Finds the first value that is exactly equal to <i>lookup-value</i> . The values in <i>lookup-array</i> can be in any order. | 1 or omitted | Finds the largest value that is less than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. |
| Value | Meaning | | | | | | | | | |
| -1 | Finds the smallest value that is greater than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "descending" order: TRUE, FALSE, Z–A, ..., 2, 1, 0, -1, -2, ... | | | | | | | | | |
| 0 | Finds the first value that is exactly equal to <i>lookup-value</i> . The values in <i>lookup-array</i> can be in any order. | | | | | | | | | |
| 1 or omitted | Finds the largest value that is less than or equal to <i>lookup-value</i> . The values in <i>lookup-array</i> shall be placed in "ascending" order: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. | | | | | | | | | |

Return Type and Value: number – The relative position of an array item that matches a specified value in a specified order.

However, if

- No match is found, #N/A is returned.
- *match-type*'s value is out-of-bounds, #NUM! is returned.

[Example:

MATCH(39,{25,38,40,41},1) results in 2

MATCH(41,{25,38,40,41},0) results in 4

end example]

18.17.7.205 MAX

Syntax:

MAX (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array. | The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MAXA (§18.17.7.206). <i>end note</i>] If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[Example:

MAX(10.4, -3.5, 12.6) results in 12.6

MAX(10.4, {-3.5, 12.6}) results in 12.6

MAX({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MAX(-10, -12, -15, B3) results in -10

MAXA(-10, -12, -15, B3) results in 0

end example]

18.17.7.206 MAXA

Syntax:

MAXA (*argument-list*)

Description: Computes the largest of a set of numbers.

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, arrays, reference to | The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in |

| Name | Type | Description |
|------|---|--|
| | number. Any <i>argument</i> can be an array or a reference to an array. | the list of arguments are included. Logical values and numbers in strings inside references are also included. [Note: To ignore these, use MAX (§18.17.7.205). <i>end note</i>] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The largest of a set of numbers; however, if the arguments contain no numbers, zero is returned.

[Example:

MAXA(10.4, -3.5, 12.6) results in 12.6

MAXA(10.4, {-3.5, 12.6}) results in 12.6

MAXA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MAX(-10, -12, -15, B3) results in -10

MAXA(-10, -12, -15, B3) results in 0

end example]

18.17.7.207 MDETERM

Syntax:

MDETERM (*array*)

Description: Computes the determinant of the square matrix of numbers designated by *array*. The determinant is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the calculation is not complete. [Example: The determinant of a singular matrix can differ from zero by 1E-16. *end example*]

Arguments:

| Name | Type | Description |
|--------------|------------------|---------------------------------------|
| <i>array</i> | array, reference | Designate a square matrix of numbers. |

Return Type and Value: number – The determinant of *array*. Some square matrices cannot be inverted. The determinant of a non-invertible matrix is 0.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.

- The matrix designated by *array* is not square, #VALUE! is returned.

[Example:

MDETERM(A2:D5) results in the determinant of the 4x4 array designated by the cell range

MDETERM({3,6,1;1,1,0;3,10,2}) results in 1

MDETERM({3,6;1,1}) results in -3

end example]

18.17.7.208 MDURATION

Syntax:

MDURATION (*settlement* , *maturity* , *coupon* , *yld* , *frequency* [, [*basis*]])

Description: Computes the modified Macaulay duration for a security with an assumed par value of 100.

Mathematical Formula:

$$MDURATION = \frac{DURATION}{1 + \left(\frac{Market\ yield}{Coupon\ payments\ per\ yea} \right)}$$

where:

- *Coupon payments per year* = argument *frequency*
- *DURATION* = DURATION(*settlement*, *maturity*, *coupon*, *yld*, *frequency*, [*basis*])
- *Market yield* = argument *yld*

Arguments:

| Name | Type | Description |
|-------------------|--------|---|
| <i>settlement</i> | number | The security's settlement date. |
| <i>maturity</i> | number | The security's maturity date. |
| <i>coupon</i> | number | The security's annual coupon rate. |
| <i>yld</i> | number | The security's annual yield. |
| <i>frequency</i> | number | the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer. |
| <i>basis</i> | number | The truncated integer type of day count basis to use, as follows: <div> <div>Value</div> <div>Day Count Basis</div> </div> |

| Name | Type | Description | |
|------|------|--------------|--|
| | | Ø or omitted | <p>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |

| Name | Type | Description | |
|------|------|-------------|---|
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The modified Macaulay duration for a security with an assumed par value of 100.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *coupon* or *yld* < 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

MDURATION(DATE(2008,1,1),DATE(2016,1,1),0.08,0.09,2,1) results in 5.7357

end example]

18.17.7.209 MEDIAN

Syntax:

MEDIAN (*argument-list*)

Description: Computes the median of the numeric values of its arguments. The median of a set of values is the value for which half the numbers in the set are greater, and half the values are less. For sets with an odd number of values, the median is calculated by finding the value whose rank in the ordered set of all values is equal to half the number of items (n) in the set plus one half (i.e., $n/2 + 1/2$). If the number of values in the set is even, then the median is defined to be the average of the values of rank $n/2$ and $n/2 + 1$.

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, arrays, reference to number. | The <i>arguments</i> in <i>argument-list</i> designate the values whose median is to be computed. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The median of the values of its arguments.

[Example:

MEDIAN(10,20) results in 15

MEDIAN(-3.5,1.4,6.9,-4.5) results in -1.05

MEDIAN({-3.5,1.4,6.9},-4.5) results in -1.05

end example]

18.17.7.210 MID

Syntax:

MID (*string* , *start-pos* , *number-chars*)

Description: Extracts *number-chars* characters from *string*, starting at character position *start-pos*. (MID is intended for use with languages that use the single-byte character set (SBCS), whereas MIDB (§18.17.7.211) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-chars</i> | number | The number of characters to be extracted. <i>number-chars</i> shall be at least 0. |
| <i>start-pos</i> | number | The starting position within <i>string</i> , where the first character is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-chars</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing *number-chars* characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

MID("abcdef", 3, 2) results in cd

MID(A10, 4, 1) results in 1, when A10 contains xyz123

MID("abcdef", 4, 5) results in def

end example]

18.17.7.211 MIDB

Syntax:

MIDB (*string* , *start-pos* , *number-bytes*)

Description: Extracts *number-bytes*-worth of characters from *string*, starting at character position *start-pos*. (MIDB is intended for use with languages that use the double-byte character set (DBCS), whereas MID (§18.17.7.210) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-bytes</i> | number | The number of characters to be extracted. <i>number-bytes</i> shall be at least 0. |
| <i>start-pos</i> | number | The starting position within <i>string</i> , where the first byte is position 1. If <i>start-pos</i> is greater than the length of <i>string</i> , or if <i>start-pos</i> and <i>number-bytes</i> combined exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing *number-bytes*-worth of characters from *string*, starting at character position *start-pos*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

MIDB("abcdef", 3, 2) results in cd

MIDB(A10, 4, 1) results in 1, when A10 contains xyz123

MIDB("abcdef", 4, 5) results in def

end example]

18.17.7.212 MIN

Syntax:

MIN (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array. | The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. However, logical values and numbers in strings and are ignored inside references. [Note: To include these, use MINA (§18.17.7.213). end note] If an array or reference argument contains text, logical values, or empty cells, |

| Name | Type | Description |
|------|------|---|
| | | those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The smallest of a set of numbers; however, if the *arguments* contain no numbers, zero is returned.

[Example:

MIN(10.4, -3.5, 12.6) results in -3.5

MIN(10.4, {-3.5, 12.6}) results in -3.5

MIN({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MIN(10, 12, 15, B3) results in 10

MINA(10, 12, 15, B3) results in 0

end example]

18.17.7.213 MINA

Syntax:

MINA (*argument-list*)

Description: Computes the smallest of a set of numbers.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array. | The <i>arguments</i> in <i>argument-list</i> designate the values for which the largest value is to be computed. Logical values and text representations of numbers occurring directly in the list of arguments are included. Logical values and numbers in strings inside references are also included. [Note: To ignore these, use MIN (§18.17.7.212). end note] If an array or reference argument contains non-numeric text or empty cells, those values are ignored; however, cells with the value 0 are included. |

Any *argument* in *argument-list* can be an array or a reference to an array.

Return Type and Value: number – The smallest of a set of numbers; however, if the *arguments* contain no numbers, zero is returned.

[Example:

MINA(10.4, -3.5, 12.6) results in -3.5

MINA(10.4, {-3.5, 12.6}) results in -3.5

MINA({"ABC", TRUE}) results in 0

Consider the case in which cell B3 contains 0:

MIN(10, 12, 15, B3) results in 10

MINA(10, 12, 15, B3) results in 0

end example]

18.17.7.214 MINUTE

Syntax:

MINUTE (*time-value*)

Description: Computes the minute for the date and/or time having the given *time-value*.

Arguments:

| Name | Type | Description |
|-------------------|--------|--|
| <i>time-value</i> | number | The date and/or time whose minute is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored. |

Return Type and Value: number – The minute for the date and/or time having the given *time-value*. The returned value shall be in the range 0–59.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[Example:

MINUTE (DATE (2006, 2, 26)+TIME (2, 10, 20)) results in 10

MINUTE (TIME (22, 56, 34)) results in 56

MINUTE (0) results in 0, since serial value 0 represents 00:00:00

MINUTE (10.5) results in 0, since serial value .5 represents 12:00:00

MINUTE ("22-Oct-2001 10:53:12") results in 53

MINUTE ("10:53:12 pm") results in 53

MINUTE ("22:53:12") results in 53

end example]

18.17.7.215 MINVERSE

Syntax:MINVERSE (*array*)

Description: Computes the inverse of the square matrix of numbers designated by *array*. The inverse matrix is calculated with an accuracy of at least 15 digits, which can lead to a small numeric error when the cancellation is not complete.

Arguments:

| Name | Type | Description |
|--------------|------------------|---------------------------------------|
| <i>array</i> | array, reference | Designate a square matrix of numbers. |

Return Type and Value: number – The inverse of the square matrix designated by *array*.

However, if

- Any cells in *array* are empty or contain text, the return value is unspecified.
- The matrix designated by *array* is not square, #VALUE! is returned.
- The matrix cannot be inverted, the return value is unspecified.

[Example:

MINVERSE({3,6,1;1,1,0;3,10,2}) results in 2

MINVERSE({3,6;1,1}) results in -0.333333333

end example]

18.17.7.216 MIRR

MIRR (*values* , *finance-rate* , *reinvest-rate*)

Description: Computes the modified internal rate of return for a series of periodic cash flows. (Both the cost of the investment and the interest received on reinvestment of cash are considered.)

Mathematical Formula:

The formula for MIRR is:

$$\left(\frac{-NPV(rrate, values[positive]) * (1 + rrate)^n}{NPV(frater, values[negative]) * (1 + frater)} \right)^{\frac{1}{n-1}} - 1$$

where:

- *frate* = argument *finance-rate*
- *n* = number of cash flows in argument *values*
- *rrate* = argument *reinvest-rate*
- *values* = argument *values*

Arguments:

| Name | Type | Description |
|----------------------|------------------|---|
| <i>values</i> | array, reference | Designates a set of numbers for which the rate of return is to be calculated. <i>values</i> shall contain at least one positive value and one negative value to calculate the internal rate of return. The order of numbers in <i>values</i> is significant, so be sure payment and income numbers are in the desired sequence. If <i>values</i> contains elements that are text, logical values, or empty cells, those elements are ignored. |
| <i>finance-rate</i> | number | The interest rate paid pay on the money used in the cash flows. |
| <i>reinvest-rate</i> | number | The interest rate received on the cash flows as they are reinvested. |

Return Type and Value: number – The modified internal rate of return for a series of periodic cash flows.

However, if *values* does not contain at least one positive value and one negative value, #DIV/0! is returned.

[Example:

MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.12) results in 12.6094%

MIRR({-120000,39000,30000,21000},0.1,0.12) results in -4.8045%

MIRR({-120000,39000,30000,21000,37000,46000},0.1,0.14) results in 13.4759%

end example]

18.17.7.217 MMULT

Syntax:

MMULT (*array-1* , *array-2*)

Description: Computes the product of the matrices of numbers designated by *array-1* and *array-2*.

Mathematical Formula:

The matrix product array *a* of two arrays *b* and *c* is:

$$a_{ij} = \sum_{k=1}^n b_{ik} c_{kj}$$

Where:

- b_{ik} = the element in the i -th row and k -th column in argument *array-1*
- c_{kj} = the element in the k -th row and j -th column in argument *array-2*
- i = the row number
- j = the column number

Arguments:

| Name | Type | Description |
|----------------|---------------------------|---|
| <i>array-1</i> | array, reference, name | Designate the matrices of numbers to be multiplied. |
| <i>array-2</i> | | |

Return Type and Value: number – The product of the matrices of numbers designated by *array-1* and *array-2*.

However, if

- Any cells in *array-1* or *array-2* are empty or contain text, the return value is unspecified.
- The number of columns in *array-1* is different from the number of rows in *array-2*, #VALUE! is returned.

[Example:

MMULT({3,6,1;1,1,0},{5,7;4,6;2,5}) results in 41

end example]

18.17.7.218 MOD

Syntax:

MOD (x , y)

Description: Computes the remainder when x is divided by y . The result has the same sign as y .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The number for which the remainder is being sought. |
| y | number | The number by which x is to be divided. |

Return Type and Value: number – The remainder when x is divided by y . The result has the same sign as y . If y is 0, the return value is unspecified.

[Example:

MOD(3, 2) results in 1

MOD(-3, 2) results in 1

MOD(3, -2) results in -1

MOD(-3, -2) results in -1

end example]

18.17.7.219 MODE

Syntax:

MODE (*argument-list*)

Description: Computes the most frequently occurring of the numeric values of its arguments. If the set of values contains more than one most-frequent value, the first occurrence of any most-frequent value in the list is used as the result.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, arrays, reference to number. Any <i>argument</i> can be an array or a reference to an array. | The <i>arguments</i> in <i>argument-list</i> designate the values whose mode is to be computed. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The most frequently occurring of the values of its arguments.

However, if the data set contains no duplicate data points, #N/A is returned.

[Example:

MODE(9,1,5,1,9,5,6,6) results in 9

MODE(1,9,5,1,9,5,6,6) results in 1

MODE(5,1,9,5,1,9,6,6) results in 5

end example]

18.17.7.220 MONTH

Syntax:

MONTH (*date-value*)

Description: Computes the numeric month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

| Name | Type | Description |
|-------------------|--------------|--|
| <i>date-value</i> | number, text | The date and/or time whose month is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored. |

Return Type and Value: number – The month in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, in the range 1–12.

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

MONTH(DATE(2006,1,2)) results in 1
MONTH(DATE(2006,0,2)) results in 12
MONTH("2006/1/2 10:45 AM") results in 1
MONTH(30000) results in 2 for both the 1900 and 1904 date base systems

end example]

18.17.7.221 MROUND

Syntax:

MROUND (*x* , *multiple*)

Description: Computes *x* rounded to *multiple*, away from zero. It rounds up if the remainder of dividing *x* by *multiple* is greater than or equal to half the value of *multiple*; otherwise, it rounds down.

Arguments:

| Name | Type | Description |
|----------|--------|---------------------|
| <i>x</i> | number | The value to round. |

| Name | Type | Description |
|-----------------|--------|---|
| <i>multiple</i> | number | The multiple to which x is to be rounded. |

Return Type and Value: number – x rounded to *multiple*.

However, if x and *multiple* have different signs, #NUM! is returned.

[Example:

MROUND(10, 3) rounds 10 to a nearest multiple of 3; that is, to 9

MROUND(-10, -3) rounds -10 to a nearest multiple of -3; that is, to -9

MROUND(1.3, 0.2) rounds 1.3 to a nearest multiple of 0.2; that is, to 1.4

end example]

18.17.7.222 MULTINOMIAL

Syntax:

MULTINOMIAL (*argument-list*)

Description: Computes the ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

Mathematical Formula:

The multinomial is:

$$MULTINOMIAL(a, b, c) = \frac{(a + b + c)!}{a! b! c!}$$

where:

- a, b, c, \dots = the elements in *argument-list*

Arguments:

| Name | Type | Description |
|----------------------|--------|---|
| <i>argument-list</i> | number | The <i>arguments</i> in <i>argument-list</i> designate the numerical values for which the multinomial is desired. |

Return Type and Value: number – The ratio of the factorial of the sum of the values in *argument-list* to the product of the factorials.

However, if any *argument* is less than zero, #NUM! is returned.

[Example:

MULTINOMIAL(2) results in 1

MULTINOMIAL(2,3) results in 10

MULTINOMIAL(2,3,4) results in 1260

end example]

18.17.7.223 N

Syntax:

N (*value*)

Description: Converts *value* to a number or, if *value* is a reference to a single cell, converts the value of that cell to a number.

Arguments:

| Name | Type | Description |
|--------------|------|------------------------|
| <i>value</i> | any | Value to be converted. |

Return Type and Value: number or error – An integer that is the converted value of *value*, or, if *value* is a reference to a single cell, the converted value of that cell, as follows:

| <i>value</i> | Value Returned |
|--|------------------|
| number | That number |
| TRUE | 1 |
| FALSE | 0 |
| error value | That error value |
| Anything else (including array and text) | 0 |

[Example:

N(10.5) results in 10.5

N(A10) results in -1234, when A10 contains the number -1234

N("ABC") results in 0

N(A10) results in 0, when A10 contains the string ABC

N(TRUE) results in 1

N(A10) results in 0, when A10 contains FALSE

N(A10) results in #N/A, when A10 contains #N/A

$N(\{12.5, 13.6, 56.9\})$ results in 12.50

$N(A10:A11)$ results in 0, when A10 contains FALSE, and A11 contains 321

end example]

18.17.7.224 NA

Syntax:

NA ()

Description: Gets the error value #N/A. (The error value #N/A can be used instead of a call to this function; the result is the same.)

Arguments: None.

Return Type and Value: error – The error value #N/A.

[Example:

NA() results in #N/A

IF(ISNA(NA()), "T", "F") results in T

end example]

18.17.7.225 NEGBINOMDIST

Syntax:

NEGBINOMDIST (*number-failures* , *number-successes* , *success-probability*)

Description: Computes the negative binomial distribution. NEGBINOMDIST returns the probability that there are *number-failures* failures before the *number-successes*th success, when the constant probability of a success is *success-probability*.

Mathematical Formula:

$$nb(x, r, p) = \binom{x+r-1}{r-1} p^r (1-p)^x$$

where:

- p = the argument *success-probability*.
- r = the argument *number-successes*
- x = the argument *number-failures*

Arguments:

| Name | Type | Description |
|----------------------------|--------|--|
| <i>number-failures</i> | number | The number of failures, truncated to integer. |
| <i>number-successes</i> | number | The threshold number of successes, truncated to integer. |
| <i>success-probability</i> | number | The probability of a success. |

Return Type and Value: number – The negative binomial distribution.

However, if

- *number-failures* < 0 or *number-successes* < 1, #NUM! is returned.
- *success-probability* < 0 or *success-probability* > 1, #NUM! is returned.

[Example:

NEGBINOMDIST(6,10,0.5) results in 0.076370239

end example]

18.17.7.226 NETWORKDAYS

Syntax:

NETWORKDAYS (*start-date* , *end-date* [, *holidays*])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days (Saturday, Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

| Name | Type | Description |
|-------------------|------------------|---|
| <i>start-date</i> | number | The dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> . |
| <i>end-date</i> | number | |
| <i>holidays</i> | reference, array | An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in <i>holidays</i> can be arbitrary. |

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- *end-date* is out of range for the current date base value, #NUM! is returned.

[Example:

NETWORKDAYS (DATE (2006,1,1),DATE (2006,1,31)) results in 23

NETWORKDAYS (DATE (2006,1,31),DATE (2006,1,1)) results in -23

NETWORKDAYS (DATE (2006,1,1),DATE (2006,2,1),{"2006/1/2","2006/1/16"}) results in 21

end example]

18.17.7.227 NETWORKDAYS.INTL

Syntax:

Number form: NETWORKDAYS.INTL (*start-date* , *end-date* [, [*weekend-number*][, *holidays*]])

String form: NETWORKDAYS.INTL (*start-date* , *end-date* [, [*weekend-string*][, *holidays*]])

Description: Computes the number of whole working days between *start-date* and *end-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

| Name | Type | Description |
|-----------------------|--------|--|
| <i>start-date</i> | Number | The dates for which the difference is to be computed. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> . |
| <i>end-date</i> | Number | |
| <i>weekend-number</i> | Number | Indicates the days of the week that are weekend days and are not included in the number of whole working days between <i>start-date</i> and <i>end-date</i> . Values are shown in the table below. |
| <i>weekend-string</i> | String | Indicates the days of the week that are weekend days and are not included in the number of whole working days between <i>start-date</i> and <i>end-date</i> . Values of <i>weekend-string</i> are seven characters long and each character in the string represents a day of the week, beginning with Monday. [Example: "0000011" would result in a weekend that is Saturday and Sunday. end example] |

| Name | Type | Description |
|-----------------|------------------|---|
| <i>holidays</i> | reference, array | An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in <i>holidays</i> can be arbitrary. |

| <i>weekend-number</i> | Weekend days |
|-----------------------|---------------------|
| 1 or omitted | Saturday, Sunday |
| 2 | Sunday, Monday |
| 3 | Monday, Tuesday |
| 4 | Tuesday, Wednesday |
| 5 | Wednesday, Thursday |
| 6 | Thursday, Friday |
| 7 | Friday, Saturday |
| 11 | Sunday only |
| 12 | Monday only |
| 13 | Tuesday only |
| 14 | Wednesday only |
| 15 | Thursday only |
| 16 | Friday only |
| 17 | Saturday only |

Return Type and Value: number – The number of whole working days between *start-date* and *end-date*, excluding the specified weekend days and holidays. If *start-date* is later than *end-date*, the return value shall be negative, and the magnitude shall be the number of whole working days.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- *end-date* is out of range for the current date base value, #NUM! is returned.

[Example:

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,1,31)) results in 23

NETWORKDAYS.INTL (DATE (2006,1,31),DATE (2006,1,1)) results in -23

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,2,1),7,{"2006/1/2","2006/1/16"}) results in 21

NETWORKDAYS.INTL (DATE (2006,1,1),DATE (2006,2,1),"0000110",{ "2006/1/2","2006/1/16"})
results in 21

end example]

18.17.7.228 NOMINAL

NOMINAL (*effect-rate* , *npery*)

Description: Computes the nominal annual interest rate, given the effective rate and the number of compounding periods per year.

Mathematical Formula:

NOMINAL is related to EFFECT:

$$EFFECT = \left(1 + \frac{Nominal_rate}{Npery} \right)^{Npery} - 1$$

where:

- *Nominal_rate* = argument *effect-rate*
- *Npery* = argument *npery*

Arguments:

| Name | Type | Description |
|--------------------|--------|---|
| <i>effect-rate</i> | number | The effective interest rate. |
| <i>npery</i> | number | The number of compounding periods per year, truncated to integer. |

Return Type and Value: **number** – The nominal annual interest rate.

However, if

- *effect-rate* ≤ 0, #NUM! is returned.
- *npery* < 1, #NUM! is returned.

[Example:

NOMINAL (0.053543,4) results in 5.2500%

end example]

18.17.7.229 NORMDIST

Syntax:

NORMDIST (*x* , *mean* , *standard-deviation* , *cumulative-flag*)

Description: Computes the normal distribution for the specified mean and standard deviation.

Mathematical Formula:

The equation for the normal density function (*cumulative-flag* = FALSE) is:

$$f(x, \mu, \sigma) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\left(\frac{(x-\mu)^2}{2\sigma^2}\right)}$$

When *cumulative-flag* = TRUE, the formula is the integral from negative infinity to *x* of the given formula.

where:

- *x* = argument *x*
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

| Name | Type | Description |
|---------------------------|---------|---|
| <i>x</i> | number | The value for which the distribution is to be computed. |
| <i>mean</i> | number | The arithmetic mean of the distribution. |
| <i>standard-deviation</i> | number | The standard deviation of the distribution. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, then the cumulative distribution function is returned; if FALSE, the probability mass function is returned. |

Return Type and Value: number – The normal distribution for the specified mean and standard deviation.

However, if *standard-deviation* ≤ 0, #NUM! is returned.

[Example:

NORMDIST(42,40,1.5,TRUE) results in 0.90878878

NORMDIST(42,40,1.5,FALSE) results in 0.10934005

end example]

18.17.7.230 NORMINV

Syntax:

NORMINV (*probability* , *mean* , *standard-deviation*)

Description: Computes the inverse of the normal distribution for the specified mean and standard deviation.**Arguments:**

| Name | Type | Description |
|---------------------------|--------|---|
| <i>probability</i> | number | The probability corresponding to the normal distribution. |
| <i>mean</i> | number | The arithmetic mean of the distribution. |
| <i>standard-deviation</i> | number | The standard deviation of the distribution. |

Return Type and Value: number – The inverse of the normal distribution for the specified mean and standard deviation.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- *standard-deviation* ≤ 0, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

NORMINV(0.908789,40,1.5) results in 42.00000201

end example]

18.17.7.231 NORMSDIST

Syntax:

NORMSDIST (*z*)

Description: Computes the standard normal distribution for the specified mean and standard deviation.

Mathematical Formula:

$$f(z) = \frac{1}{\sqrt{2\pi}} e^{-\frac{z^2}{2}}$$

where:

- *z* = argument *z*

Arguments:

| Name | Type | Description |
|----------|--------|---|
| <i>z</i> | number | The value for which the distribution is to be computed. |

Return Type and Value: number – The standard normal distribution for the specified mean and standard deviation.

[Example:

NORMSDIST(1.333333) results in 0.90878873

NORMSDIST(-1.5) results in 0.06680720

end example]

18.17.7.232 NORMSINV

Syntax:

NORMSINV (*probability*)

Description: Computes the inverse of the standard normal distribution. The distribution has a mean of zero and a standard deviation of 1.

Arguments:

| Name | Type | Description |
|--------------------|--------|---|
| <i>probability</i> | number | The probability corresponding to the normal distribution. |

Return Type and Value: number – The inverse of the standard normal distribution.

However, if

- *probability* < 0 or if *probability* > 1, #NUM! is returned.
- the implementation determines that a return value cannot be computed, #N/A is returned.

[Example:

NORMSINV(0.945) results in 1.59819314

NORMSINV(0.13) results in -1.12639113

end example]

18.17.7.233 NOT

Syntax:

NOT (*logical-value*)

Description: Computes the logical negation of *logical-value*.

Arguments:

| Name | Type | Description |
|----------------------|---------|--------------------------|
| <i>logical-value</i> | logical | The value to be negated. |

Return Type and Value: logical – The logical negation of *logical-value*; that is, it returns TRUE if *logical-value* is FALSE, and FALSE if *logical-value* is TRUE.

[Example:

NOT(TRUE) results in FALSE

NOT(FALSE) results in TRUE

NOT(10>5) results in FALSE

NOT(16.567) results in FALSE

end example]

18.17.7.234 NOW

Syntax:

NOW ()

Description: Computes the serial value of the current date and time, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date and time.

[Example: On February 26, 2006, between 23:01 and 23:02, NOW() resulted in 38774.95958611110 for the 1900 date base system. On February 26, 2006, between 23:02 and 23:03, NOW() resulted in 37312.95982569440 for the 1904 date base system. end example]

18.17.7.235 NPER

Syntax:

NPER (*rate* , *pmt* , *pv* [, [*fv*] [, [*type*]]])

Description: Computes the number of periods for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

| Name | Type | Description |
|-------------|--------|-------------------------------|
| <i>rate</i> | number | The interest rate per period. |

| Name | Type | Description | | | | | | |
|--------|--|--|-------|--------|---|----------------------------------|---|--|
| pmt | number | The payment made each period; it cannot change over the life of the annuity. Typically, pmt contains principal and interest but no other fees or taxes. | | | | | | |
| pv | number | The present value, or the lump-sum amount that a series of future payments is worth right now. | | | | | | |
| fv | number | The future value, or a cash balance to be attained after the last payment is made. If fv is omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0). | | | | | | |
| $type$ | number | The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Return Type and Value: number – The number of periods for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

NPV(0.12/12, -100, -1000, 10000, 1) results in 59.67

NPV(0.12/12, -100, -1000) results in -9.58

end example]

18.17.7.236 NPV

Syntax:

NPV (*rate* , *argument-list*)

Description: Calculates the net present value of an investment by using a discount rate and a series of future payments and income.

The NPV investment begins one period before the date of the first *argument* cash flow and ends with the last cash flow in the list. The calculation is based on future cash flows. If the first cash flow occurs at the beginning of the first period, the first value shall be added to the NPV result, not included in *argument-list*.

Mathematical Formula:

If n is the number of cash flows in the list of values:

$$NPV = \sum_{i=1}^n \frac{values_i}{(1 + rate)^i}$$

where:

n is the number of elements in *argument-list*.

$values_i$ is the value of the i -th element in *argument-list*.

$rate$ is the *rate* argument.

Arguments:

| Name | Type | Description |
|----------------------|--------|--|
| <i>rate</i> | number | The rate of discount over the length of one period. |
| <i>argument-list</i> | number | The <i>arguments</i> in <i>argument-list</i> designate the series of future payments (negative values) and income (positive values). <i>arguments</i> shall be equally spaced in time and occur at the end of each period. The order of <i>arguments</i> is significant. <i>arguments</i> that are numbers, empty cells, logical values, or text representations of numbers are included; <i>arguments</i> that are error values or text that cannot be translated into numbers are ignored. If an <i>argument</i> is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored. |

Return Type and Value: number – Net present value of an investment by using a discount rate and a series of future payments and income.

[Example:

NPV(0.1, -10000, 3000, 4200, 6800) results in 1188.44

end example]

18.17.7.237 OCT2BIN

Syntax:

OCT2BIN (*number* [, *num-bin-digits*])

Description: Makes the binary equivalent of *number*, with the result having *num-bin-digits* digits.

Arguments:

| Name | Type | Description |
|-------------------------|--------|---|
| <i>number</i> | text | A 10-digit octal number in a string that is to be converted to a binary string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit. |
| <i>num-bin - digits</i> | number | The number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-bin-digits</i> is ignored and the result has 10 digits. If <i>num-bin-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-bin-digits</i> is truncated to an integer. |

Return Type and Value: text – The binary equivalent of *number*.

However, if

- *number* is outside the range "7777777000" (111111111111111111000000000 binary, -512 decimal) to "777" (000000000000000000000111111111 binary, 511 decimal), inclusive, #NUM! is returned.
- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits, #NUM! is returned.
- *number* needs more digits than *num-bin-digits*, #NUM! is returned.
- *num-bin-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2BIN("67") results in 110111

OCT2BIN("7777777776") results in 1111111110

OCT2BIN("7",5) results in 00111

end example]

18.17.7.238 OCT2DEC

Syntax:

OCT2DEC (*number*)

Description: Makes the decimal equivalent of *number*.

Arguments:

| Name | Type | Description |
|---------------|--------|---|
| <i>number</i> | number | A 10-digit octal number in a string that is to be converted to a decimal number. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit. |

Return Type and Value: number – The decimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (-536,870,912 decimal) to "3777777777" (536,870,911 decimal), inclusive, #NUM! is returned.

[Example:

OCT2DEC("67") results in 55

OCT2DEC("7777777776") results in -2

OCT2DEC("7000000000") results in -134217728

end example]

18.17.7.239 OCT2HEX

Syntax:

OCT2HEX (*number* [, *num-hex-digits*])

Description: Makes the hexadecimal equivalent of *number*, with the result having *num-hex-digits* digits.

Arguments:

| Name | Type | Description |
|-----------------------|--------|---|
| <i>number</i> | text | A 10-digit octal number in a string that is to be converted to a hexadecimal string. If <i>number</i> has less than 10 digits, leading zero digits are implied until it has exactly 10 digits. The 10 digits use twos-complement representation with the left-most bit (30th bit from the right) representing the sign bit. |
| <i>num-hex-digits</i> | number | <i>num-hex-digits</i> is the number of digits in the result, with leading zeros added as necessary. However, if <i>number</i> is negative, <i>num-hex-digits</i> is ignored and the result has 10 digits. If <i>num-hex-digits</i> is omitted, the minimum number of digits is used in the result. <i>num-hex-digits</i> is |

| Name | Type | Description |
|------|------|--------------------------|
| | | truncated to an integer. |

Return Type and Value: text – The hexadecimal equivalent of *number*.

However, if

- *number* contains one or more non-octal digits, #NUM! is returned.
- *number* contains more than 10 octal digits; that is, *number* is outside the range "4000000000" (20000000 hex, -536,870,912 decimal) to "3777777777" (1FFFFFFF hex, 536,870,911 decimal), inclusive, #NUM! is returned.
- *number* needs more digits than *num-hex-digits*, #NUM! is returned.
- *num-hex-digits* ≤ 0 or > 10, #NUM! is returned.

[Example:

OCT2HEX("777") results in 1FF

OCT2HEX("7777777776") results in FFFFFFFFEE

OCT2HEX("7",5) results in 00007

end example]

18.17.7.240 ODD

Syntax:

ODD (*x*)

Description: Computes *x* rounded to the nearest odd integer, away from zero. Regardless of the sign of *x*, a value is rounded up when adjusted away from zero.

Arguments:

| Name | Type | Description |
|----------|--------|--------------------------|
| <i>x</i> | number | The value to be rounded. |

Return Type and Value: number – The rounded value of *x*.

[Example:

ODD(1.5) rounds 1.5 up to the nearest odd integer; that is, to 3

ODD(3) rounds 3 up to the nearest odd integer; that is, to 3

ODD(2) rounds 2 up to the nearest odd integer; that is, to 3

ODD(-1) rounds -1 up to the nearest odd integer; that is, to -1

ODD(-2) rounds -2 up to the nearest odd integer; that is, to -3

end example]

18.17.7.241 ODDFPRICE

Syntax:

ODDFPRICE (*settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *yld* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the price per \$100 face value of a security having an odd (short or long) first period.

Mathematical Formula:

Odd short first coupon:

$$ODDFPRICE = \left[\frac{\text{redemption}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N-1+\frac{DSC}{E}\right)}} \right] + \left[\frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{DFC}{E}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\frac{DSC}{E}}} \right] + \left[\sum_{k=2}^N \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(k-1+\frac{DSC}{E}\right)}} \right] - \left[100 \times \frac{\text{rate}}{\text{frequency}} \times \frac{A}{E} \right]$$

where:

- A = number of days from the beginning of the coupon period to the settlement date (accrued days).
- DFC = number of days from the beginning of the odd first coupon to the first coupon date.
- DSC = number of days from the settlement to the next coupon date.
- E = number of days in the coupon period.
- frequency = argument *frequency*
- N = number of coupons payable between the settlement date and the redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- rate = argument *rate*
- redemption = argument *redemption*
- yld = argument *yld*

Odd long first coupon:

$$\begin{aligned}
\text{ODDFPRICE} = & \left[\frac{\text{redemption}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(N + N_q + \frac{\text{DSC}}{E}\right)}} \right] + \left[\frac{100 \times \frac{\text{rate}}{\text{frequency}} \times \left[\sum_{i=1}^{NC} \frac{\text{DC}_i}{\text{NL}_i} \right]}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{N_q + \frac{\text{DSC}}{E}}} \right] \\
& + \left[\sum_{k=1}^N \frac{100 \times \frac{\text{rate}}{\text{frequency}}}{\left(1 + \frac{\text{yld}}{\text{frequency}}\right)^{\left(k - N_q + \frac{\text{DSC}}{E}\right)}} \right] - \left[100 \times \frac{\text{rate}}{\text{frequency}} \times \sum_{i=1}^{NC} \frac{A_i}{\text{NL}_i} \right]
\end{aligned}$$

where:

- A_i = number of days from the beginning of the i th, or last, quasi-coupon period within odd period.
- DC_i = number of days from dated date (or issue date) to first quasi-coupon ($i = 1$) or number of days in quasi-coupon ($i = 2, \dots, i = NC$).
- DSC = number of days from settlement to next coupon date.
- E = number of days in coupon period.
- frequency = argument *frequency*
- N = number of coupons payable between the first real coupon date and redemption date. (If this number contains a fraction, it is raised to the next whole number.)
- NC = number of quasi-coupon periods that fit in odd period. (If this number contains a fraction, it is raised to the next whole number.)
- NL_i = normal length in days of the full i th, or last, quasi-coupon period within odd period.
- N_q = number of whole quasi-coupon periods between settlement date and first coupon.
- rate = argument *rate*
- redemption = argument *redemption*
- yld = argument *yld*

...Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>settlement</i> | number | The security's settlement date. |
| <i>maturity</i> | number | The security's maturity date. |
| <i>issue</i> | number | The security's issue date. |
| <i>first-coupon</i> | number | The security's first coupon date. |
| <i>rate</i> | number | The security's interest rate. |
| <i>yld</i> | number | The security's annual yield. |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. |
| <i>frequency</i> | number | the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, |

| Name | Type | Description | | | | | | | | |
|--------------|---|--|-------|-----------------|--------------|---|---|---|---|-------------------------------|
| | | <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) | | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February.. |

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security having an odd (short or long) first period.

However, if

- *settlement*, *maturity*, *issue*, or *first-coupon* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *first-coupon*, which is later than *settlement*, which is later than *issue*, so #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDFPRICE (DATE (2008,11,11),DATE (2021,3,1),DATE (2008,10,15),DATE (2009,3,1),
0.0785,0.0625,100,2,1) results in 113.5977

end example]

18.17.7.242 ODDFYIELD

Syntax:

ODDFYIELD (*settlement* , *maturity* , *issue* , *first-coupon* , *rate* , *pr* , *redemption* ,
frequency [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) first period.

Arguments:

| Name | Type | Description | | | | |
|---------------------|-------------------------------------|--|-------|-----------------|--------------|-------------------------------------|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |

end example]

18.17.7.244 ODDLYIELD

Syntax:

ODDLYIELD (*settlement* , *maturity* , *last-interest* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield of a security that has an odd (short or long) last period.

Mathematical Formula:

$$ODDLYIELD = \left[\frac{\left(redemption + \left(\left(\sum_{i=1}^{NC} \frac{DC_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right) \right) - \left(par + \left(\left(\sum_{i=1}^{NC} \frac{A_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right) \right)}{pr + \left(\left(\sum_{i=1}^{NC} \frac{A_i}{NL_i} \right) \times \frac{100 \times rate}{frequency} \right)} \right] \times \left[\frac{frequency}{\left(\sum_{i=1}^{NC} \frac{DSC_i}{NL_i} \right)} \right]$$

where:

- A_i = number of accrued days for the i^{th} , or last, quasi-coupon period within odd period counting forward from last interest date before redemption.
- DC_i = number of days counted in the i^{th} , or last, quasi-coupon period as delimited by the length of the actual coupon period.
- *frequency* = argument *frequency*
- *NC* = number of quasi-coupon periods that fit in odd period; if this number contains a fraction it is raised to the next whole number.
- NL_i = normal length in days of the i^{th} , or last, quasi-coupon period within odd coupon period.
- *par* = argument *par*
- *rate* = argument *rate*
- *redemption* = argument *redemption*

•

Arguments:

| Name | Type | Description |
|----------------------|--------|--|
| <i>settlement</i> | number | The security's settlement date. |
| <i>maturity</i> | number | The security's maturity date. |
| <i>last-interest</i> | number | The security's last coupon date. |
| <i>rate</i> | number | The security's interest rate. |
| <i>pr</i> | number | The security's price. |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. |
| <i>frequency</i> | number | the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) |

| Name | Type | Description | | | | | | | | |

Time information in the date arguments is ignored.

Return Type and Value: number – The yield of a security that has an odd (short or long) last period.

However, if

- *settlement*, *maturity*, or *last-interest* is out of range for the current date base value, #NUM! is returned.
- The following is not true: *maturity* is later than *settlement*, which is later than *last-interest*, so #NUM! is returned.

- *rate* or *pr* < 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

ODDLYIELD(DATE(2008,11,11),DATE(2021,3,1),DATE(2008,10,15),
0.0575,84.5,100,2,0) results in 4.5192%

end example]

18.17.7.245 OFFSET

Syntax:

OFFSET (*reference* , *rows* , *cols* [, [*height*] [, [*width*]]])

Description: Gets a reference to a range that is a specified number of rows and columns from a cell or range of cells. The reference that is returned can be a single cell or a range of cells. You can specify the number of rows and the number of columns to be returned.

Arguments:

| Name | Type | Description |
|------------------|-----------|---|
| <i>reference</i> | reference | Designates the base. <i>reference</i> shall refer to a cell or range of adjacent cells. |
| <i>rows</i> | number | The number of rows, up or down, that indicates the upper-left cell of the result to refer to. A positive value means below the starting reference; a negative value means above the starting reference. |
| <i>cols</i> | number | The number of columns, to the left or right, that the upper-left cell of the result to refer to. A positive value means to the right of the starting reference; a negative value means to the left of the starting reference. |
| <i>height</i> | number | The height, in rows, of the set of cells referred to by the resulting reference. This height shall be positive. If omitted, it is the same as the height of <i>reference</i> . |
| <i>width</i> | number | The width, in columns, of the set of cells referred to by the resulting reference. The width shall be positive. If omitted, it is the same as the width of <i>reference</i> . |

Return Type and Value: reference – A reference to a range that is a specified size and number of rows and columns from a cell or range of cells.

However, if

- *reference* does not refer to a cell or range of adjacent cells, #VALUE! is returned.
- The combination of *rows* and *cols* results outside the worksheet, #REF! is returned.

[Example:

OFFSET(C3,2,3,1,1) results in the value in cell F5

SUM(OFFSET(C3:E5, -1,0,3,3)) results in the sum of the range C2:E4

end example]

18.17.7.246 OR

Syntax:

OR (*argument-list*)

Description: Tests if any one or more *arguments* in *argument-list* are TRUE. The function evaluates all arguments prior to returning a value.

Arguments:

| Name | Type | Description |
|----------------------|----------------------------|---|
| <i>argument-list</i> | logical, array, reference. | The <i>arguments</i> in <i>argument-list</i> designate the values to be tested. For an array or cell reference, a cell that contains text or is empty shall be ignored. |

Return Type and Value: logical – TRUE if any one or more *arguments* in *argument-list* are TRUE; otherwise, FALSE.

However, if no logical values are found, the return value is unspecified.

[Example:

OR(TRUE) results in TRUE

OR(FALSE, FALSE) results in FALSE

OR(10=5, 3=1+2, 0) results in TRUE

OR({10,5,6,7}, TRUE, E6:F6) results in TRUE, when E6 contains FALSE and F6 contains 0

end example]

18.17.7.247 PEARSON

Syntax:

PEARSON (*array-1* , *array-2*)

Description: Computes the Pearson product moment correlation coefficient, a dimensionless index that ranges from -1.0 to 1.0, inclusive, and reflects the extent of a linear relationship between two data sets.

Mathematical Formula:

The formula for the Pearson product moment correlation coefficient, r , is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(array-1)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(array-2)`

Arguments:

| Name | Type | Description |
|----------------|--|---|
| <i>array-1</i> | number, name, array, reference to number | The set of independent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>array-2</i> | number, name, array, reference to number | The set of dependent numerical values. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The Pearson product moment correlation coefficient.

However, if

- *array-1* and *array-2* have a different number of data points, the return value is unspecified.
- *array-1* or *array-2* is empty, the return value is unspecified.

[Example:

`PEARSON({9,7,5,3,1},{10,6,1,5,3})` results in 0.699378606

end example]

18.17.7.248 PERCENTILE

Syntax:

PERCENTILE (*array* , *k*)

Description: Computes the k^{th} percentile of a set of values in a range.

Arguments:

| Name | Type | Description |
|--------------|------------------|--|
| <i>array</i> | array, reference | The set of numerical data that defines relative standing. |
| <i>k</i> | number | The percentile value in the range 0–1, inclusive. If <i>k</i> is not a multiple of $1/(n - 1)$, PERCENTILE interpolates to determine the value at the k^{th} percentile. |

Return Type and Value: number – The k^{th} percentile of a set of values in a range.

However, if

- *array* is empty, the return value is unspecified.
- *k* is < 0 or *k* > 1, #NUM! is returned.

[Example:

PERCENTILE({1,3,2,4},0.3) results in 1.9

PERCENTILE({1,3,2,4},0.75) results in 3.25

end example]

18.17.7.249 PERCENTRANK

Syntax:

PERCENTRANK (*array* , *x* [, *significance*])

Description: Computes the rank of a value in a data set as a percentage of the data set.

Arguments:

| Name | Type | Description |
|---------------------|------------------|--|
| <i>array</i> | array, reference | <i>array</i> is the set of numerical data that defines relative standing. |
| <i>x</i> | number | The value for which the rank is to be computed. If <i>x</i> does not match one of the values in <i>array</i> , PERCENTRANK interpolates to return the correct percentage rank. |
| <i>significance</i> | number | The number of significant digits for the returned percentage value. If omitted, a value of 3 is used. |

Return Type and Value: number – The rank of a value in a data set as a percentage of the data set.

However, if

- *array* is empty, the return value is unspecified.
- *significance* < 1, #NUM! is returned.

[Example:

PERCENTRANK({12,6,7,9,3,8},4) results in 0.066

PERCENTRANK({12,6,7,9,3,8},5) results in 0.133

end example]

18.17.7.250 PERMUT

Syntax:

PERMUT (*number* , *number-chosen*)

Description: Computes the number of permutations for *number-chosen* objects that can be selected from *number* objects. [Note: A permutation is any set or subset of objects or events where internal order is significant. Permutations are different from combinations, for which the internal order is not significant. Use this function for lottery-style probability calculations. end note]

Mathematical Formula:

$$P_{k,n} = \frac{n!}{(n - k)!}$$

where:

- *k* = argument *number-chosen*
- *n* = argument *number*

Arguments:

| Name | Type | Description |
|----------------------|--------|--|
| <i>number</i> | number | The total number of items available, truncated to integer. |
| <i>number-chosen</i> | number | The number of items in each permutation, truncated to integer. |

Return Type and Value: number – The number of different permutations of *number-chosen* in *number*.

However, if

- *number* < 0, #NUM! is returned.

- *number-chosen* < 0, #NUM! is returned.
- *number* < *number-chosen*, #NUM! is returned.

[Example:

PERMUT(8,2) results in 56

PERMUT(10,4) results in 5040

PERMUT(6,5) results in 720

end example]

18.17.7.251 PHONETIC

Syntax:

PHONETIC (*string*)

Description: Extracts the phonetic (furigana) characters from *string*. [Note: Furigana are aids used to indicate correct pronunciation of Japanese text. end note]

Arguments:

| Name | Type | Description |
|---------------|-----------------|--|
| <i>string</i> | text, reference | Designates a furigana string. If <i>string</i> is a cell range, the furigana string in the upper-left corner cell of that range is returned. |

Return Type and Value: text – The phonetic (furigana) characters from *string*.

However, if *string* is a range of non-contiguous cells, #N/A is returned.

18.17.7.252 PI

Syntax:

PI ()

Description: Computes the value π .

Arguments: None.

Return Type and Value: number – The value π .

[Example: The following results are displayed using 10 significant digits

PI() results in 3.141592654

PI()/2 results in 1.570796327

PI()*(2.5^2) results in 19.63495408

end example]

18.17.7.253 PMT

Syntax:

PMT (*rate* , *nper* , *p_v* [, [*f_v*] [, [*type*]]])

Description: Computes the payment for a loan based on constant payments and a constant interest rate.

Arguments:

| Name | Type | Description | | | | | | |
|-------------|--|--|-------|--------|---|----------------------------------|---|--|
| <i>rate</i> | number | The interest rate for the loan. | | | | | | |
| <i>nper</i> | number | The total number of payment for the loan. | | | | | | |
| <i>pv</i> | number | The present value, or the total amount that a series of future payments is worth now; also known as the principal. | | | | | | |
| <i>fv</i> | number | The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0). | | | | | | |
| <i>type</i> | number | The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Return Type and Value: number – The payment for a loan based on constant payments and a constant interest rate. (The payment returned by PMT includes principal and interest but no taxes, reserve payments, or fees sometimes associated with loans.)

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[*Example:*

PMT(0.08/12,10,10000) results in -1,037.03

PMT(0.08/12,10,10000,0,1) results in -1,030.16

end example]

18.17.7.254 POISSON

Syntax:

POISSON (*x* , *mean* , *cumulative-flag*)

Description: Computes the Poisson distribution.

Mathematical Formula:

For *cumulative-flag* = FALSE:

$$POISSON = \frac{e^{-\lambda} \lambda^x}{x!}$$

For *cumulative-flag* = TRUE:

$$CUMPOISSON = \sum_{k=0}^x \frac{e^{-\lambda} \lambda^k}{k!}$$

where:

- x = argument *x*
- λ = argument *mean*

Arguments:

| Name | Type | Description |
|------------------------|---------|---|
| <i>x</i> | number | The number of events, truncated to an integer. |
| <i>mean</i> | number | The expected numeric value. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, POISSON returns the cumulative Poisson probability that the number of random events occurring are between zero and <i>x</i> , inclusive; if FALSE, it returns the Poisson probability mass function that the number of events occurring is exactly <i>x</i> . |

Return Type and Value: number – The Poisson distribution.

However, if

- $x < 0$, #NUM! is returned.
- $mean \leq 0$, #NUM! is returned.

[Example:

POISSON(2,5,TRUE) results in 0.124652019

POISSON(2,5,FALSE) results in 0.084224337

end example]

18.17.7.255 POWER

Syntax:

POWER (x , y)

Description: Computes x raised to the power y .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The base and the number y is the exponent to which that base is raised. |
| y | number | The exponent to which the base is raised. |

Return Type and Value: number – x^y .

However, if

- The value of x is negative and y is not a whole number, #NUM! is returned.
- x is zero and y is less than or equal to zero, #DIV/0! is returned.
- The result cannot be represented as a number, #NUM! is returned.

[Example:

POWER(2,3) results in 8

POWER(2,0.5) results in 1.414213562

POWER(-1.234,5.0) results in -2.861381721

POWER(1.234,5.1) results in 2.922182358

end example]

18.17.7.256 PPMT

Syntax:

PPMT ($rate$, per , $nper$, pv [, [fv] [, [$type$]]])

Description: Computes the payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

Arguments:

| Name | Type | Description | | | | | | |
|-------------|--|--|-------|--------|---|----------------------------------|---|--|
| <i>rate</i> | number | The interest rate per period. | | | | | | |
| <i>per</i> | number | The the period and shall be in the range 1– <i>nper</i> . | | | | | | |
| <i>nper</i> | number | The total number of payment in an annuity. | | | | | | |
| <i>pv</i> | number | The present value, or the total amount that a series of future payments is worth now. | | | | | | |
| <i>fv</i> | number | The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0). | | | | | | |
| <i>type</i> | number | <div>The timing of the payment, truncated to integer, as follows:<table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table></div> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Return Type and Value: number – The payment on the principal for a given period for an investment based on periodic, constant payments and a constant interest rate.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

PPMT(0.1/12,1,2*12,2000) results in -75.62

PPMT(0.08,10,10,200000) results in -27,598.05

end example]

18.17.7.257 PRICE

Syntax:

PRICE (*settlement* , *maturity* , *rate* , *yld* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the price per \$100 face value of a security that pays periodic interest.

Mathematical Formula:

$$PRICE = \left[\frac{redemption}{\left(1 + \frac{yld}{frequency}\right)^{\left(N-1+\frac{DSC}{E}\right)}} \right] + \left[\sum_{k=1}^N \frac{100 \times \frac{rate}{frequency}}{\left(1 + \frac{yld}{frequency}\right)^{\left(k-1+\frac{DSC}{E}\right)}} \right] - \left(100 \times \frac{rate}{frequency} \times \frac{A}{E} \right)$$

where:

- *A* = number of days from beginning of coupon period to settlement date.
- *DSC* = number of days from settlement to next coupon date.
- *E* = number of days in coupon period in which the settlement date falls.
- *frequency* = argument *frequency*
- *N* = number of coupons payable between settlement date and redemption date.
- *rate* = argument *rate*
- *redemption* = argument *redemption*
- *yld* = argument *yld*

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|--|-------|-----------------|--------------|--|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>rate</i> | number | The security's interest rate. | | | | |
| <i>yield</i> | number | The security's annual yield. | | | | |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. | | | | |
| <i>frequency</i> | number | the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to |
| Value | Day Count Basis | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | <p>30 February.</p> <ul style="list-style-type: none"> For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> If the date |

| Name | Type | Description | | |
|------|------|-------------|--|--|
| | | | | <div>is 28 or 29 February, it is adjusted to 30 February.</div> <ul style="list-style-type: none">• For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *rate* or *yld* < 0, #NUM! is returned.
- *redemption* ≤ 0, #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

PRICE (DATE (2008, 2, 15), DATE (2017, 11, 15), 0.0575, 0.065, 100, 2, 0) results in 94.6344

end example]

18.17.7.258 PRICEDISC

Syntax:

PRICEDISC (*settlement* , *maturity* , *discount* , *redemption* [, [*basis*]])

Description: Computes the price per \$100 face value of a discounted security.

Mathematical Formula:

$$PRICEDISC = redemption - discount \times redemption \times \frac{DSM}{B}$$

where:

- B = number of days in year, depending on year basis.
- DSM = number of days from settlement to maturity.
- $discount$ = argument *discount*
- $redemption$ = argument *redemption*

Arguments:

| Name | Type | Description | | | | |
|-------------------|---|--|-------|-----------------|--------------|---|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>discount</i> | number | The security's discount rate. | | | | |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date</div></td></tr></table></div> | Value | Day Count Basis | 0 or omitted | <div>US (NASD) 30/360. If the second date</div> | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with |

| Name | Type | Description | | |
|------|------|-------------|--|--|
| | | | | a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* ≥ *maturity*, #NUM! is returned.
- *discount* or *redemption* ≤ 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4, #NUM! is returned.

[Example:

PRICEDISC (DATE (2008, 2, 16), DATE (2008, 3, 1), 0.0525, 100, 2) results in 99.7958

end example]

18.17.7.259 PRICEMAT

Syntax:

PRICEMAT (*settlement* , *maturity* , *issue* , *rate* , *yld* [, [*basis*]])

Description: Computes the price per \$100 face value of a security that pays interest at maturity.

Mathematical Formula:

$$PRICEMAT = \frac{100 + \left(\frac{IM}{B} \times rate \times 100\right)}{1 + \left(\frac{DSM}{B} \times yld\right)} - \left(\frac{A}{B} \times rate \times 100\right)$$

where:

- A = number of days from issue to settlement.
- B = number of days in year, depending on year basis.
- DIM = number of days from issue to maturity.
- DSM = number of days from settlement to maturity.
- $rate$ = argument $rate$
- yld = argument yld

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|---|-------|-----------------|--------------|--|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>issue</i> | number | The security's issue date. | | | | |
| <i>rate</i> | number | The security's interest rate. | | | | |
| <i>yld</i> | number | The security's annual yield. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. | | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The price per \$100 face value of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* or *yld* < 0 , #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

PRICEMAT (DATE (2008,2,15),DATE (2008,4,13),DATE (2007,11,11),0.061,0.061,0)
results in 99.9845

end example]

18.17.7.260 PROB

Syntax:

PROB (*x-range* , *probability-range* , *lower-limit* [, *upper-limit*])

Description: Computes the probability that values in a range are between two limits.

Arguments:

| Name | Type | Description |
|--------------------------|------------------|--|
| <i>x-range</i> | array, reference | The set of numeric values of <i>x</i> with which there are associated probabilities. |
| <i>probability-range</i> | array, reference | A set of numeric probabilities associated with the values in <i>x-range</i> . |
| <i>lower-limit</i> | number | The lower bound on the value for which the probability is to be computed. |
| <i>upper-limit</i> | number | The upper bound on the value for which the probability is to be computed. If omitted, the probability that values in <i>x-range</i> are equal to <i>lower-limit</i> is returned. |

Return Type and Value: number – The probability that values in a range are between two limits.

However, if

- Any value in *probability-range* ≤ 0 or any value in *probability-range* > 1 , #NUM! is returned.
- The sum of the values in *probability-range* < 1 , #NUM! is returned.
- *x-range* and *probability-range* contain a different number of data points, the return value is unspecified.

[Example:

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},2) results in 0.1

PROB({0,1,2,3},{0.2,0.3,0.1,0.4},1,4) results in 0.8

end example]

18.17.7.261 PRODUCT

Syntax:

PRODUCT (*argument-list*)

Description: Multiplies the numeric values of *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers to be multiplied. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored. |

Return Type and Value: number – The product of the values of its arguments.

[Example:

PRODUCT(1) results in 1

PRODUCT(1,2,3,4,5) results in 120

PRODUCT({1,2;3,4}) results in 24

PRODUCT({2,3},4,"5") results in 120

end example]

18.17.7.262 PROPER

Syntax:

PROPER (*string*)

Description: Makes a lowercase version of *string* except that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase.

Arguments:

| Name | Type | Description |
|---------------|-----------------|--|
| <i>string</i> | text, reference | Designates the string to be converted. |

Return Type and Value: text – A version of *string* such that the first letter in *string* and any other letters in *string* that immediately follow a character that is not a letter, are converted to uppercase. All other letters are converted to lowercase, and all other non-letters are unchanged.

[Example:

PROPER("12aBC d123aD#\$\$%sd^") results in 12Abc D123Ad#\$\$%Sd^

PROPER(A10) results in 12Abc D123Ad#\$\$%Sd^, when A10 contains 12aBC d123aD#\$\$%sd^

end example]

18.17.7.263 PV

Syntax:

PV (*rate* , *nper* , *pmt* [, [*fv*] [, [*type*]]])

Description: Computes the present value of an investment. (The present value is the total amount that a series of future payments is worth now.)

Mathematical Formula:

If *rate* is not 0, then:

$$pv * (1 + rate)^{nper} + pmt(1 + rate * type) * \left(\frac{(1 + rate)^{nper} - 1}{rate} \right) + fv = 0$$

If *rate* is 0, then:

$$(pmt \times nper) + pv + fv = 0(pmt * nper) + pv + fv = 0$$

where:

- *fv* = *fv* argument

- *nper* = *nper* argument
- *pmt* = *pmt* argument
- *rate* = *rate* argument
- *type* = *type* argument

Arguments:

| Name | Type | Description | | | | | | |
|-------------|--|--|-------|--------|---|----------------------------------|---|--|
| <i>rate</i> | number | The interest rate per period. | | | | | | |
| <i>nper</i> | number | The total number of payment in an annuity. | | | | | | |
| <i>pmt</i> | number | The payment made each period and cannot change over the life of the annuity. If is omitted, <i>fv</i> shall be provided. [Note: Typically, <i>pmt</i> includes principal and interest but no other fees or taxes. <i>end note</i>] | | | | | | |
| <i>fv</i> | number | The future value, or a cash balance to be attained after the last payment is made. If omitted, <i>pmt</i> shall be provided. | | | | | | |
| <i>type</i> | number | The timing of the payment, truncated to integer, as follows: <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | |

Return Type and Value: number – The present value of an investment.

However, if *type* is any number other than 0 or 1, #NUM! is returned.

[Example:

PV(0.08/12,12*20,500,,0) results in -59,777.15

end example]

18.17.7.264 QUARTILE

Syntax:

QUARTILE (*array* , *result-category*)

Description: Computes the quartile of a data set.

Arguments:

| Name | Type | Description | | | | | | | | | | | | |
|------------------------|----------------------------------|--|-------|----------------|---|---------------|---|----------------------------------|---|--------------------------------|---|----------------------------------|---|---------------|
| <i>array</i> | array, reference | The set of numeric values for which the quartile value is to be computed. | | | | | | | | | | | | |
| <i>result-category</i> | number | When truncated to an integer, specifies which value is to be returned, as follows: <table><tr><th>Value</th><th>Value Returned</th></tr><tr><td>0</td><td>Minimum value</td></tr><tr><td>1</td><td>First quartile (25th percentile)</td></tr><tr><td>2</td><td>Median value (50th percentile)</td></tr><tr><td>3</td><td>Third quartile (75th percentile)</td></tr><tr><td>4</td><td>Maximum value</td></tr></table> | Value | Value Returned | 0 | Minimum value | 1 | First quartile (25th percentile) | 2 | Median value (50th percentile) | 3 | Third quartile (75th percentile) | 4 | Maximum value |
| Value | Value Returned | | | | | | | | | | | | | |
| 0 | Minimum value | | | | | | | | | | | | | |
| 1 | First quartile (25th percentile) | | | | | | | | | | | | | |
| 2 | Median value (50th percentile) | | | | | | | | | | | | | |
| 3 | Third quartile (75th percentile) | | | | | | | | | | | | | |
| 4 | Maximum value | | | | | | | | | | | | | |

Return Type and Value: number – The quartile of a data set.

However, if

- *array* is empty, the return value is unspecified.
- *result-category* < 0 or *result-category* > 4, #NUM! is returned.

[Example:

QUARTILE({1,2,4,7,8,9,10,12},1) results in 3.5

end example]

18.17.7.265 QUOTIENT

Syntax:

QUOTIENT (*dividend* , *divisor*)

Description: Computes the integer portion of the division of *dividend* by *divisor*.

Arguments:

| Name | Type | Description |
|-----------------|--------|--------------|
| <i>dividend</i> | number | The dividend |
| <i>divisor</i> | number | The divisor. |

Return Type and Value: number – The integer portion of the division of *dividend* by *divisor*.

[Example:

QUOTIENT(5,2) results in 2

QUOTIENT(4.5,3.1) results in 1

QUOTIENT(-10,3) results in -3

end example]

18.17.7.266 RADIANS

Syntax:

RADIANS (*angle*)

Description: Converts *angle* in degrees into radians.

Arguments:

| Name | Type | Description |
|--------------|--------|--|
| <i>angle</i> | number | The angle expressed in degrees that is to be converted into radians. |

Return Type and Value: number – *angle* in radians.

[Example:

RADIANS(360) results in 6.283185307

RADIANS(270) results in 4.71238898

RADIANS(45) results in 0.785398163

RADIANS(8.5) results in 0.148352986

end example]

18.17.7.267 RAND

Syntax:

RAND ()

Description: Computes an evenly distributed random real number greater than or equal to 0 and less than 1. A new random real number is returned every time the cell's value is calculated.

Arguments: None.

Return Type and Value: number – An evenly distributed random real number greater than or equal to 0 and less than 1.

[Example:

RAND() results in 0.437337454

INT(RAND()*(6-1)+1) might result in 3

end example]

18.17.7.268 RANDBETWEEN

Syntax:

RANDBETWEEN (*lower-bound* , *upper-bound*)

Description: Computes a random integer number in the range *lower-bound–upper-bound*. A new random integer number is returned every time the cell's value is calculated.

Arguments:

| Name | Type | Description |
|--------------------|--------|--|
| <i>lower-bound</i> | number | The smallest integer that is returned. |
| <i>upper-bound</i> | number | The largest integer that is returned. |

Return Type and Value: number – A random integer number in the range specified.

However, if *lower-bound* is greater than *upper-bound*, #NUM! is returned.

[Example:

RANDBETWEEN(1,6) results in an integer between 1 and 6, inclusive

RANDBETWEEN(-10,10) results in an integer between -10 and 10, inclusive

end example]

18.17.7.269 RANK

Syntax:

RANK (*number* , *number-list* [, *order*])

Description: Computes the rank of a number in a list of numbers. RANK gives duplicate numbers the same rank. However, the presence of duplicate numbers affects the ranks of subsequent numbers.

Arguments:

| Name | Type | Description |
|---------------|--------|---------------------------------------|
| <i>number</i> | number | The number whose rank is to be found. |

| Name | Type | Description |
|--------------------|-----------|--|
| <i>number-list</i> | reference | Designates the list of numbers. Non-numeric values in this list are ignored. |
| <i>order</i> | number | Specifies how <i>number</i> is to be ranked. If zero or omitted, <i>number</i> is ranked as if the list were sorted in descending order. If <i>order</i> is any non-zero value, <i>number</i> is ranked as if the list were sorted in ascending order. |

Return Type and Value: number – The rank of a number in a list of numbers.

[Example:

When the cells E1:I1 contain 7, 3.5, 3.5, 1, and 2

RANK(E2,E1:I1,1) results in 3

RANK(E2,E1:I1,1,0) results in 2

RANK(E2,E1:I1,1) results in 2

RANK(E1,E1:I1,1) results in 5, as the two 3.5 values both have a rank of 3; no value has rank 4.

end example]

18.17.7.270 RATE

Syntax:

RATE (*nper* , *pmt* , *pv* [, [*fv*] [, [*type*] [, [*guess*]]]])

Description: Computes the interest rate per period of an annuity, using iteration, which can result in zero or more solutions.

Arguments:

| Name | Type | Description |
|-------------|--------|--|
| <i>nper</i> | number | The total number of payment periods. |
| <i>pmt</i> | number | The payment made each period and cannot change over the life of the annuity. (Typically, <i>pmt</i> includes principal and interest but no other fees or taxes.) If omitted, <i>fv</i> shall be present. |
| <i>pv</i> | number | The present value. |
| <i>fv</i> | number | The future value, or a cash balance to be attained after the last payment is made. If omitted, it is assumed to be 0 (i.e., the future value of a loan, for example, is 0). |
| <i>type</i> | number | The timing of the payment, truncated to integer, as follows: |

| Name | Type | Description | | | | | | | |
|--------------|--|--|---|-------|--------|---|----------------------------------|---|--|
| | | | <table><tr><th>Value</th><th>Timing</th></tr><tr><td>0</td><td>Payment at the end of the period</td></tr><tr><td>1</td><td>Payment at the beginning of the period</td></tr></table> | Value | Timing | 0 | Payment at the end of the period | 1 | Payment at the beginning of the period |
| Value | Timing | | | | | | | | |
| 0 | Payment at the end of the period | | | | | | | | |
| 1 | Payment at the beginning of the period | | | | | | | | |
| <i>guess</i> | number | A guess for what the rate are. If omitted, it is assumed to be 10 percent. | | | | | | | |

Return Type and Value: number – The interest rate per period of an annuity.

However, if

- *type* is any number other than 0 or 1, #NUM! is returned.
- The result has not converged after an implementation-defined number of iterations, #NUM! is returned.

[Example:

RATE(4*12, -200, 8000) results in 0.7701%

RATE(4*12, -200, 8000)*12 results in 9.2418%

end example]

18.17.7.271 RECEIVED

Syntax:

RECEIVED (*settlement* , *maturity* , *investment* , *discount* [, [*basis*]])

Description: Computes the amount received at maturity for a fully invested security.

Mathematical Formula:

$$RECEIVED = \frac{investment}{1 - \left(discount \times \frac{DIM}{B} \right)}$$

where:

- *B* = number of days in a year, depending on the year basis.
- *DIM* = number of days from issue to maturity.
- *discount* = argument *discount*
- *investment* = argument *investment*

Arguments:

| Name | Type | Description | | | | | | |
|-------------------|--|--|-------|-----------------|--------------|--|---|--|
| <i>settlement</i> | number | The security's settlement date. | | | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | | | |
| <i>investment</i> | number | The amount invested in the security. | | | | | | |
| <i>discount</i> | number | The security's discount rate. | | | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</td></tr></table></div> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the |
| Value | Day Count Basis | | | | | | | |
| 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | | | | | | | |
| 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The amount received at maturity for a fully invested security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *investment* or *discount* \leq 0, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

RECEIVED(DATE(2008,2,15),DATE(2008,5,15),1000000,0.0575,2) results in 1014584.65

end example]

18.17.7.272 REPLACE

Syntax:

REPLACE (*string-1* , *start-pos* , *number-chars* , *string-2*)

Description: Produces a new string that is *string-1* with *number-chars* characters starting at position *start-pos*, replaced by *string-2*. (REPLACE is intended for use with languages that use the single-byte character set (SBCS), whereas REPLACEB (§18.17.7.273) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>string-1</i> | text | Designates a string. |
| <i>start-pos</i> | number | The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-chars</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> . |
| <i>number-chars</i> | number | The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> . |
| <i>string-2</i> | text | Designates a string. |

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-chars* < 0, #VALUE! is returned.

[Example:

REPLACE("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACE("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACE("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

18.17.7.273 REPLACEB

Syntax:

REPLACEB (*string-1* , *start-pos* , *number-bytes* , *string-2*)

Description: Produces a new string that is *string-1* with *number-bytes* bytes starting at position *start-pos*, replaced by *string-2*. (REPLACEB is intended for use with languages that use the double-byte character set (DBCS), whereas REPLACE (§18.17.7.272) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>string-1</i> | text | Designates a string. |
| <i>start-pos</i> | number | The number of the start position within <i>string-1</i> from which characters in <i>string-1</i> are to be replaced. The start position of the first character is 1. <i>start-pos</i> shall be at least 0. If <i>start-pos</i> is beyond the end of <i>string-1</i> , the result is a new string that is <i>string-2</i> appended to <i>string-1</i> . If <i>start-pos</i> is within the bounds of <i>string-1</i> , but <i>number-bytes</i> goes beyond the end of <i>string-1</i> , the characters starting at position <i>start-pos</i> through to the end of <i>string-1</i> shall be replaced by <i>string-2</i> . |
| <i>number-bytes</i> | number | The number of characters within <i>string-1</i> that are to be replaced by the string designated by <i>string-2</i> . |
| <i>string-2</i> | text | Designates a string. |

Return Type and Value: text – A copy of *string-1* with replacement characters from *string-2*.

However, if

- *start-pos* < 0, #VALUE! is returned.
- *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

REPLACEB("abcdefghijk",3,4,"XY") results in abXYghijk

REPLACEB("abcdefghijk",3,1,"12345") results in ab12345defghijk

REPLACEB("abcdefghijk",15,4,"XY") results in abcdefghijkXY

end example]

18.17.7.274 REPT

Syntax:

REPT (*string* , *replication-count*)

Description: Creates a string that is *replication-count* number of occurrences of *string* concatenated together.

Arguments:

| Name | Type | Description |
|--------------------------|--------|---|
| <i>string</i> | text | Designate the string to be replicated. |
| <i>replication-count</i> | number | The number of times <i>string</i> is to be replicated, truncated to integer. If <i>replication-count</i> is 0, the resulting string is empty. |

Return Type and Value: text – The final replicated string.

However, if *replication-count* < 0, #VALUE! is returned.

[Example:

REPT("ABC",3) results in ABCABCABC

LEN(REPT("ABC",0)) results in 0

end example]

18.17.7.275 RIGHT

Syntax:

RIGHT (*string* [, *number-chars*])

Description: Extracts the right-most *number-chars* characters from *string*. (RIGHT is intended for use with languages that use the single-byte character set (SBCS), whereas RIGHTB (§18.17.7.276) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-chars</i> | number | The number of characters to be extracted. If omitted, a count of 1 shall be assumed. <i>number-chars</i> shall be at least 0. If <i>number-chars</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing the right-most *number-chars* characters from *string*.

However, if *number-chars* < 0, #VALUE! is returned.

[Example:

RIGHT("abcdef", 2) results in ef

RIGHT(A10, 4) results in z123, when A10 contains xyz123

end example]

18.17.7.276 RIGHTB

Syntax:

RIGHTB (*string* , [*number-bytes*])

Description: Extracts the right-most *number-bytes*-worth of characters from *string*. (RIGHTB is intended for use with languages that use the double-byte character set (DBCS), whereas RIGHT (§18.17.7.275) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>string</i> | text | Designate the string from which a substring is to be extracted. |
| <i>number-bytes</i> | number | The number of bytes to be extracted. If omitted, a count of 1 shall be assumed. <i>number-bytes</i> shall be at least 0. If <i>number-bytes</i> exceeds the length of <i>string</i> , the whole of <i>string</i> shall be extracted. |

Return Type and Value: text – A string containing the right-most *number-bytes*-worth of characters from *string*.

However, if *number-bytes* < 0, #VALUE! is returned.

[Example: Assuming 1-byte characters:

RIGHTB("abcdef",2) results in ef

RIGHTB(A10,4) results in z123, when A10 contains xyz123

end example]

18.17.7.277 ROMAN

Syntax:

ROMAN (*number* , *form*)

Description: Converts the Arabic number, *number*, to a Roman number according to *form*.

Arguments:

| Name | Type | Description | | | | | | | | | | |
|---------------------------|---|--|-------|------|---------------------------|--|---|---|---|---|---|--|
| <i>number</i> | number | The Arabic number to be converted. | | | | | | | | | | |
| <i>form</i> | number | <div>Specifies the type of Roman numeral to be produced. The Roman numeral style ranges from Classic to Simplified, becoming more concise as the value of <i>form</i> increases, as follows:</div> <table><tr><th>Value</th><th>Type</th></tr><tr><td>0, omitted, or TRUE</td><td>Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>1</td><td>Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>2</td><td>More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one.</td></tr><tr><td>3</td><td>Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that</td></tr></table> | Value | Type | 0, omitted, or TRUE | Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | 1 | Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | 2 | More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | 3 | Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that |
| Value | Type | | | | | | | | | | | |
| 0, omitted, or TRUE | Classic. Only subtract powers of ten (but not L or V). Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | | | | | | | | | | | |
| 1 | Concise. Allow subtractraction of L and V as well as powers of ten. Do not subtract a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | | | | | | | | | | | |
| 2 | More concise. Allow subtractraction of L (but not V) as well as powers of ten. Allow subtraction of a number from one that is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. | | | | | | | | | | | |
| 3 | Most concise. Allow subtractraction of L and V as well as powers of ten. Allow subtraction of a number from one that | | | | | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | is more than 10 times greater. If another letter follows the larger one, it shall be smaller than the number preceding the larger one. |
| | | 4 or FALSE | Simplified. Produce the fewest Roman digits. |

Return Type and Value: text – The corresponding Roman number.

However, if

- *number* < 0 or > 3999, #VALUE! is returned.
- *form* is not one of the values listed above, #VALUE! is returned.

[Example:

ROMAN(499,0) results in CDXCIX, which is 100 less than 500, plus 10 less than 100, plus one less than 10.

ROMAN(499,1) results in LDVLIV, which is 50 less than 500, plus 5 less than 50, plus one less than 5.

ROMAN(499,2) results in XDIX, which is 10 less than 500, plus one less than 10.

ROMAN(499,3) results in VDIV, which is 5 less than 500, plus one less than 5.

ROMAN(499,4) results in ID, which is 1 less than 500.

ROMAN(2013,0) results in MMXIII, which is 2,000, plus 10, plus 3.

end example]

18.17.7.278 ROUND

Syntax:

ROUND (*x* , *number-digits*)

Description: Rounds *x* to the number of digits specified by *number-digits*.

Arguments:

| Name | Type | Description |
|----------------------|--------|--|
| <i>x</i> | number | The value to be rounded. |
| <i>number-digits</i> | number | The number of digits to which <i>x</i> is to be rounded. If <i>number-digits</i> is greater than 0, <i>x</i> is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, <i>x</i> is rounded to the nearest integer. If <i>number-digits</i> is less than 0, <i>x</i> is rounded to the left of the decimal point. |

Return Type and Value: number – The rounded value of x . When rounding, digits 0–4 round down, while digits 5–9 round up.

[Example:

ROUND(2.15,1) results in 2.2

ROUND(2.149,1) results in 2.1

ROUND(-1.475,2) results in -1.48

ROUND(21.5,-1) results in 20

end example]

18.17.7.279 ROUNDDOWN

Syntax:

ROUNDDOWN (x , *number-digits*)

Description: Computes x rounded down, toward zero, to the number of digits specified by *number-digits*. [Note: ROUNDDOWN behaves like ROUND (§18.17.7.278), except that ROUNDDOWN always rounds a number down. end note]

Arguments:

| Name | Type | Description |
|----------------------|--------|--|
| x | number | The value to be rounded down. |
| <i>number-digits</i> | number | The number of digits to which x is to be rounded. If <i>number-digits</i> is greater than 0, x is rounded to the specified number of decimal places. If <i>number-digits</i> is 0, x is rounded to the nearest integer. If <i>number-digits</i> is less than 0, x is rounded to the left of the decimal point. |

Return Type and Value: number – The rounded-down value of x .

[Example:

ROUNDDOWN(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUNDDOWN(76.9,0) rounds 76.9 down to zero decimal places; that is, to 76

ROUNDDOWN(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.141

ROUNDDOWN(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.1

ROUNDDOWN(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31400

end example]

18.17.7.280 ROUNDUP

Syntax:

ROUNDUP (*x* , *number-digits*)

Description: Computes *x* rounded up, away from zero, to the number of digits specified by *number-digits*. [Note: ROUNDUP behaves like ROUND (§18.17.7.278), except that ROUNDUP always rounds a number up. *end note*]

Arguments:

| Name | Type | Description |
|----------------------|--------|---|
| <i>x</i> | number | The value to be rounded up. |
| <i>number-digits</i> | number | The number of digits to which <i>x</i> is to be rounded. If <i>number-digits</i> is greater than 0, <i>x</i> is rounded up to the specified number of decimal places. If <i>number-digits</i> is 0, <i>x</i> is rounded up to the nearest integer. If <i>number-digits</i> is less than 0, <i>x</i> is rounded up to the left of the decimal point. |

Return Type and Value: number – The rounded-up value of *x*.

[Example:

ROUNDDOWN(3.2,0) rounds 3.2 down to zero decimal places; that is, to 3

ROUNDDOWN(76.9,0) rounds 76.9 down to zero decimal places; that is, to 76

ROUNDDOWN(3.14159,3) rounds 3.14159 down to three decimal places; that is, to 3.142

ROUNDDOWN(-3.14159,1) rounds -3.14159 down to one decimal place; that is, to -3.2

ROUNDDOWN(31415.92654,-2) rounds 31415.92654 down to two decimal places to the left of the decimal; that is, to 31500

end example]

18.17.7.281 ROW

Syntax:

ROW ([*reference*])

Description: Finds the number of the row(s) corresponding to *reference*.

Arguments:

| Name | Type | Description |
|------------------|---|---|
| <i>reference</i> | reference to a single cell or to a range of | If omitted, the behavior is as if <i>reference</i> referred to the cell containing the formula. |

| Name | Type | Description |
|------|------------------|-------------|
| | contiguous cells | |

Return Type and Value: number – If *reference* refers to a single cell or to a single row of cells, the corresponding row is returned. If *reference* refers to a range of cells involving multiple rows, a vertical array of the corresponding rows as numbers is returned.

However, if the range of cells referred to by *reference* is not contiguous, #REF! is returned.

[Example:

ROW() results in 16, when the cell containing the formula is in row 16

ROW(E17:G17) results in 17

ROW(E16:G17) results in a vertical array containing 16 and 17, respectively

end example]

18.17.7.282 ROWS

Syntax:

ROWS (*array*)

Description: Finds the number of rows corresponding to *array*.

Arguments:

| Name | Type | Description |
|--------------|--|----------------|
| <i>array</i> | array, reference to a single cell, or a reference to a range of contiguous cells | A set of rows. |

Return Type and Value: number – The number of rows corresponding to *array*.

However, if the range of cells referred to by *array* is not contiguous, #NULL! is returned.

[Example:

ROWS(E16:H16) results in 1

ROWS(E16:G18) results in 3

ROWS({1,2;3,4}) results in 2

end example]

18.17.7.283 RSQ

Syntax:

RSQ (*known-ys* , *known-xs*)

Description: Computes the square of the Pearson product moment correlation coefficient through data points in known ys and known xs.

Mathematical Formula:

The equation for the Pearson product moment correlation coefficient, *r*, is:

$$r = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sqrt{\sum(x - \bar{x})^2 \sum(y - \bar{y})^2}}$$

where:

- *x* = a sample value
- \bar{x} = the sample mean AVERAGE(*known-xs*)
- *y* = a sample value
- \bar{y} = the sample mean AVERAGE(*known-ys*)

Arguments:

| Name | Type | Description |
|-----------------|--|---|
| <i>known-xs</i> | number, name, array, or reference to number, text, logical | Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>known-ys</i> | number, name, array, or reference to number, text, logical | Designate a set of numeric data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The square of the Pearson product moment correlation coefficient.

However, if

- *known-ys* and *known-xs* are empty or have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* contain only one data point, the return value is unspecified.

[Example:

RSQ({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 0.057950192

end example]

18.17.7.284 RTD

Syntax:

RTD (*progID* , [*rtd-server*] , *argument-list*)

Description: Retrieves data from a program in real-time. Periodically, this function returns new values and causes recalculation of the expression containing the call to it.

Arguments:

| Name | Type | Description |
|----------------------|------|--|
| <i>progID</i> | text | The name of the program from which the data is to be retrieved. |
| <i>rtd-server</i> | text | An optional string that is specific to the program with which RTD is communicating. |
| <i>argument list</i> | any | The presence and meaning of each <i>argument</i> in <i>argument-list</i> is specific to the program with which RTD is communicating. |

Return Type and Value: array – The set of values returned by the program with which RTD is communicating.

[Example: Consider a stockprice program that is called as follows:

RTD("stockprice.rtd","NASD","MSFT")

The result it returns—the price of the stock MSFT according to NASD—changes over time, often every few seconds.

The *rtd-server* program could also be written to accept multiple arguments, allowing calls like the following::

RTD("stockprice.rtd","NASD","MSFT","GOOG","AMZN")

where three stock values are requested.

end example]

18.17.7.285 SEARCH

Syntax:

SEARCH (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. (SEARCH is intended for use with languages that use the single-byte character set (SBCS), whereas SEARCHB (§18.17.7.286) is intended for use with languages that use the double-byte character set (DBCS).)

Arguments:

| Name | Type | Description |
|------------------|--------|--|
| <i>string-1</i> | text | Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~). |
| <i>string-2</i> | text | |
| <i>start-pos</i> | number | The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first character is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0. |

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example:

SEARCH("de", "abcdeF") results in 4

SEARCH("?c*e", "abcdeF") results in 2

end example]

18.17.7.286 SEARCHB

Syntax:

SEARCHB (*string-1* , *string-2* [, *start-pos*])

Description: Performs a case-insensitive search, using a lexical comparison, for the first occurrence of *string-1* in *string-2*, starting at byte position *start-pos* within *string-2*. (SEARCHB is intended for use with languages that use the double-byte character set (DBCS), whereas SEARCH (§18.17.7.285) is intended for use with languages that use the single-byte character set (SBCS).)

Arguments:

| Name | Type | Description |
|------------------|--------|--|
| <i>string-1</i> | text | Designate the string to be searched for within the string designated by <i>string-2</i> . <i>string-1</i> can contain the following wildcard characters: question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for an actual question mark or asterisk, that character shall be preceded by a tilde (~). |
| <i>string-2</i> | text | |
| <i>start-pos</i> | number | The number of the start position within <i>string-2</i> for which <i>string-1</i> is to be searched. The start position of the first byte is 1. If omitted, a position of 1 shall be assumed. <i>start-pos</i> shall be at least 0. |

Return Type and Value: number – The start position of the first occurrence of *string-1* in *string-2*, starting at character position *start-pos* within *string-2*. If *string-1* is an empty string, it shall always be found in any *string-2* at position *start-pos*, or at position 1 if *start-pos* is omitted.

However, if

- *string-1* is not found within *string-2*, #VALUE! is returned.
- *start-pos* designates a position outside *string-2*, #VALUE! is returned.

[Example: Assuming 1-byte characters

SEARCHB("de", "abcdeF") results in 4

SEARCHB("?c*e", "abcdeF") results in 2

end example]

18.17.7.287 SECOND

Syntax:

SECOND (*time-value*)

Description: Computes the second for the date and/or time having the given *time-value*.

Arguments:

| Name | Type | Description |
|-------------------|--------|--|
| <i>time-value</i> | number | The date and/or time whose second is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its integer part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any date information shall be ignored. |

Return Type and Value: number – The second for the date and/or time having the given *time-value*.

However, if *time-value* is out of range for the current date base value, #NUM! is returned.

[Example:

SECOND(DATE(2006,2,26)+TIME(2,10,20)) results in 20

SECOND(TIME(22,56,34)) results in 34

SECOND(0) results in 0, since serial value 0 represents 00:00:00

SECOND(10.5) results in 0, since serial value .5 represents 12:00:00

SECOND("22-Oct-2001 10:53:12") results in 12

SECOND("10:53:12 pm") results in 12

SECOND("22:53:12") results in 12

end example]

18.17.7.288 SERIESSUM

Syntax:

SERIESSUM (*input-value* , *initial-power* , *step* , *coefficients*)

Description: Computes the sum of a power series.

Mathematical Formula:

The sum of a power series is based on the formula:

$$SERIES(x, n, m, a) = a_1 x^n + a_2 x^{(n+m)} + a_3 x^{(n+2m)} + \dots + a_i x^{(n+(i-1)m)}$$

where:

- a = argument *coefficients*
- m = argument *step*
- n = argument *initial-power*

- x = argument *input-value*

Arguments:

| Name | Type | Description |
|----------------------|-----------|---|
| <i>input-value</i> | number | The input value to the power series; |
| <i>initial-power</i> | number | The initial power to which <i>input-value</i> is to be raised. |
| <i>step</i> | number | The step by which to increase <i>initial-power</i> for each term in the series; |
| <i>coefficients</i> | reference | A set of coefficients by which each successive power of <i>input-value</i> is multiplied. The number of values in <i>coefficients</i> determines the number of terms in the power series. |

Return Type and Value: number – The sum of a power series.

[Example: Given the following data:

| | A |
|---|-------------|
| 1 | 1 |
| 2 | =-1/FACT(2) |
| 3 | =1/FACT(4) |
| 4 | =-1/FACT(6) |

SERIESSUM(PI()/4,0,2,A1:A4) results in 0.707103, an approximation to the cosine of $\pi/4$ radians

end example]

18.17.7.289 SIGN

Syntax:

SIGN (x)

Description: Determines the sign of x .

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The number whose sign is to be determined. |

Return Type and Value: number – 1 if x is positive, 0 if x is 0, and -1 if x is negative.

[Example:

SIGN(10.5) results in 1

SIGN(0) results in 0

SIGN(-5.4) results in -1

end example]

18.17.7.290 SIN

Syntax:

SIN (x)

Description: Computes the sine of x .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The number, in radians, whose sine is to be computed. |

Return Type and Value: number – The sine of x .

[Example:

SIN(-1) results in -0.841470985

SIN(0) results in 0

SIN(1) results in 0.841470985

end example]

18.17.7.291 SINH

Syntax:

SINH (x)

Description: Computes the hyperbolic sine of x .

Arguments:

| Name | Type | Description |
|------|--------|---|
| x | number | The number whose hyperbolic sine is to be computed. |

Return Type and Value: number – The hyperbolic sine of x .

However, if the magnitude of x is too large for the result to be represented, #NUM! is returned.

[*Example:*

SINH(1) results in 1.175201194

SINH(10) results in 11013.23287

SINH(100) results in 1.34406E+43

end example]

18.17.7.292 SKEW

Syntax:

SKEW (*argument-list*)

Description: Computes the skewness of a distribution. [*Note:* Skewness characterizes the degree of asymmetry of a distribution around its mean. Positive skewness indicates a distribution with an asymmetric tail extending toward more positive values. Negative skewness indicates a distribution with an asymmetric tail extending toward more negative values. *end note*]

Mathematical Formula:

$$\frac{n}{(n-1)(n-2)} \sum \left(\frac{x_i - \bar{x}}{s} \right)^3$$

where:

- n = the number of elements in *argument-list*
- s = standard deviation of the values in *argument-list*
- x_i = value of each element in *argument-list*
- \bar{x} = mean of the values in *argument-list*

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers for which the skewness is to be computed. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The skewness of a distribution.

However, if

- There are fewer than three data points, the return value is unspecified.
- The sample standard deviation is zero, the return value is unspecified.

[Example:

SKEW(3,4,5,2,3,4,5,6,4,7) results in 0.359543071

end example]

18.17.7.293 SLN

SLN (*cost* , *salvage* , *life*)

Description: Computes the straight-line depreciation of an asset for one period.

Arguments:

| Name | Type | Description |
|----------------|--------|---|
| <i>cost</i> | number | The number <i>cost</i> is the initial cost of the asset. |
| <i>salvage</i> | number | The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) |
| <i>life</i> | number | The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.) |

Return Type and Value: number – The straight-line depreciation of an asset for one period.

[Example:

SLN(30000,7500,10) results in 2,250.00

end example]

18.17.7.294 SLOPE

Syntax:

SLOPE (*known-ys* , *known-xs*)

Description: Computes the slope of the linear regression line through data points in known ys and known xs. The slope is the vertical distance divided by the horizontal distance between any two points on the line, which is the rate of change along the regression line.

Mathematical Formula:

$$b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$$

where:

- x = a sample value
- \bar{x} = the sample mean `AVERAGE(known-xs)`
- y = a sample value
- \bar{y} = the sample mean `AVERAGE(known-ys)`

Arguments:

| Name | Type | Description |
|-----------------|--|---|
| <i>known-xs</i> | number, name, array, or reference to number, text, logical | Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>known-ys</i> | number, name, array, or reference to number, text, logical | Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The slope of the linear regression line through data points in known ys and known xs.

However, if

- *known-ys* and *known-xs* are empty, the return value is unspecified.
- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.

[Example:

`SLOPE({2,3,9,1,8,7,5},{6,5,11,7,5,4,4})` results in 0.305555556

end example]

18.17.7.295 SMALL

Syntax:

`SMALL (array , k)`

Description: Computes the k^{th} smallest value in a data set.

Arguments:

| Name | Type | Description |
|--------------|------------------|--|
| <i>array</i> | array, reference | The set of numbers from which the k^{th} -smallest value is to be determined. |
| <i>k</i> | number | The position (from the smallest) in the array or cell range of data to return. |

Return Type and Value: number – The k^{th} smallest value in a data set.

However, if

- *array* is empty, the return value is unspecified.
- $k \leq 0$ or k is greater than the number of data points, #NUM! is returned.

[Example:

SMALL({3,5,3,5,4;4,2,4,6,7},3) results in 3

SMALL({3,5,3,5,4;4,2,4,6,7},7) results in 5

end example]

18.17.7.296 SQRT

Syntax:

SQRT (*x*)

Description: Computes the positive square root of *x*.

Arguments:

| Name | Type | Description |
|----------|--------|--|
| <i>x</i> | number | The number whose positive root is to be found. |

Return Type and Value: number – The positive square root of *x*.

However, if *x* is negative, #NUM! is returned.

[Example:

SQRT(2) results in 1.414213562

SQRT(5) results in 2.236067977

end example]

18.17.7.297 SQRTPI

Syntax:

SQRTPI (x)

Description: Computes the positive square root of $x \times \pi$.

Arguments:

| Name | Type | Description |
|------|--------|--|
| x | number | The number, which when multiplied by π , whose positive root is to be found. |

Return Type and Value: number – The positive square root of $x \times \pi$.

However, if x is negative, #NUM! is returned.

[*Example:*

SQRTPI(1) results in 1.772453851

SQRTPI(2) results in 2.506628275

end example]

18.17.7.298 STANDARDIZE

Syntax:

STANDARDIZE (x , *mean* , *standard-dev*)

Description: Computes a normalized value from a distribution characterized by *mean* and *standard-dev*.

Mathematical Formula:

$$Z = \frac{X - \mu}{\sigma}$$

where:

- X = argument x
- μ = argument *mean*
- σ = argument *standard-dev*

Arguments:

| Name | Type | Description |
|---------------------|--------|---|
| x | number | The number whose value is to be normalized. Represented by X in the mathematical formula presented. |
| <i>mean</i> | number | The arithmetic mean of the distribution. Represented by μ (μ) in the mathematical formula presented. |
| <i>standard-dev</i> | number | The standard deviation of the distribution. Represented by σ (σ) in the mathematical formula presented. |

Return Type and Value: number – A normalized value from a distribution.

However, if *standard-dev* ≤ 0 , #NUM! is returned.

[Example:

STANDARDIZE(42,40,1.5) results in 1.333333333

end example]

18.17.7.299 STDEV

Syntax:

STDEV (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEV assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVA instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{(n - 1)}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. <i>argument-list</i> can also be an array of numbers. Logical values and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored. |

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[Example:

STDEV(123,134,143,173,112,109) results in 23.72902583

end example]

18.17.7.300 STDEVA

Syntax:

STDEVA (*argument-list*)

Description: Makes an estimate of the standard deviation based on a sample, using the "unbiased" or "n-1" method. [Note: STDEVA assumes that its arguments are a sample of the population. If the data represents the entire population, STDEVP should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEV instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{(n - 1)}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|------------------|--|
| <i>argument-list</i> | logical, number, | The <i>arguments</i> in <i>argument-list</i> designate the numbers |

| Name | Type | Description |
|------|--|--|
| | name, text, array, reference. The argument list can also be an array of numbers. | that are samples of the population. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored. |

Return Type and Value: number – An estimate of the standard deviation based on a sample.

[Example:

STDEVA(123,134,143,173,112,109) results in 23.72902583

end example]

18.17.7.301 STDEVP

Syntax:

STDEVP (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVP assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use STDEVPA instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|--|---|
| <i>argument-list</i> | logical, number, name, text, array, reference. | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered |

| Name | Type | Description |
|------|--|--|
| | The argument list can also be an array of numbers. | directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored. |

Return Type and Value: number – The standard deviation of an entire population.

[Example:

STDEVP(123,134,143,173,112,109) results in 21.66153785

end example]

18.17.7.302 STDEVPA

Syntax:

STDEVPA (*argument-list*)

Description: Computes the standard deviation of an entire population, using the "biased" or "n" method. [Note: STDEVPA assumes that its arguments are the total population. If the data represents a population sample only, STDEVA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use STDEVP instead. end note]

Mathematical Formula:

$$\sqrt{\frac{\sum(x - \bar{x})^2}{n}}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-2*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, text, array, reference. The argument list can also be an | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. |

| Name | Type | Description |
|------|-------------------|-------------|
| | array of numbers. | |

Return Type and Value: number – The standard deviation of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

STDEVPA(123,134,143,173,112,109) results in 21.66153785

end example]

18.17.7.303 STEYX

Syntax:

STEYX (*known-ys* , *known-xs*)

Description: Computes the standard error of the predicted *y*-value for each *x* in the regression. The standard error is a measure of the amount of error in the prediction of *y* for an individual *x*.

Mathematical Formula:

$$\sqrt{\frac{1}{(n-2)} \left[\sum (y - \bar{y})^2 - \frac{[\sum (x - \bar{x})(y - \bar{y})]^2}{\sum (x - \bar{x})^2} \right]}$$

where:

- *x* = a sample value
- \bar{x} = the sample mean AVERAGE(*known-xs*)
- *y* = a sample value
- \bar{y} = the sample mean AVERAGE(*known-ys*)

Arguments:

| Name | Type | Description |
|-----------------|--------------------------------------|---|
| <i>known-xs</i> | number, name, array, or reference to | Designate a set of numeric dependent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If |

| Name | Type | Description |
|-----------------|--|---|
| | number, text, logical | an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |
| <i>known-ys</i> | number, name, array, or reference to number, text, logical | Designate a set of numeric independent data points. Logical values and text representations of numbers entered directly into the list of arguments are included. If an array or reference argument contains text, logical values, or empty cells, those values are ignored; however, cells with the value 0 are included. |

Return Type and Value: number – The standard error of the predicted y-value for each x in the regression.

However, if

- *known-ys* and *known-xs* have a different number of data points, the return value is unspecified.
- *known-ys* and *known-xs* are empty or have less than three data points, the return value is unspecified.

[Example:

STEYX({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 3.30571895

end example]

18.17.7.304 SUBSTITUTE

Syntax:

SUBSTITUTE (*string* , *old-string* , *new-string* [, *occurrence*])

Description: Produces a new string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

Arguments:

| Name | Type | Description |
|-------------------|--------|--|
| <i>string</i> | text | Designates a string. |
| <i>old-string</i> | text | Designates a string. |
| <i>new string</i> | text | Designates a string. |
| <i>occurrence</i> | number | The occurrence number of the <i>old-string</i> characters within <i>string-1</i> that is to be replaced by the string designated by <i>new-string</i> . If omitted, all occurrences of <i>old-string</i> characters shall be replaced. |

Return Type and Value: text – A string that is *string* with one or all occurrences of *old-string* replaced by *new-string*.

However, if *occurrence* < 0, #VALUE! is returned.

[Example:

SUBSTITUTE("abcaaabca", "a", "xx") results in xxbcxxxxxxbcxx

SUBSTITUTE("abcaaabca", "a", "", 10) results in bcbc

SUBSTITUTE("abcaaabca", "a", "xx", 3) results in abcaxxabca

end example]

18.17.7.305 SUBTOTAL

Syntax:

SUBTOTAL (*function-number* , *argument-list*)

Description: Computes a value using the function designated by *function-number*, using the *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|------------------------|--------|--|
| <i>function-number</i> | number | Indicates the function to be called, as shown in the table below. |
| <i>argument-list</i> | number | Each <i>argument</i> in <i>argument-list</i> is passed to the called function, in the order specified. That shall be no more than 254 <i>arguments</i> . |

| <i>function-number</i> (includes hidden values) | <i>function-number</i> (excludes hidden values) | Function |
|--|--|----------|
| 1 | 101 | AVERAGE |
| 2 | 102 | COUNT |
| 3 | 103 | COUNTA |
| 4 | 104 | MAX |
| 5 | 105 | MIN |
| 6 | 106 | PRODUCT |
| 7 | 107 | STDEV |
| 8 | 108 | STDEVP |
| 9 | 109 | SUM |

| <i>function-number</i> (includes hidden values) | <i>function-number</i> (excludes hidden values) | Function |
|--|--|----------|
| 10 | 110 | VAR |
| 11 | 111 | VARP |

If any argument contains a SUBTOTAL function call, that call shall be ignored to avoid double counting.

For the *function-number* values 1–11, the values of hidden rows are included. For the *function-number* values 101–111, the values of hidden rows are excluded.

The SUBTOTAL function shall ignore any rows that are not included in the result of a filter, regardless of which *function-number* value is used.

The SUBTOTAL function is designed for columns of data, or vertical ranges. It is not designed for rows of data, or horizontal ranges. [Example: When a horizontal range is subtotaled using a *function-number* of 101 or greater, hiding a column does not affect the subtotal. However, hiding a row in a subtotal of a vertical range does affect the subtotal. end example]

Return Type and Value: number – The result from calling the function designated by *function-number*, using the *arguments* in *argument-list*.

However, if *function-number* does not have one of the values specified above, #NUM! is returned.

[Example:

SUBTOTAL (2, E5:E15) counts the number of values in the cell range E5:E15, including hidden values

SUBTOTAL (4, E5:E15) finds the maximum value of the values in the cell range E5: E15, including hidden values

SUBTOTAL (106, E5:E15) finds the product of the values in the cell range E5: E15, excluding hidden values

end example]

18.17.7.306 SUM

Syntax:

SUM (*argument-list*)

Description: Adds the numeric values of *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|--|--|
| <i>argument-list</i> | logical, number, name, text, array, reference. | The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be added. Arguments that are numbers, logical values, or text representations of numbers shall be |

| Name | Type | Description |
|------|------|---|
| | | counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored. |

Return Type and Value: number – The sum of the values of its arguments.

[Example:

SUM(1,2,3,4,5) results in 15

SUM({1,2;3,4}) results in 10

SUM({1,2,3,4,5},6,"7") results in 28

SUM({1,"2",TRUE,4}) results in 5, as the logical value and numeric text are ignored

end example]

18.17.7.307 SUMIF

Syntax:

SUMIF (*cell-range* , *selection-criteria* [, *sum-range*])

Description: Applies selection criteria on the values in one range of cells and sums the values of the cells in a corresponding range.

Arguments:

| Name | Type | Description |
|---------------------------|-------------------------------------|---|
| <i>cell-range</i> | reference | Designates the range of cells to be inspected. |
| <i>selection-criteria</i> | number, expression, reference, text | Defines which cells are counted. In the case of text, <i>selection-criteria</i> can consist of any comparison operator followed by the operand against which each cell's value is to be compared. <i>selection-criteria</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). |
| <i>sum-range</i> | reference | If present, <i>sum-range</i> designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range</i> . If |

| Name | Type | Description |
|------|------|---|
| | | omitted, <i>cell-range</i> also designates the cells whose values are summed. |

Return Type and Value: number – The sum of the cells corresponding to those selected.

[Example: Given that A1, B1, C1, and D1, respectively, contain the values 3, 10, 7, and 10

SUMIF(A1:D1, "=10") results in 20

SUMIF(A1:D1, ">5") results in 27

SUMIF(A1:D1, "<>10") results in 10

Given that A2, B2, C2, and D2, respectively, contain the values apples, melons, 10, and 15

SUMIF(A2:B2, "*es", C2:D2) results in 10

end example]

18.17.7.308 SUMIFS

Syntax:

SUMIFS (*sum-range* , *cell-range-1* , *selection-criteria-1*
[, *cell-range-2* , *selection-criteria-2* [, ...]])

Description: Adds the cells in a range that meet multiple criteria.

Arguments:

| Name | Type | Description |
|-----------------------------|-------------------------------------|--|
| <i>sum-range</i> | reference | Designates the cells whose values are summed. In this case, <i>sum-range</i> does not have to have the same size and shape as <i>cell-range-1</i> through <i>cell-range-n</i> . The actual cells that are added are determined by using the top, left cell in <i>sum-range</i> as the beginning cell, and then including cells that correspond in size and shape to <i>cell-range-1</i> through <i>cell-range-n</i> . Each cell in <i>sum-range</i> is summed only if all of the corresponding criteria specified are true for that cell. Cells in <i>sum-range</i> that contain TRUE evaluate to 1; cells in <i>sum-range</i> that contain FALSE evaluate to 0. |
| <i>cell-range-1</i> | reference | Designates the first range of cells to be inspected. |
| <i>selection-criteria-1</i> | number, expression, reference, text | Specifies the criteria for the first range of cells that is counted. In the case of text, <i>selection-criteria-1</i> can consist of any comparison operator followed by the operand against which each cell's value is to be |

| Name | Type | Description |
|-----------------------------|-------------------------------------|---|
| | | compared. <i>selection-criteria-1</i> can include one or more wildcard characters, question mark (?) and asterisk (*). A question mark matches any single character; an asterisk matches any sequence of characters. To search for a question mark, asterisk, or tilde character, prefix that character with a tilde (~). |
| <i>cell-range-n</i> | reference | The optional arguments <i>selection-criteria-2</i> through <i>selection-criteria-n</i> have corresponding arguments <i>cell-range-2</i> through <i>cell-range-n</i> , and have the same semantics as <i>selection-criteria-1</i> and <i>cell-range-1</i> , respectively. |
| <i>selection-criteria-n</i> | number, expression, reference, text | |

Return Type and Value: number – The sum of the cells corresponding to those selected.

[Example: Given the following data:

| | A | B | C | D |
|---|--------------|--------|--------|-------|
| 1 | Sales Person | Tables | Chairs | Desks |
| 2 | Emilio | 34 | 85 | 97 |
| 3 | Julie | 353 | 23 | 18 |
| 4 | Hans | 13 | 67 | 14 |
| 5 | Frederique | 0 | 98 | 0 |

SUMIFS(B2:C5,A2:A5,"=Julie") results in 353 (the sum of the number of tables and chairs sold by Julie)

SUMIFS(B2:B5,A2:A5,"=Julie",A2:A5,"=Hans") results in 0 (the sum of the number of tables sold by Julie and Hans)

SUMIFS(B2:B5,A3,"=Julie",A4,"=Hans") results in 34 (the sum of the the number of tables sold by Julie and Hans)

SUMIFS(B2:D5,A2:A5,"<>Emilio") results in 768 (the sum of the number of tables, chairs, and desks sold by all sales persons except Emilio)

end example]

18.17.7.309 SUMPRODUCT

Syntax:

SUMPRODUCT (*argument-list*)

Description: Multiplies the corresponding elements in the array *arguments* in *argument-list*, and returns the sum of those products. An array element that is not numeric is treated as if it contained 0.

Arguments:

| Name | Type | Description |
|----------------------|------------------|---|
| <i>argument-list</i> | array of numbers | The <i>arguments</i> in <i>argument-list</i> designate the numeric values to be multiplied. |

Return Type and Value: number – The sum of the products of the corresponding elements in the *arguments* in *argument-list*.

However, if the array arguments do not have the same dimensions, #NUM! is returned.

[Example:

SUMPRODUCT({2,3}) results in 5

SUMPRODUCT({2,3},{4,5}) results in 23

SUMPRODUCT({2,3},{4,5},{2,2}) results in 46

SUMPRODUCT({2,3;4,5},{2,2;3,4}) results in 42

end example]

18.17.7.310 SUMSQ

Syntax:

SUMSQ (*argument-list*)

Description: Adds the squares of *arguments* in *argument-list*.

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the values whose squares are to be summed. Arguments that are numbers, logical values, or text representations of numbers shall be counted. If an argument is an array or reference, only numbers in that array or reference shall be counted. Empty cells, logical values, and text in the array or reference shall be ignored. |

Return Type and Value: number – The sum of the squares of its arguments.

[Example:

SUMSQ(2) results in 4
SUMSQ(2.5, -3.6)) results in 19.21
SUMSQ({2.5, -3.6}), 2.4) results in 24.97

end example]

18.17.7.311 SUMX2MY2

Syntax:

SUMX2MY2 (array-1 , array-2)

Description: Computes the sum of the difference of squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2MY2 = \sum (x^2 - y^2)$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

| Name | Type | Description |
|----------------|------------------|--|
| <i>array-1</i> | array, reference | Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included. |
| <i>array-2</i> | | |

Return Type and Value: number – The sum of the difference of squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2MY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 55
SUMX2MY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in -64
end example]

18.17.7.312 SUMX2PY2

Syntax:

SUMX2PY2 (*array-1* , *array-2*)

Description: Computes the sum of the sum of the squares of the corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMX2PY2 = \sum (x^2 + y^2)$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

| Name | Type | Description |
|----------------|------------------|--|
| <i>array-1</i> | array, reference | Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included. |
| <i>array-2</i> | | |

Return Type and Value: number – The sum of the sum of the squares of the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMX2PY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 521

SUMX2PY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 480

end example]

18.17.7.313 SUMXMY2

Syntax:

SUMXMY2 (*array-1* , *array-2*)

Description: Computes the sum of the squares of the difference between corresponding numerical elements in two arrays designated by *array-1* and *array-2*.

Mathematical Formula:

$$SUMXMY2 = \sum (x - y)^2$$

where:

- *array-1* contains the *x* values
- *array-2* contains the *y* values

Arguments:

| Name | Type | Description |
|----------------|------------------|--|
| <i>array-1</i> | array, reference | Designated the arrays to be operated on. If an argument contains text, logical values, or empty cells, those elements shall be ignored; however, cells with the value 0 shall be included. |
| <i>array-2</i> | | |

Return Type and Value: number – The sum of the squares of the difference between the corresponding elements in two arrays designated by *array-1* and *array-2*.

However, if *array-1* and *array-2* have a different number of values, the return value is unspecified.

[Example:

SUMXMY2({2,3,9,1,8,7,5},{6,5,11,7,5,4,4}) results in 79

SUMXMY2({2,3,9;1,8,7},{6,5,11;7,5,4}) results in 78

end example]

18.17.7.314 SYD

SYD (*cost* , *salvage* , *life* , *per*)

Description: Computes the sum-of-years' digits depreciation of an asset for a specified period.

Mathematical Formula:

$$SYD = \frac{(cost - salvage) * (life - per + 1) * 2}{(life)(life + 1)}$$

where:

- *cost* = argument *cost*
- *life* = argument *life*
- *per* = argument *per*
- *salvage* = argument *salvage*

Arguments:

| Name | Type | Description |
|----------------|--------|---|
| <i>cost</i> | number | The initial cost of the asset. |
| <i>salvage</i> | number | The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) |
| <i>life</i> | number | The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.) |
| <i>per</i> | number | The period and shall have the same units as <i>life</i> . |

Return Type and Value: number – The sum-of-years' digits depreciation of an asset for a specified period.

[Example:

SYD(30000,7500,10,1) results in 4,090.91

SYD(30000,7500,10,10) results in 409.09

end example]

18.17.7.315 T

Syntax:

T (*value*)

Description: Retrieves the text referenced by *value*.

Arguments:

| Name | Type | Description |
|--------------|------|---|
| <i>value</i> | any | The value to be tested for text. No conversion to text shall take place on an argument passed to this function. |

Return Type and Value: text – *value* if *value* designates text; otherwise, "". [Note: T cannot differentiate between text that is an empty string, and any *value* of non-text type. end note]

[Example:

T("Hello") results in Hello

T(123) results in an empty string

LEN(T(123)) results in 0

*end example]***18.17.7.316 TAN****Syntax:**TAN (x)**Description:** Computes the tangent of x .**Arguments:**

| Name | Type | Description |
|------|--------|--|
| x | number | The number, in radians, whose tangent is to be computed. |

Return Type and Value: number – The tangent of x .*[Example:*

TAN(-1) results in -1.557407725

TAN(0) results in 0

TAN(1) results in 1.557407725

*end example]***18.17.7.317 TANH****Syntax:**TANH (x)**Description:** Computes the hyperbolic tangent of x .**Arguments:**

| Name | Type | Description |
|------|--------|--|
| x | number | The number whose hyperbolic tangent is to be computed. |

Return Type and Value: number – The hyperbolic tangent of x *[Example:*

TANH(-1) results in -0.761594156

TANH(0) results in 0

TANH(1) results in 0.761594156

end example]

18.17.7.318 TBILLEQ

TBILLEQ (*settlement* , *maturity* , *discount*)

Description: Computes the bond-equivalent yield for a U.S. Treasury bill.

Arguments:

| Name | Type | Description |
|-------------------|--------|---|
| <i>settlement</i> | number | The Treasury bill's settlement date. Any time information in the date is ignored. |
| <i>maturity</i> | number | The Treasury bill's maturity date. Any time information in the date is ignored. |
| <i>discount</i> | number | The Treasury bill's discount rate. |

Return Type and Value: number – The bond-equivalent yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *discount* ≤ 0, #NUM! is returned.

[Example:

TBILLEQ(DATE(2008,3,31),DATE(2008,6,1),0.0914) results in 9.4151%

end example]

18.17.7.319 TBILLPRICE

TBILLPRICE (*settlement* , *maturity* , *discount*)

Description: Computes the price per \$100 face value for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLPRICE = 100 \times \left(1 - \frac{discount \times DSM}{360} \right)$$

where:

- *discount* = argument *discount*
- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.

Arguments:

| Name | Type | Description |
|-------------------|--------|---|
| <i>settlement</i> | number | The Treasury bill's settlement date. Any time information in the date is ignored. |
| <i>maturity</i> | number | The Treasury bill's maturity date. Any time information in the date is ignored. |
| <i>discount</i> | number | The Treasury bill's discount rate. |

Return Type and Value: number – The price per \$100 face value for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- *discount* ≤ 0, #NUM! is returned.

[Example:

TBILLPRICE (DATE (2008, 3, 31), DATE (2008, 6, 1), 0.09) results in 98.4500

end example]

18.17.7.320 TBILLYIELD

TBILLYIELD (*settlement* , *maturity* , *pr*)

Description: Computes the yield for a U.S. Treasury bill.

Mathematical Formula:

$$TBILLYIELD = \frac{100 - pr.}{pr.} \times \frac{360}{DSM}$$

where:

- *DSM* = number of days from settlement to maturity, excluding any maturity date that is more than one calendar year after the settlement date.
- *pr.* = argument *pr*

Arguments:

| Name | Type | Description |
|-------------------|--------|---|
| <i>settlement</i> | number | The Treasury bill's settlement date. Any time information in the date is ignored. |
| <i>maturity</i> | number | The Treasury bill's maturity date. Any time information in the date is ignored. |
| <i>pr</i> | number | The Treasury bill's price per \$100 face value. |

Return Type and Value: number – The yield for a U.S. Treasury bill.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* > *maturity*, #NUM! is returned.
- *maturity* is more than one year after *settlement*, #NUM! is returned.
- $pr \leq 0$, #NUM! is returned.

[Example:

TBILLYIELD(DATE(2008,3,31),DATE(2008,6,1),98.45) results in 9.1417%

end example]

18.17.7.321 TDIST

Syntax:

TDIST (*x* , *degrees-freedom* , *distribution-tails*)

Description: Computes the Percentage Points (probability) for the Student t-distribution where a numeric value, *x*, is a calculated value of *t* for which the Percentage Points are to be computed.

Mathematical Formula:

If *distribution-tails* = 1, $TDIST = P(X > x)$, where *X* is a random variable that follows the t-distribution.

If *distribution-tails* = 2, $TDIST = P(|X| > x) = P(X > x \text{ or } X < -x)$

Arguments:

| Name | Type | Description |
|---------------------------|--------|---|
| <i>x</i> | number | The value at which to evaluate the distribution. |
| <i>degrees-freedom</i> | number | The number of degrees of freedom, truncated to an integer. |
| <i>distribution-tails</i> | number | The number of distribution tails to return, truncated to an integer. If 1, TDIST returns the one-tailed distribution. |

| Name | Type | Description |
|------|------|--|
| | | If 2, TDIST returns the two-tailed distribution. |

Return Type and Value: number – The Percentage Points (probability) for the Student t-distribution.

However, if

- *degrees-freedom* < 1, #NUM! is returned.
- *tails* has any value other than 1 or 2, #NUM! is returned.
- $x < 0$, #NUM! is returned.

[Example:

TDIST(1.959999998,60,1) results in 0.027322464

TDIST(1.959999998,60,2) results in 0.054644927

end example]

18.17.7.322 TEXT

Syntax:

TEXT (*value* , *format*)

Description: Produces a string containing *value* formatted according to *format*.

Arguments:

| Name | Type | Description |
|---------------|--------|--|
| <i>value</i> | number | The number that is to be formatted. |
| <i>format</i> | text | Designates the number, currency, date, or time format to be used. (See §18.8.31 for the set of formats.) |

Return Type and Value: text – The string containing *number* formatted according to *format*.

[Example:

TEXT(1234.567,"\$0.00") results in \$1234.57

TEXT(.125,"\$0.0%") results in 12.5%

TEXT(1234.567,"YYYY-MM-DD HH:MM:SS") results in 1903-05-18 13:36:29 in the 1900 date-base system.

end example]

18.17.7.323 TIME

Syntax:

TIME (*hour* , *minute* , *second*)

Description: Computes the serial value for the given time.

Arguments:

| Name | Type | Description |
|---------------|--------|--|
| <i>hour</i> | number | A number in the range 0–32767, inclusive, truncated to integer, that represents the hour. Any value greater than 23 shall be divided by 24 and the remainder shall be treated as the hour value. |
| <i>minute</i> | number | A number in the range 0–32767, inclusive, truncated to integer, that represents the minute. Any value greater than 59 shall be converted to the corresponding number of hours and minutes. |
| <i>second</i> | number | A number in the range 0–32767, inclusive, truncated to integer, that represents the second. Any value greater than 59 shall be converted to the corresponding number of hours, minutes, and seconds. |

Return Type and Value: number – The serial value for the given time, as a value greater than or equal to 0 and less than or equal to 1.

However, if *hour*, *minute*, or *second* are out of range, #NUM! is returned.

[Example: The following serial values are displayed with 16 decimal places.

TIME(0,0,0) results in a serial value of 0.0000000000000000

TIME(0,0,1) results in a serial value of 0.0000115740740741

TIME(0,0,2) results in a serial value of 0.0000231481481481

TIME(0,0,20) results in a serial value of 0.0002314814814815

TIME(2,3,20) results in a serial value of 0.0856481481481481

TIME(12,0,0) results in a serial value of 0.5000000000000000

TIME(23,59,59) results in a serial value of 0.9999884259259260

TIME(26,120,240) results in a serial value of 0.1694444444444450

end example]

18.17.7.324 TIMEVALUE

Syntax:

TIMEVALUE (*date-time-string*)

Description: Computes the serial value of the time represented by the string *date-time-string*.

Arguments:

| Name | Type | Description |
|-------------------------|------|---|
| <i>date-time-string</i> | text | The date and/or time whose time component serial value is to be computed. <i>date-time-string</i> can have any date and/or time format. Any date information in <i>date-time-string</i> shall be ignored. |

Return Type and Value: number – The serial value of the time represented by the string *date-time-string*, as a value greater than or equal to 0 and less than or equal to 1.

However, if *date-time-string* is ill-formed, #VALUE! is returned.

[Example: The following serial values are displayed with 16 decimal places.

TIMEVALUE("10:02:34 ") results in 0.4184490740740740

TIMEVALUE("01-Feb-2006 10:15:29 AM") results in 0.4274189814823330

TIMEVALUE("22:02") results in 0.9180555555555560

end example]

18.17.7.325 TINV

Syntax:

TINV (*probability* , *degrees-freedom*)

Description: Computes the t-value of the Student's t-distribution as a function of the probability and the degrees of freedom.

Arguments:

| Name | Type | Description |
|------------------------|--------|--|
| <i>probability</i> | number | A probability associated with the two-tailed Student's t-distribution. |
| <i>degrees-freedom</i> | number | The number of degrees of freedom with which to characterize the distribution, truncated to an integer. |

Return Type and Value: number – The t-value of the Student's t-distribution.

However, if

- *probability* < 0 or *probability* > 1, #NUM! is returned.
- *degrees-freedom* < 1, #NUM! is returned.

[Example:

TINV(0.054644927,60) results in 1.95999999

end example]

18.17.7.326 TODAY

Syntax:

TODAY ()

Description: Computes the serial value of the current date, taking into account the current date base value.

Arguments: None.

Return Type and Value: number – The serial value of the current date.

[Example:

On February 25, 2006, TODAY() results in 38773 for the 1900 date base system, or 37311 for the 1904 date base system

end example]

18.17.7.327 TRANSPOSE

Syntax:

TRANSPOSE (*array*)

Description: Creates a new array that is the transpose of an existing array, by copying the first row of the existing array to the first column of the new array, the second row of the existing array as the second column of the new array, and so on. The formula containing the call to TRANSPOSE shall be an array formula in a range that has the same number of rows and columns, respectively, as *array* has columns and rows.

Arguments:

| Name | Type | Description |
|--------------|------------------|-------------------------------------|
| <i>array</i> | array, reference | The set of values to be transposed. |

Return Type and Value: array – The new array.

[Example:

TRANSPOSE({10,20,30}) results in the array {10;20;30}

end example]

18.17.7.328 TREND

Syntax:

TREND (*known-ys* [, [*known-xs*] [, [*new-xs*] [, *const-flag*]])

Description: Computes values along a linear trend. Fits a straight line (using the method of least squares) to the arrays *known-ys* and *known-xs*. The y-values along that line for the array of *new-xs* specified.

Arguments:

| Name | Type | Description |
|-------------------|---------|--|
| <i>known-ys</i> | array | The set of y-values already known in the relationship $y=mx+b$. If that array is in a single column, each column of <i>known-xs</i> is interpreted as a separate variable. If that array is in a single row, each row of <i>known-xs</i> is interpreted as a separate variable. |
| <i>known-xs</i> | array | An optional set of x-values that might already be known in the relationship $y=mx+b$. The array <i>known-xs</i> can include one or more sets of variables. If only one variable is used, <i>known-ys</i> and <i>known-xs</i> can be ranges of any shape, as long as they have equal dimensions. If more than one variable is used, <i>known-ys</i> shall be a vector. If <i>known-xs</i> is omitted, it is assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> . |
| <i>new-xs</i> | array | New x-values for which TREND is to return corresponding y-values. <i>new-xs</i> shall include a column (or row) for each independent variable, just as <i>known-xs</i> does. So, if <i>known-ys</i> is in a single column, <i>known-xs</i> and <i>new-xs</i> shall have the same number of columns. If <i>known-ys</i> is in a single row, <i>known-xs</i> and <i>new-xs</i> shall have the same number of rows. If <i>new-xs</i> is omitted, it is assumed to be the same as <i>known-xs</i> . If both <i>known-xs</i> and <i>new-xs</i> are omitted, they are assumed to be the array {1,2,3,...} that is the same size as <i>known-ys</i> . |
| <i>const-flag</i> | logical | Specifies whether to force the constant b to equal 0. If TRUE or omitted, b is calculated normally. If FALSE, b is set equal to 0 and the m -values are adjusted so that $y=mx$. |

Return Type and Value: array – The values along a linear trend, as an array of numbers.

18.17.7.329 TRIM

Syntax:

TRIM (*string*)

Description: Makes a string that is a copy of *string* with the leading and trailing space characters removed, and each sequence of embedded spaces reduced to a single space. The space character referred to here is character U+0020.

Arguments:

| Name | Type | Description |
|---------------|------|--------------------------------------|
| <i>string</i> | text | Designates the string to be trimmed. |

Return Type and Value: text – The trimmed copy of *string*.

[Example:

TRIM(" abc def ") results in abc def

end example]

18.17.7.330 TRIMMEAN

Syntax:

TRIMMEAN (*array* , *percent*)

Description: Computes the mean of the interior of a data set by excluding a percentage of data points from the top and bottom tails of a data set. TRIMMEAN rounds the number of excluded data points down to the nearest multiple of 2. For symmetry, TRIMMEAN excludes a single value from the top and bottom of the data set.

Arguments:

| Name | Type | Description |
|----------------|------------------|--|
| <i>array</i> | array, reference | The numeric values to trim and average. |
| <i>percent</i> | number | The fractional number of data points to exclude from the calculation. [Example: If <i>percent</i> = 0.2, 4 points are trimmed from a data set of 20 points (20x0.2): 2 from the top and 2 from the bottom of the set. end example] |

Return Type and Value: number – The mean of the interior of a data set.

However, if $percen < 0$ or $percen > 1$, #NUM! is returned.

[Example:

TRIMMEAN({4,6,2,5,7,8,9},0.2) results in 5.857142857

end example]

18.17.7.331 TRUE

Syntax:

TRUE ()

Description: Computes the value TRUE. (A call to function TRUE is equivalent to using the *logical-constant* TRUE.)

Arguments: None.

Return Type and Value: logical – The value TRUE.

[Example:

TRUE() results in TRUE

end example]

18.17.7.332 TRUNC

Syntax:

TRUNC (x [, *number-digits*])

Description: Truncates x to the number of fractional digits by *number-digits*.

Arguments:

| Name | Type | Description |
|----------------------|------------------|---|
| x | array, reference | The value to be rounded down. |
| <i>number-digits</i> | number | The number of fractional digits to which x is to be truncated. The default value for <i>number-digits</i> is 0. |

Return Type and Value: number – The truncated value of x .

[Example:

TRUNC(PI()) results in 3

TRUNC(PI(),1) results in 3.1

TRUNC(PI(),3) results in 3.141

TRUNC(PI(),5) results in 3.14159

end example]

18.17.7.333 TTEST

Syntax:

TTEST (*array-1* , *array-2* , *distribution-tails* , *test-type*)

Description: Computes the probability associated with a Student's t-Test.

Arguments:

| Name | Type | Description | | | | | | | | |
|---------------------------|---|---|-------|----------------|---|--------|---|---|---|---|
| <i>array-1</i> | array, reference | The first numerical data set. | | | | | | | | |
| <i>array-1</i> | array, reference | The first numerical data set. | | | | | | | | |
| <i>distribution-tails</i> | number | Specifies the number of distribution tails, truncated to an integer. If 1, TTEST uses the one-tailed distribution. If 2, TTEST uses the two-tailed distribution. | | | | | | | | |
| <i>test-type</i> | number | <div>The truncated-to-integer kind of t-Test to perform, as follows:<table><tr><th>Value</th><th>Test Performed</th></tr><tr><td>1</td><td>Paired</td></tr><tr><td>2</td><td>Two-sample equal variance (homoscedastic)</td></tr><tr><td>3</td><td>Two-sample unequal variance (heteroscedastic)</td></tr></table></div> | Value | Test Performed | 1 | Paired | 2 | Two-sample equal variance (homoscedastic) | 3 | Two-sample unequal variance (heteroscedastic) |
| Value | Test Performed | | | | | | | | | |
| 1 | Paired | | | | | | | | | |
| 2 | Two-sample equal variance (homoscedastic) | | | | | | | | | |
| 3 | Two-sample unequal variance (heteroscedastic) | | | | | | | | | |

Return Type and Value: number – The probability associated with a Student's t-Test.

However, if

- *array-1* and *array-2* have a different number of data points, and *test-type* is 1, the return value is unspecified.
- *distribution-tails* is any value other than 1 or 2, #NUM! is returned.

[Example: Given the following data:

| | A | B |
|---|--------|--------|
| 1 | Data 1 | Data 2 |

| | A | B |
|----|---|----|
| 2 | 3 | 6 |
| 3 | 4 | 19 |
| 4 | 5 | 3 |
| 5 | 8 | 2 |
| 6 | 9 | 14 |
| 7 | 1 | 4 |
| 8 | 2 | 5 |
| 9 | 4 | 17 |
| 10 | 5 | 1 |

TTEST(A2:A10,B2:B10,2,1) results in 0.196016

end example]

18.17.7.334 TYPE

Syntax:

TYPE (*value*)

Description: Computes the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell.

Arguments:

| Name | Type | Description |
|--------------|------|--|
| <i>value</i> | any | The value whose type is to be determined. No conversion shall take place on an argument passed to this function. |

Return Type and Value: number – An integer that indicates the type of *value* or, if *value* is a reference to a single cell, the type of the value in that cell, as follows:

| Type of <i>value</i> | Value Returned |
|----------------------|----------------|
| number | 1 |
| text | 2 |
| logical | 4 |
| error value | 16 |
| array of any kind | 64 |

[Example:

TYPE(10.5) results in 1

TYPE(A10) results in 1, when A10 contains a number

TYPE("ABC") results in 2

TYPE(A10) results in 2, when A10 contains a string

TYPE(TRUE) results in 4

TYPE(A10) results in 4, when A10 contains a logical value

TYPE(5/0) results in 16

TYPE(A10) results in 16, when A10 contains any error value

TYPE({1,2,3}) results in 64

TYPE({TRUE,2.5,#N/A}) results in 64

TYPE(IF(10>5,"Yes",20)) results in 2

TYPE(IF(10<5,"Yes",20)) results in 1

end example]

18.17.7.335 UPPER

Syntax:

UPPER (*string*)

Description: Makes an uppercase version of *string*.

Arguments:

| Name | Type | Description |
|---------------|------|--|
| <i>string</i> | text | Designates the string to be converted. |

Return Type and Value: text – The uppercase version of *string*.

[Example:

UPPER("AbCd123#\$\$%^") results in ABCD123#\$\$%^

UPPER(A10) results in 234FRTQWC\$##, when A10 contains 234FRTqwc\$##

end example]

18.17.7.336 USDOLLAR

Syntax:

USDOLLAR (*number* [, *num-decimal*])

Description: Produces a string containing *number* rounded to *num-decimal* decimal places. The thousands separator is the comma, the radix point is the period, and the currency symbol is "\$". The format used is \$#,##0.00;(\$#,##0.00).

Arguments:

| Name | Type | Description |
|--------------------|--------|--|
| <i>number</i> | number | The number that is to be formatted. |
| <i>num-decimal</i> | number | Designate the number of decimal places to be used in the resulting string; it is truncated to an integer. If <i>num-decimal</i> is negative, <i>number</i> is rounded to the left of the decimal point. If omitted, a value of 2 shall be assumed. |

Return Type and Value: text – The string containing *number* rounded to *num-decimal* decimal places, and have a currency symbol and thousands separators.

[Example:

USDOLLAR(1234.567) results in \$1,234.57

USDOLLAR(1234.567, -2) results in \$1,200

USDOLLAR(-1234.567, 4) results in (\$1,234.5670)

end example]

18.17.7.337 VALUE

Syntax:

VALUE (*string*)

Description: Converts *string* to a number.

Arguments:

| Name | Type | Description |
|---------------|------|---|
| <i>string</i> | text | Designates a string that contains a number formatted using any number, currency, date, or time format. (See §18.8.31 for the set of formats.) Date and time strings are converted to their equivalent serial value. |

Return Type and Value: number – The number represented by *string*.

[Example:

VALUE("123.456") results in 123.456

VALUE("\$1,000") results in 1000

VALUE("23-Mar-2002") results in the corresponding serial value

VALUE("16:48:00")-VALUE("12:17:12") results in 0.188056

end example]

18.17.7.338 VAR

Syntax:

VAR (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note: VAR assumes that its arguments are a sample of the population. If the data represents the entire population, VARP should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARA instead. end note]*

Mathematical Formula:

$$\frac{\sum (x - \bar{x})^2}{(n - 1)}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored. |

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example:*

VAR(1202,1220,1323,1254,1302) results in 2683.2

end example]

18.17.7.339 VARA

Syntax:

VARA (*argument-list*)

Description: Makes an estimate of the variance based on a sample. [*Note:* VARA assumes that its arguments are a sample of the population. If the data represents the entire population, VARPA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VAR instead. *end note]*

Mathematical Formula:

$$\frac{\sum(x - \bar{x})^2}{(n - 1)}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|---|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are samples of the population. Logical values and text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored. |

Return Type and Value: number – An estimate of the variance based on a sample.

[*Example:*

VARA(1202,1220,1323,1254,1302) results in 2683.2

end example]

18.17.7.340 VARP

Syntax:

VARP (*argument-list*)

Description: Computes the variance of an entire population. [Note: VARP assumes that its arguments are the total population. If the data represents a population sample only, VAR should be used instead. If logical values and text representations of numbers in a reference are to be included as part of the calculation, use VARPA instead. *end note*]

Mathematical Formula:

$$\frac{\sum(-\bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. Logical values, and text representations of numbers that are entered directly into the list of arguments are included. If an argument is an array or reference, only numbers in that array or reference are included. Empty cells, logical values, text, or error values in the array or reference are ignored. |

Return Type and Value: number – The variance of an entire population.

[Example:

VARP(1202,1220,1323,1254,1302) results in 2146.56

end example]

18.17.7.341 VARPA

Syntax:

VARPA (*argument-list*)

Description: Makes the variance of an entire population. [Note: VARPA assumes that its arguments are the total population. If the data represents a population sample only, VARA should be used instead. If logical values and text representations of numbers in a reference are to be excluded as part of the calculation, use VARP instead. end note]

Mathematical Formula:

$$\frac{\sum(x - \bar{x})^2}{n}$$

where:

- n = the sample size
- x = a sample value
- \bar{x} = the sample mean AVERAGE(*argument-1*, *argument-1*, ..., *argument-n*)

Arguments:

| Name | Type | Description |
|----------------------|---|--|
| <i>argument-list</i> | logical, number, name, text, array, reference | The <i>arguments</i> in <i>argument-list</i> designate the numbers that are the members of the population. |

Return Type and Value: number – The variance of an entire population.

Arguments can be numbers; names, arrays, or references that contain numbers; text representations of numbers; or logical values, in a reference. Text representations of numbers that are entered directly into the list of arguments are included. Arguments that contain TRUE evaluate as 1; arguments that contain text or FALSE evaluate as zero. If an argument is an array or reference, only values in that array or reference are used. Empty cells and text values in the array or reference are ignored.

[Example:

VARPA(1202,1220,1323,1254,1302) results in 2146.56

end example]

18.17.7.342 VDB

VDB (*cost* , *salvage* , *life* , *start-period* , *end-period* [, [[*factor*]
[, [*no-switch-flag*]]]])

Description: Computes the depreciation of an asset for the period specified, including partial periods, using the double-declining balance or some other specified method.

Arguments:

| Name | Type | Description |
|-----------------------|---------|---|
| <i>cost</i> | number | The number <i>cost</i> is the initial cost of the asset. |
| <i>salvage</i> | number | The value at the end of the depreciation. (This is sometimes called the salvage value of the asset.) This value can be 0. |
| <i>life</i> | number | The number of periods over which the asset is being depreciated. (This is sometimes called the useful life of the asset.) |
| <i>start-period</i> | number | The starting period for which the depreciation is to be calculated. (<i>start-period</i> shall use the same units as <i>life</i> .) |
| <i>end-period</i> | number | The ending period for which the depreciation is to be calculated. (<i>end-period</i> shall use the same units as <i>life</i> .) |
| <i>factor</i> | number | The rate at which the balance declines. If omitted, it is assumed to be 2 (the double-declining balance method). |
| <i>no-switch-flag</i> | logical | Specifies whether to switch to straight-line depreciation when depreciation is greater than the declining balance calculation. If TRUE, straight-line depreciation is not used even when the depreciation is greater than the declining balance calculation. If FALSE or omitted, the straight-line depreciation is used when depreciation is greater than the declining balance calculation. |

Return Type and Value: number – The depreciation of an asset for the period specified.

However, if any numerical argument value is non-positive, #NUM! is returned.

[Example:

VDB(2400,300,10*365,0,1) results in 1.32

VDB(2400,300,10*12,0,1) results in 40.00

VDB(2400,300,10*12,6,18) results in 396.31

end example]

18.17.7.343 VLOOKUP

Syntax:

VLOOKUP (*lookup-value* , *table-array* , *col-index-num* [, [*range-lookup-flag*]])

Description: Performs a vertical search for a value in the left-most column of a table or an array, noting the row in which the matching value is found. From that row, the value from a given column is returned.

Arguments:

| Name | Type | Description |
|--------------------------|--|--|
| <i>lookup-value</i> | value of any type or a reference to a value of any type. | The value to be located in the left-most column of the table. If <i>range-lookup</i> is FALSE and <i>lookup-value</i> is a string, the wildcard characters, question mark (?) and asterisk (*), can be included in <i>lookup-value</i> . A question mark matches any single character; an asterisk matches any sequence of characters. To find a question mark or asterisk, use a tilde (~) before the character. |
| <i>table-array</i> | array, reference, name | Designates the table of information to be searched. The values in the left-most column of <i>table-array</i> can be text, numbers, or logical values. The values in the left-most column of <i>table-array</i> shall be placed in "ascending order", as follows: ..., -2, -1, 0, 1, 2, ..., A–Z, FALSE, TRUE. Uppercase and lowercase text is treated as equivalent. |
| <i>col-index-num</i> | number | The column number in <i>table-array</i> from which the matching value is to be returned. (A <i>col-index-num</i> of 1 returns the left-most column value in <i>table-array</i> , a <i>col-index-num</i> of 2 returns the next column in <i>table-array</i> , and so on.) |
| <i>range-lookup-flag</i> | logical | Specifies whether HLOOKUP is to find an exact or approximate match. If TRUE or omitted, an approximate match is returned. That is, if an exact match is not found, the next largest value that is less than <i>lookup-value</i> is returned. If FALSE, an exact match is performed, in which case, the values in the left-most column of <i>table-array</i> need not be sorted. If there are two or more values in the left-most column of <i>table-array</i> that match <i>lookup-value</i> , the top-most value found is used. |

Return Type and Value: any – The value from a given row number, where the column is determined by a search of the top row looking for a match with a given value.

However, if

- An exact match is performed, but no match is found, #N/A is returned.
- *col-index-num* is less than 1, #VALUE! is returned.
- *col-index-num* is greater than the number of columns in *table-array*, #REF! is returned.
- *lookup-value* is smaller than the smallest value in the left-most column of *table-array*, #N/A is returned.

[Example: Given the following data:

| | A | B | C |
|---|---------|----------|-------|
| 1 | Density | Bearings | Bolts |
| 2 | 0.457 | 3.55 | 500 |

| | A | B | C |
|----|-------|------|-----|
| 3 | 0.525 | 3.25 | 400 |
| 4 | 0.616 | 2.93 | 300 |
| 5 | 0.675 | 2.75 | 250 |
| 6 | 0.746 | 2.57 | 200 |
| 7 | 0.835 | 2.38 | 150 |
| 8 | 0.946 | 2.17 | 100 |
| 9 | 1.09 | 1.95 | 50 |
| 10 | 1.29 | 1.71 | 0 |

VLOOKUP(1,A2:C10,2) results in 2.17
VLOOKUP(1,A2:C10,3,TRUE) results in 100.00
VLOOKUP(2,A2:C10,2,TRUE) results in 1.71

end example]

18.17.7.344 WEEKDAY

Syntax:

WEEKDAY (*serial-value* [, *weekday-start-flag*])

Description: Computes the weekday number for the date having the given *serial-value*, taking into account the current date base value and *weekday-start-flag*, if present. See §18.17.4.1 for special handling of certain days in 1900.

Arguments:

| Name | Type | Description | | | | | | | | | | | | |
|---------------------------|---------------------------------|---|-------|---------|--------------|---------------------------------|---|-------------------------------|---|-------------------------------|----|-------------------------------|----|--------------------------------|
| <i>serial-value</i> | number | The date whose weekday number is to be computed. The value of <i>serial-value</i> is truncated to an integer. | | | | | | | | | | | | |
| <i>weekday-start-flag</i> | number | When truncated to integer, indicates the weekday numbering convention to be used, as follows: <table><tr><th>Value</th><th>Meaning</th></tr><tr><td>1 or omitted</td><td>1 (Sunday) through 7 (Saturday)</td></tr><tr><td>2</td><td>1 (Monday) through 7 (Sunday)</td></tr><tr><td>3</td><td>0 (Monday) through 6 (Sunday)</td></tr><tr><td>11</td><td>1 (Monday) through 7 (Sunday)</td></tr><tr><td>12</td><td>1 (Tuesday) through 7 (Monday)</td></tr></table> | Value | Meaning | 1 or omitted | 1 (Sunday) through 7 (Saturday) | 2 | 1 (Monday) through 7 (Sunday) | 3 | 0 (Monday) through 6 (Sunday) | 11 | 1 (Monday) through 7 (Sunday) | 12 | 1 (Tuesday) through 7 (Monday) |
| Value | Meaning | | | | | | | | | | | | | |
| 1 or omitted | 1 (Sunday) through 7 (Saturday) | | | | | | | | | | | | | |
| 2 | 1 (Monday) through 7 (Sunday) | | | | | | | | | | | | | |
| 3 | 0 (Monday) through 6 (Sunday) | | | | | | | | | | | | | |
| 11 | 1 (Monday) through 7 (Sunday) | | | | | | | | | | | | | |
| 12 | 1 (Tuesday) through 7 (Monday) | | | | | | | | | | | | | |

| Name | Type | Description | | |
|------|------|-------------|----|------------------------------------|
| | | | 13 | 1 (Wednesday) through 7 (Tuesday) |
| | | | 14 | 1 (Thursday) through 7 (Wednesday) |
| | | | 15 | 1 (Friday) through 7 (Thursday) |
| | | | 16 | 1 (Saturday) through 7 (Friday) |
| | | | 17 | 1 (Sunday) through 7 (Saturday) |

Return Type and Value: number – The weekday number for the date having the given serial value.

However, if

- *serial-value* is out of range for the current date base value, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKDAY(DATE(2006,2,1)) results in 4 (Wednesday)
WEEKDAY(DATE(2006,2,1),11) results in 3 (Wednesday)
WEEKDAY(DATE(2006,2,1),12) results in 2 (Wednesday)
WEEKDAY(DATE(2006,2,1),3) results in 2 (Wednesday)

end example]

18.17.7.345 WEEKNUM

Syntax:

WEEKNUM (*serial-value* [, *weekday-start-flag*])

Description: Computes the week number of the date corresponding to *serial-value*. The function allows two number systems:

- System 1: The week containing January 1 is the first week of the year, and is numbered week 1.
- System 2: The week containing the first Thursday of the year is the first week of the year, and is numbered as week 1 [ISO 8601].

Arguments:

| Name | Type | Description |
|---------------------|--------|--|
| <i>serial-value</i> | number | The date whose week number is to be computed. The value of <i>serial-value</i> is truncated to an integer. |

| Name | Type | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---------------------------|---------------------------|--|---------------------------|---------|---------------|--------------|------------------------|----------|---|------------------------|----------|----|------------------------|----------|----|-------------------------|----------|----|---------------------------|----------|----|--------------------------|----------|----|------------------------|----------|----|--------------------------|----------|----|------------------------|----------|----|------------------------|----------|
| <i>weekday-start-flag</i> | number | <p>When truncated to integer, indicates the weekday on which the week begins, as follows:</p> <table> <tr> <th><i>weekday-start-flag</i></th><th>Meaning</th><th>Number System</th></tr> <tr> <td>1 or omitted</td><td>Week begins on Sunday.</td><td>System 1</td></tr> <tr> <td>2</td><td>Week begins on Monday.</td><td>System 1</td></tr> <tr> <td>11</td><td>Week begins on Monday.</td><td>System 1</td></tr> <tr> <td>12</td><td>Week begins on Tuesday.</td><td>System 1</td></tr> <tr> <td>13</td><td>Week begins on Wednesday.</td><td>System 1</td></tr> <tr> <td>14</td><td>Week begins on Thursday.</td><td>System 1</td></tr> <tr> <td>15</td><td>Week begins on Friday.</td><td>System 1</td></tr> <tr> <td>16</td><td>Week begins on Saturday.</td><td>System 1</td></tr> <tr> <td>17</td><td>Week begins on Sunday.</td><td>System 1</td></tr> <tr> <td>21</td><td>Week begins on Monday.</td><td>System 2</td></tr> </table> | <i>weekday-start-flag</i> | Meaning | Number System | 1 or omitted | Week begins on Sunday. | System 1 | 2 | Week begins on Monday. | System 1 | 11 | Week begins on Monday. | System 1 | 12 | Week begins on Tuesday. | System 1 | 13 | Week begins on Wednesday. | System 1 | 14 | Week begins on Thursday. | System 1 | 15 | Week begins on Friday. | System 1 | 16 | Week begins on Saturday. | System 1 | 17 | Week begins on Sunday. | System 1 | 21 | Week begins on Monday. | System 2 |
| <i>weekday-start-flag</i> | Meaning | Number System | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 1 or omitted | Week begins on Sunday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 2 | Week begins on Monday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 11 | Week begins on Monday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 12 | Week begins on Tuesday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 13 | Week begins on Wednesday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 14 | Week begins on Thursday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 15 | Week begins on Friday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 16 | Week begins on Saturday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 17 | Week begins on Sunday. | System 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 21 | Week begins on Monday. | System 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Return Type and Value: number – The week number of the date corresponding to *serial-value*.

However, if

- *serial-value* is out of range for the current date base value, #NUM! is returned.
- *weekday-start-flag* is out of the range specified in the table above, #NUM! is returned.

[Example:

WEEKNUM(DATE(2006,1,1) results in 1
WEEKNUM(DATE(2006,1,1),1) results in 1
WEEKNUM(DATE(2006,1,1),17) results in 1
WEEKNUM(DATE(2006,1,1),21) results in 1
WEEKNUM(DATE(2006,2,1),1) results in 5

WEEKNUM(DATE(2006,2,1),2) results in 6
WEEKNUM(DATE(2006,2,1),11) results in 6

end example]

18.17.7.346 WEIBULL

Syntax:

WEIBULL (*x* , *alpha* , *beta* , *cumulative-flag*)

Description: Computes the Weibull distribution.

Mathematical Formula:

The equation for the Weibull cumulative distribution function is:

$$F(x, \alpha, \beta) = 1 - e^{-(x/\beta)^\alpha}$$

The equation for the Weibull probability density function is:

$$f(x, \alpha, \beta) = \frac{1}{\beta^\alpha} x^{\alpha-1} e^{-(x/\beta)^\alpha}$$

When *alpha* = 1, WEIBULL returns the exponential distribution with:

$$\lambda = \frac{1}{\beta}$$

where:

- *x* = argument *x*
- *α* = argument *alpha*
- *β* = argument *beta*

Arguments:

| Name | Type | Description |
|------------------------|---------|--|
| <i>x</i> | number | The value at which the distribution is to be evaluated. |
| <i>alpha</i> | number | A parameter of the distribution. |
| <i>beta</i> | number | A parameter of the distribution. |
| <i>cumulative-flag</i> | logical | Determines the form of the function. If TRUE, GAMMADIST returns the cumulative distribution function; if FALSE, it returns the probability density function. |

Return Type and Value: number – The Weibull distribution.

However, if

- $x < 0$, #NUM! is returned.
- $\alpha \leq 0$, #NUM! is returned.
- $\beta \leq 0$, #NUM! is returned.

[Example:

WEIBULL(105,20,100,TRUE) results in 0.92958139

WEIBULL(105,20,100,FALSE) results in 0.035588864

end example]

18.17.7.347 WORKDAY

Syntax:

WORKDAY (*start-date* , *day-offset* [, *holidays*])

Description: Computes the serial value of the date that is *day-offset* working days offset from *start-date*. Weekend days (Saturday and Sunday) and any holidays specified by *holidays* are not considered as working days.

Arguments:

| Name | Type | Description |
|-------------------|------------------|---|
| <i>start-date</i> | number | The start date, truncated to integer. |
| <i>day-offset</i> | number | The number of working days before or after <i>start-date</i> . A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . <i>day-offset</i> is truncated to an integer. |
| <i>holidays</i> | reference, array | An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. The ordering of dates or serial values in <i>holidays</i> can be arbitrary. |

Return Type and Value: number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified holidays.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- Any date in *holidays* is out of range for the current date base value, #NUM! is returned.

- *start-date* plus *day-offset* does not yield a date, #NUM! is returned.

[Example:

WORKDAY(DATE(2006,1,1),0) results in a serial value corresponding to 1-Jan-2006

WORKDAY(DATE(2006,1,1),10) results in a serial value corresponding to 13-Jan-2006

WORKDAY(DATE(2006,1,1),-10) results in a serial value corresponding to 19-Dec-2005

WORKDAY(DATE(2006,1,1),20,{"2006/1/2","2006/1/16"}) results in a serial value corresponding to 31-Jan-2006

end example]

18.17.7.348 WORKDAY.INTL

Syntax:

Number form: WORKDAY.INTL (*start-date* , *day-offset* [, *weekend-number*] [, *holidays*])

String form: WORKDAY.INTL (*start-date* , *day-offset* [, *weekend-string*] [, *holidays*])

Description: Computes the serial value of the date that is *day-offset* working days offset from *start-date*. Weekend days and any holidays specified by *holidays* are not considered as working days.

Arguments:

| Name | Type | Description |
|-----------------------|------------------|--|
| <i>start-date</i> | number | The start date, truncated to integer. |
| <i>day-offset</i> | number | The number of working days before or after <i>start-date</i> . A positive value yields a future date; a negative value yields a past date; a zero value yields the date <i>start-date</i> . <i>day-offset</i> is truncated to an integer. |
| <i>weekend-number</i> | number | Indicates the days of the week that are weekend days and are not considered working days. Values are shown in the table below |
| <i>weekend-string</i> | string | Indicates the days of the week that are weekend days and are not considered working days. Values of <i>weekend-string</i> are seven characters long and each character in the string represents a day of the week, beginning with Monday. [Example: "0000011" would result in a weekend that is Saturday and Sunday. end example] |
| <i>holidays</i> | reference, array | An optional set of one or more dates that are to be excluded from the working day calendar. <i>holidays</i> shall be a range of cells that contain the dates, or an array constant of the serial values that represent those dates. |

| Name | Type | Description |
|------|------|---|
| | | The ordering of dates or serial values in <i>holidays</i> can be arbitrary. |

| <i>weekend-number</i> | Weekend days |
|-----------------------|---------------------|
| 1 or omitted | Saturday, Sunday |
| 2 | Sunday, Monday |
| 3 | Monday, Tuesday |
| 4 | Tuesday, Wednesday |
| 5 | Wednesday, Thursday |
| 6 | Thursday, Friday |
| 7 | Friday, Saturday |
| 11 | Sunday only |
| 12 | Monday only |
| 13 | Tuesday only |
| 14 | Wednesday only |
| 15 | Thursday only |
| 16 | Friday only |
| 17 | Saturday only |

Return Type and Value: number – The serial value of the date that is *day-offset* working days offset from *start-date*, excluding the specified weekend days and holidays.

However, if

- *start-date* is out of range for the current date base value, #NUM! is returned.
- Any date in *holidays* is out of range for the current date base value, #NUM! is returned.
- *start-date* plus *day-offset* does not yield a date, #NUM! is returned.

[Example:

WORKDAY.INTL (DATE (2006,1,1),0) results in a serial value corresponding to 1-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),10) results in a serial value corresponding to 13-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),10,7) results in a serial value corresponding to 13-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),-10) results in a serial value corresponding to 19-Dec-2005

WORKDAY.INTL (DATE (2006,1,1),20,1,{"2006/1/2","2006/1/16"}) results in a serial value corresponding to 31-Jan-2006

WORKDAY.INTL (DATE (2006,1,1),20,"0000011",{"2006/1/2","2006/1/16"}) results in a serial value

corresponding to 31-Jan-2006

end example]

18.17.7.349 XIRR

XIRR (*values* , *dates* [, [*guess*]])

Description: Computes the internal rate of return for a schedule of cash flows that is not necessarily periodic. XIRR uses an iterative calculation technique that cycles through the calculation until the result is accurate within 0.000001 percent.

Mathematical Formula:

Using a changing rate (starting with *guess*), XIRR cycles through the calculation until the result is accurate within 0.000001 percent. The rate is changed until:

$$0 = \sum_{i=1}^N \frac{P_i}{(1 + rate)^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th} , or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th} , or last, payment.

Arguments:

| Name | Type | Description |
|---------------|------------------|---|
| <i>values</i> | array, reference | A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value. |
| <i>dates</i> | reference | A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored. |
| <i>guess</i> | number | An estimate of the result of XIRR. If omitted, it is assumed to be 0.1 (i.e., 10 percent). |

Return Type and Value: number – The internal rate of return for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- *values* and *dates* contain different numbers of values, #NUM! is returned.
- The calculation has not converged after an implementation-defined number of tries, #NUM! is returned.

[Example: When the cells F2397:J2397 contain the dates January 1, 2008; March 1, 2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XIRR({-10000,2750,4250,3250,2750},F2397:J2397,0.1) results in 37.34%

end example]

18.17.7.350 XNPV

XNPV (*rate* , *values* , *dates*)

Description: Computes the net present value for a schedule of cash flows that is not necessarily periodic.

Mathematical Formula:

$$XNPV = \sum_{i=1}^N \frac{P_i}{(1 + rte)^{\frac{(d_i - d_1)}{365}}}$$

where:

- d_i = the i^{th} , or last, payment date.
- d_1 = the 0^{th} payment date.
- P_i = the i^{th} , or last, payment.

Arguments:

| Name | Type | Description |
|---------------|------------------|---|
| <i>rate</i> | number | The discount rate to apply to the cash flows. |
| <i>values</i> | array, reference | A series of cash flows that corresponds to a schedule of payment dates specified in <i>dates</i> . The first payment is optional and corresponds to a cost or payment that occurs at the beginning of the investment. If the first value is a cost or payment, it shall have a negative value. All succeeding payments are discounted based on a 365-day year. The series of values shall contain at least one positive and one negative value. |

| Name | Type | Description |
|--------------|-----------|--|
| <i>dates</i> | reference | A schedule of payment dates that corresponds to the cash flow payments in <i>values</i> . The first payment date indicates the beginning of the schedule of payments. All other dates shall be later than this date, but they can occur in any order. Time information in the date arguments is ignored. |

Return Type and Value: number – The net present value for a schedule of cash flows that is not necessarily periodic.

However, if

- Any date in *dates* is out of range for the current date base value, #NUM! is returned.
- Any date in *dates* precedes the starting date, #NUM! is returned.
- *values* and *dates* contain different numbers of values, #NUM! is returned.

[Example: When the cells F2397:J2397 contain the dates January 1, 2008; March 1,2008; October 30, 2008; February 15, 2009, and April 1, 2009:

XNPV(0.09, {-10000, 2750, 4250, 3250, 2750}, F2397:J2397) results in 2086.65

end example]

18.17.7.351 YEAR

Syntax:

YEAR (*date-value*)

Description: Computes the numeric year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*, taking into account the current date base value. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a *string-constant* having any date and/or time format, in which case, any time information shall be ignored.

Arguments:

| Name | Type | Description |
|-------------------|--------------|---|
| <i>date-value</i> | number, text | The date and/or time whose year is to be computed. That date and/or time shall be expressed either as a serial value, in which case, its fractional part is ignored, or as a <i>string-constant</i> having any date and/or time format, in which case, any time information shall be ignored. |

Return Type and Value: number – The year in the Gregorian calendar [ISO 8601 §3.2.1] for the date and/or time having the given *date-value*. The range of return values is determined by the date base currently in use (§18.17.4).

However, if *date-value* is out of range for the current date base value, #NUM! is returned.

[Example:

YEAR(DATE(2006,1,2)) results in 2006

YEAR(DATE(2006,0,2)) results in 2005

YEAR("2006/1/2 10:45 AM") results in 2006

YEAR(30000) results in 1982 for the 1900 date base system, or 1986 for the 1904 date base system

end example]

18.17.7.352 YEARFRAC

Syntax:

YEARFRAC (*start-date* , *end-date* [, *basis*])

Description: Computes the fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*.

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|---|-------|-----------------|--------------|--|
| <i>start-date</i> | number | The period's starting date. <i>start-date</i> can be earlier than, the same as, or later than <i>end-date</i> . | | | | |
| <i>end-date</i> | number | The period's ending date. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div></td></tr></table></div> | Value | Day Count Basis | 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div> |
| Value | Day Count Basis | | | | | |
| 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months</div> | | | | | |

| Name | Type | Description | |
|------|------|-------------|--|
| | | | with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none"> • If the date is 28 or 29 February, it |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | <p>is adjusted to 30 February.</p> <ul style="list-style-type: none"> For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

All arguments are truncated to integers.

Return Type and Value: number – The fractional number of years represented by the number of whole days between two dates, *start-date* and *end-date*., according to *basis*. If the Actual/actual basis is used, the year length used is the average length of the years that the range crosses, regardless of where *start-date* and *end-date* fall in their respective years.

However, if the value of *basis* is out of range, #NUM! is returned.

[Example:

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 3, 26)) results in 0.236111111

YEARFRAC (DATE (2006, 3, 26), DATE (2006, 1, 1)) results in 0.236111111

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1)) results in 0.5

YEARFRAC (DATE (2006, 1, 1), DATE (2007, 9, 1)) results in 1.666666667

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1), 0) results in 0.5

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1), 1) results in 0.495890411

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1), 2) results in 0.502777778

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1), 3) results in 0.495890411

YEARFRAC (DATE (2006, 1, 1), DATE (2006, 7, 1), 4) results in 0.5

YEARFRAC (DATE (2004, 3, 1), DATE (2006, 3, 1), 1) results in 1.998175 (because 2004 is a leap year and Actual/actual basis is used, the average year length is 365.3333)

end example]

18.17.7.353 YIELD

Syntax:

YIELD (*settlement* , *maturity* , *rate* , *pr* , *redemption* , *frequency* [, [*basis*]])

Description: Computes the yield on a security that pays periodic interest.

Mathematical Formula:

If there is one coupon period or less until redemption, YIELD is calculated as follows:

$$YIELD = \frac{\left(\frac{redemption}{100} + \frac{rate}{frequency} \right) - \left(\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency} \right) \right)}{\frac{par}{100} + \left(\frac{A}{E} \times \frac{rate}{frequency} \right)} \times \frac{frequency \times E}{DSR}$$

where:

- *A* = number of days from the beginning of the coupon period to the settlement date (accrued days).
- *DSR* = number of days from the settlement date to the redemption date.
- *E* = number of days in the coupon period.
- *frequency* = argument *frequency*
- *par* = argument *pr*
- *rate* = argument *rate*
- *redemption* = argument *redemption*

If there is more than one coupon period until redemption, YIELD is calculated through some number of iterations. The resolution uses the Newton method, based on the formula used for the function PRICE. The yield is changed until the estimated price given the yield is close to price.

Arguments:

| Name | Type | Description |
|-------------------|--------|---|
| <i>settlement</i> | number | The security's settlement date. |
| <i>maturity</i> | number | The security's maturity date. |
| <i>rate</i> | number | The security's interest rate. |
| <i>pr</i> | number | The security's price. |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. |
| <i>frequency</i> | number | the number of coupon payments per year. (For annual payments, <i>frequency</i> is 1; for semiannual payments, <i>frequency</i> is 2; for quarterly payments, <i>frequency</i> is 4.) <i>frequency</i> is truncated to an integer. |

| Name | Type | Description | | | | | | | | |
|--------------|--|--|--|-----------------|--------------|--|---|--|---|--|
| <i>basis</i> | number | The truncated integer type of day count basis to use, as follows: | | | | | | | | |
| | | <table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</td></tr><tr><td>1</td><td>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days.</td></tr><tr><td>2</td><td>Actual/360. Similar to Basis 1, but only has</td></tr></table> | Value | Day Count Basis | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. | 2 | Actual/360. Similar to Basis 1, but only has |
| | | Value | Day Count Basis | | | | | | | |
| | | 0 or omitted | US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments: <ul style="list-style-type: none">• If the date is 28 or 29 February, it is adjusted to 30 February.• For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. | | | | | | | |
| 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. | | | | | | | | | |
| 2 | Actual/360. Similar to Basis 1, but only has | | | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | 360 days per year. |
| | | | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The yield on a security that pays periodic interest.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* $<$ 0, #NUM! is returned.

- *pr* or *redemption* ≤ 0 , #NUM! is returned.
- *frequency* is any number other than 1, 2, or 4, #NUM! is returned.
- *basis* < 0 or *basis* > 4 , #NUM! is returned.

[Example:

YIELD(DATE(2008,2,15),DATE(2016,11,15),0.0575,95.04287,100,2,0) results in 6.5000%

end example]

18.17.7.354 YIELDDISC

Syntax:

YIELDDISC (*settlement* , *maturity* , *pr* , *redemption* [, [*basis*]])

Description: Computes the annual yield for a discounted security.

Arguments:

| Name | Type | Description | | | | |
|-------------------|--|---|-------|-----------------|--------------|--|
| <i>settlement</i> | number | The security's settlement date. | | | | |
| <i>maturity</i> | number | The security's maturity date. | | | | |
| <i>pr</i> | number | The security's price. | | | | |
| <i>redemption</i> | number | The security's redemption value per \$100 face value. | | | | |
| <i>basis</i> | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div></td></tr></table></div> | Value | Day Count Basis | 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div> |
| Value | Day Count Basis | | | | | |
| 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date</div> | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change. |
| | | 1 | Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield for a discounted security.

However, if

- *settlement* or *maturity* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *pr* or *redemption* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

YIELDDISC (DATE (2008,2,16),DATE (2008,3,1),99.795,100,2) results in 5.2823%

end example]

18.17.7.355 YIELDMAT

Syntax:

YIELDMAT (*settlement* , *maturity* , *issue* , *rate* , *pr* [, [*basis*]])

Description: Computes the annual yield of a security that pays interest at maturity.

Arguments:

| Name | Type | Description |
|-------------------|--------|---------------------------------|
| <i>settlement</i> | number | The security's settlement date. |

| Name | Type | Description | | | | | | |
|--------------|--|--|-------|-----------------|--------------|--|---|---|
| maturity | number | The security's maturity date. | | | | | | |
| issue | number | The security's issue date. | | | | | | |
| rate | number | The security's interest rate. | | | | | | |
| pr | number | The security's price. | | | | | | |
| basis | number | <div>The truncated integer type of day count basis to use, as follows:<table><tr><th>Value</th><th>Day Count Basis</th></tr><tr><td>0 or omitted</td><td><div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div></td></tr><tr><td>1</td><td><div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div></td></tr></table></div> | Value | Day Count Basis | 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div> | 1 | <div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div> |
| Value | Day Count Basis | | | | | | | |
| 0 or omitted | <div>US (NASD) 30/360. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:<ul style="list-style-type: none">If the date is 28 or 29 February, it is adjusted to 30 February.For months with 31 days, if the first date has a day value of 31, the date is converted to day 30. If the second date has a day value of 31, it is changed to 30 days as long as the first date was not 28 or 29 February, in which case it does not change.</div> | | | | | | | |
| 1 | <div>Actual/actual. The actual number of days between the two dates are counted. If the date range includes the date 29 February, the</div> | | | | | | | |

| Name | Type | Description | |
|------|------|-------------|---|
| | | | year is 366 days; otherwise it is 365 days. |
| | | 2 | Actual/360. Similar to Basis 1, but only has 360 days per year. |
| | | 3 | Actual/365. Similar to Basis 1, but always has 365 days per year. |
| | | 4 | <p>European 30/360. The European method for adjusting day counts. Assumes that each month has 30 days and the total number of days in the year is 360 by making the following adjustments:</p> <ul style="list-style-type: none"> • If the date is 28 or 29 February, it is adjusted to 30 February. • For months with 31 days, all dates with a day value of 31 are changed to day 30, including situations where the first date is 28 or 29 February. |

Time information in the date arguments is ignored.

Return Type and Value: number – The annual yield of a security that pays interest at maturity.

However, if

- *settlement*, *maturity*, or *issue* is out of range for the current date base value, #NUM! is returned.
- *settlement* \geq *maturity*, #NUM! is returned.
- *rate* or *pr* \leq 0, #NUM! is returned.
- *basis* $<$ 0 or *basis* $>$ 4, #NUM! is returned.

[Example:

YIELDMAT (DATE (2008, 3, 15), DATE (2008, 11, 3), DATE (2007, 11, 8), 0.0625, 100.0123, 0) results in 6.0954%

end example]

18.17.7.356 ZTEST

Syntax:

ZTEST (*array* , *test-value* [, *sigma*])

Description: Computes the one-tailed probability-value of a z-test. For a given hypothesized population mean, *test-value*, ZTEST returns the probability that the sample mean would be greater than the average of observations in the data set *array*; that is, the observed sample mean.

Mathematical Formula:

When *sigma* is present:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST \left((\bar{x} - \mu_0) / (\sigma / \sqrt{n}) \right)$$

When *sigma* is omitted:

$$ZTEST(array, \mu_0) = 1 - NORMSDIST \left((\bar{x} - \mu_0) / (s / \sqrt{n}) \right)$$

where:

- *n* = the number of observations in the sample COUNT (*array*)
- *s* = the sample standard deviation STDEV (*array*)
- *x* = a sample value
- \bar{x} = the sample mean AVERAGE (*array*)
- μ_0 = the argument *test-value*

Arguments:

| Name | Type | Description |
|--------------|-------|---|
| <i>array</i> | array | The set of numerical data against which to test <i>test-value</i> . |

| Name | Type | Description |
|-------------------|--------|---|
| <i>test-value</i> | number | The number to test. |
| <i>sigma</i> | number | The number is the population (known) standard deviation. If omitted, the sample standard deviation is used. |

Return Type and Value: number – The one-tailed probability-value of a z-test.

However, if *array* is empty, the return value is unspecified.

[Example:

ZTEST({3,6,7,8,6,5,4,2,1,9},4) results in 0.090574197

ZTEST({3,6,7,8,6,5,4,2,1,9},6) results in 0.863043389

end example]

18.18 Simple Types

This is the complete list of simple types dedicated to SpreadsheetML.

18.18.1 ST_Axis (PivotTable Axis)

This simple type defines the axes for a PivotTable selection.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|-------------|
| axisCol (Column Axis) | Column axis |
| axisPage (Include Count Filter) | Page axis |
| axisRow (Row Axis) | Row axis |
| axisValues (Values Axis) | Values axis |

| Referenced By |
|--|
| pivotArea@axis (§18.3.1.68); pivotField@axis (§18.10.1.69); pivotSelection@axis (§18.3.1.69) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Axis](#)) is located in §A.2. end note]

18.18.2 ST_BorderId (Border Id)

Zero-based index of the border record used by this cell format.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|------------------------|
| xf@borderId (§18.8.45) |

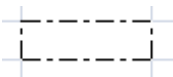

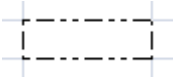

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_BorderId](#)) is located in §A.2. *end note*]

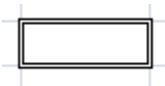

18.18.3 ST_BorderStyle (Border Line Styles)

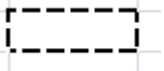

The line style of a border in a cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|--|
| dashDot (Dash Dot) | The line style of a border is dash-dot. [Example:  <i>end example</i>] |
| dashDotDot (Dash Dot Dot) | The line style of a border is dash-dot-dot. [Example:  <i>end example</i>] |
| dashed (Dashed) | The line style of a border is dashed. [Example:  <i>end example</i>] |

| Enumeration Value | Description |
|--|--|
| dotted (Dotted) | <p>The line style of a border is dotted.</p> <p>[Example:</p>  <p>end example]</p> |
| double (Double Line) | <p>The line style of a border is double line.</p> <p>[Example:</p>  <p>end example]</p> |
| hair (Hairline Border) | <p>The line style of a border is hairline.</p> <p>[Example:</p>  <p>end example]</p> |
| medium (Medium Border) | <p>The line style of a border is medium.</p> <p>[Example:</p>  <p>end example]</p> |
| mediumDashDot (Medium Dash Dot) | <p>The line style of a border is medium dash-dot.</p> <p>[Example:</p>  <p>end example]</p> |
| mediumDashDotDot (Medium Dash Dot Dot) | <p>The line style of a border is medium dash-dot-dot.</p> <p>[Example:</p> |

| Enumeration Value | Description |
|-------------------------------|---|
| |  <i>end example]</i> |
| mediumDashed (Medium Dashed) | <p>The line style of a border is medium dashed.</p> <p>[Example:</p>  <i>end example]</i> |
| none (None) | <p>The line style of a border is none (no border visible).</p> <p>[Example:</p>  <i>end example]</i> |
| slantDashDot (Slant Dash Dot) | <p>The line style of a border is slant-dash-dot.</p> <p>[Example:</p>  <i>end example]</i> |
| thick (Thick Line Border) | <p>The line style of a border is 'thick'.</p> <p>[Example:</p>  <i>end example]</i> |
| thin (Thin Border) | <p>The line style of a border is thin.</p> <p>[Example:</p>  |

| Enumeration Value | Description |
|-------------------|---------------------|
| | <i>end example]</i> |

| Referenced By |
|---|
| bottom@style (§18.8.6); diagonal@style (§18.8.13); end@style (§18.8.16); horizontal@style (§18.8.25); start@style (§18.8.37); top@style (§18.8.43); vertical@style (§18.8.44) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_BorderStyle](#)) is located in §A.2.
end note]

18.18.4 ST_CalcMode (Calculation Mode)

This simple type defines the supported modes for performing calculations on workbook data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| auto (Automatic) | Indicates that calculations in the workbook are performed automatically when cell values change. The application recalculates those cells that are dependent on other cells that contain changed values. This mode of calculation helps to avoid unnecessary calculations. |
| autoNoTable (Automatic Calculation (No Tables)) | Indicates tables be excluded during automatic calculation. |
| manual (Manual Calculation Mode) | Indicates that calculations in the workbook be triggered manually by the user. For example, the application might expose a command in the user interface. |

| Referenced By |
|---------------------------|
| calcPr@calcMode (§18.2.2) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_CalcMode](#)) is located in §A.2.
end note]

18.18.5 ST_CellComments (Cell Comments)

These enumerations specify how cell comments shall be displayed for paper printing purposes.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| asDisplayed (Print Comments As Displayed) | Print cell comments as displayed. |
| atEnd (Print At End) | Print cell comments at end of document. |
| none (None) | Do not print cell comments. |

| Referenced By |
|-------------------------------------|
| pageSetup@cellComments (§18.3.1.63) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellComments](#)) is located in §A.2. *end note*]

18.18.6 ST_CellFormulaType (Formula Type)

Indicates the type of formula in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|--------------------------------------|
| array (Array Formula) | Formula is an array formula. |
| dataTable (Table Formula) | Formula is a data table formula. |
| normal (Normal) | Formula is a regular cell formula. |
| shared (Shared Formula) | Formula is part of a shared formula. |

| Referenced By |
|------------------|
| f@t (§18.3.1.40) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellFormulaType](#)) is located in §A.2. *end note*]

18.18.7 ST_CellRef (Cell Reference)

Represents a single cell reference in a SpreadsheetML document.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |
|---|
| c@r (§18.6.1); c@r (§18.3.1.4); cell@r (§18.14.1); cellSmartTags@r (§18.3.1.7); cellWatch@r (§18.3.1.8); customSheetView@topLeftCell (§18.3.1.25); f@r1 (§18.3.1.40); f@r2 (§18.3.1.40); inputCells@r (§18.3.1.52); nc@r (§18.11.1.3); oc@r (§18.11.1.5); pane@topLeftCell (§18.3.1.66); rcmt@cell (§18.11.1.11); selection@activeCell (§18.3.1.78); sheetView@topLeftCell (§18.3.1.87); singleXmlCell@r (§18.5.2.1); tr@r (§18.15.4); undo@r (§18.11.1.25) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellRef](#)) is located in §A.2. *end note*]

18.18.8 ST_CellSpan (Cell Span Type)

A single cell span item.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |
|-------------------------|
| ST_CellSpans (§18.18.9) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellSpan](#)) is located in §A.2. *end note*]

18.18.9 ST_CellSpans (Cell Spans)

List of the cell spans of the item.

This simple type allows a list of items of the ST_CellSpan simple type (§18.18.8).

| Referenced By |
|------------------------|
| row@spans (§18.3.1.73) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellSpans](#)) is located in §A.2. *end note*]

18.18.10 ST_CellStyleXfId (Cell Style Format Id)

Used by xf records and cellStyle records to reference xf records defined in the cellStyleXfs collection.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|--|
| cellStyle@xfId (§18.8.7); xf@xfId (§18.8.45) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellStyleXfld](#)) is located in §A.2. *end note*]

18.18.11 ST_CellType (Cell Type)

Indicates the cell's data type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|---|
| b (Boolean) | Cell containing a boolean. |
| d (Date) | Cell contains a date in the ISO 8601 format. |
| e (Error) | Cell containing an error. |
| inlineStr (Inline String) | Cell containing an (inline) rich string, i.e., one not in the shared string table. If this cell type is used, then the cell value is in the <i>is</i> element rather than the <i>v</i> element in the cell (<i>c</i> element). |
| n (Number) | Cell containing a number. |
| s (Shared String) | Cell containing a shared string. |
| str (String) | Cell containing a formula string. |

| Referenced By |
|--|
| c@t (§18.3.1.4); cell@t (§18.14.1); nc@t (§18.11.1.3); oc@t (§18.11.1.5) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CellType](#)) is located in §A.2. *end note*]

18.18.12 ST_CfType (Conditional Format Type)

Conditional format rule type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------------|--|
| aboveAverage (Above or Below Average) | This conditional formatting rule highlights cells that are above or below the average for all values in the range. |
| beginsWith (Begins With) | This conditional formatting rule highlights cells in the range that begin with the given text. Equivalent to using the LEFT() sheet function and comparing values. |

| Enumeration Value | Description |
|---|---|
| cellIs (Cell Is) | This conditional formatting rule compares a cell value to a formula calculated result, using an operator. |
| colorScale (Color Scale) | This conditional formatting rule creates a graduated color scale on the cells. |
| containsBlanks (Contains Blanks) | This conditional formatting rule highlights cells that are completely blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank. |
| containsErrors (Contains Errors) | This conditional formatting rule highlights cells with formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error. |
| containsText (Contains Text) | This conditional formatting rule highlights cells containing given text. Equivalent to using the SEARCH() sheet function to determine whether the cell contains the text. |
| dataBar (Data Bar) | This conditional formatting rule displays a graduated data bar in the range of cells. |
| duplicateValues (Duplicate Values) | This conditional formatting rule highlights duplicated values. |
| endsWith (Ends With) | This conditional formatting rule highlights cells ending with given text. Equivalent to using the RIGHT() sheet function and comparing values. |
| expression (Expression) | This conditional formatting rule contains a formula to evaluate. When the formula result is true, the cell is highlighted. |
| iconSet (Icon Set) | This conditional formatting rule applies icons to cells according to their values. |
| notContainsBlanks (Contains No Blanks) | This conditional formatting rule highlights cells that are not blank. Equivalent of using LEN(TRIM()). This means that if the cell contains only characters that TRIM() would remove, then it is considered blank. An empty cell is also considered blank. |
| notContainsErrors (Contains No Errors) | This conditional formatting rule highlights cells without formula errors. Equivalent to using ISERROR() sheet function to determine if there is a formula error. |
| notContainsText (Does Not Contain Text) | This conditional formatting rule highlights cells that do not contain given text. Equivalent to using the SEARCH() sheet function. |
| timePeriod (Time Period) | This conditional formatting rule highlights cells containing dates in the specified time period. The |

| Enumeration Value | Description |
|------------------------------|---|
| | underlying value of the cell is evaluated, therefore the cell does not need to be formatted as a date to be evaluated. For example, with a cell containing the value 38913 the conditional format shall be applied if the rule requires a value of 7/14/2006. |
| top10 (Top 10) | This conditional formatting rule highlights cells whose values fall in the top N or bottom N bracket, as specified. |
| uniqueValues (Unique Values) | This conditional formatting rule highlights unique values in the range. |

| Referenced By |
|--------------------------|
| cfRule@type (§18.3.1.10) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CfType](#)) is located in §A.2. *end note*]

18.18.13 ST_CfvoType (Conditional Format Value Object Type)

This simple type expresses the type of the conditional formatting value object (cfvo). In general the cfvo specifies one value used in the graduated scale (max, min, midpoint, etc).

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|--|
| formula (Formula) | The minimum/ midpoint / maximum value for the gradient is determined by a formula. |
| max (Maximum) | Indicates that the maximum value in the range shall be used as the maximum value for the gradient. |
| min (Minimum) | Indicates that the minimum value in the range shall be used as the minimum value for the gradient. |
| num (Number) | Indicates that the minimum / midpoint / maximum value for the gradient is specified by a constant numeric value. |
| percent (Percent) | Value indicates a percentage between the minimum and maximum values in the range shall be used as the minimum / midpoint / maximum value for the gradient. |
| percentile (Percentile) | Value indicates a percentile ranking in the range shall |

| Enumeration Value | Description |
|-------------------|---|
| | be used as the minimum / midpoint / maximum value for the gradient. |

| Referenced By |

| cfvo@type (§18.3.1.11) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CfvoType](#)) is located in §A.2. *end note*]

18.18.14 ST_Comments (Comment Display Types)

This simple type defines options for displaying comments in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|---|
| commIndAndComment (Show Comment & Indicator) | Indicates that both the comment indicator and comment text be show in the user interface. |
| commIndicator (Show Comment Indicator) | Indicates that only the comment indicator be shown in the user interface. |
| commNone (No Comments) | Indicates that comments not be shown in the user interface. |

| Referenced By |
|---|
| customWorkbookView@showComments (§18.2.3) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Comments](#)) is located in §A.2. *end note*]

18.18.15 ST_ConditionalFormattingOperator (Conditional Format Operators)

These conditional format operators are used for "Highlight Cells That Contain..." rules. For example, "highlight cells that begin with "M2" and contain "Mountain Gear"".

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|-------------------------------------|
| beginsWith (Begins With) | 'Begins with' operator |
| between (Between) | 'Between' operator |
| containsText (Contains) | 'Contains' operator |
| endsWith (Ends With) | 'Ends with' operator |
| equal (Equal) | 'Equal to' operator |
| greaterThan (Greater Than) | 'Greater than' operator |
| greaterThanOrEqual (Greater Than Or Equal) | 'Greater than or equal to' operator |
| lessThan (Less Than) | 'Less than' operator |
| lessThanOrEqual (Less Than Or Equal) | 'Less than or equal to' operator |
| notBetween (Not Between) | 'Not between' operator |
| notContains (Does Not Contain) | 'Does not contain' operator |
| notEqual (Not Equal) | 'Not equal to' operator |

| Referenced By |

| cfRule@operator (§18.3.1.10) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ConditionalFormattingOperator](#)) is located in §A.2. *end note*]

18.18.16 ST_CredMethod (Credentials Method)

Credentials method used for server access.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|----------------------------|
| integrated (Integrated Authentication) | Integrated authentication. |
| none (No Credentials) | Use no credentials at all. |
| prompt (Prompt Credentials) | Prompt for credentials. |
| stored (Stored Credentials) | Use stored credentials. |

| Referenced By |
|-----------------------------------|
| connection@credentials (§18.13.1) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_CredMethod](#)) is located in §A.2. *end note*]

18.18.17 ST_DataConsolidateFunction (Data Consolidation Functions)

Data consolidation functions specified by the user and used to consolidate ranges of data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------|---|
| average (Average) | The average of the values. |
| count (Count) | The number of data values. The Count consolidation function works the same as the COUNTA worksheet function. |
| countNums (CountNums) | The number of data values that are numbers. The Count Nums consolidation function works the same as the COUNT worksheet function. |
| max (Maximum) | The largest value. |
| min (Minimum) | The smallest value. |
| product (Product) | The product of the values. |
| stdDev (StdDev) | An estimate of the standard deviation of a population, where the sample is a subset of the entire population. |
| stdDevp (StdDevP) | The standard deviation of a population, where the population is all of the data to be summarized. |
| sum (Sum) | The sum of the values. |
| var (Variance) | An estimate of the variance of a population, where the sample is a subset of the entire population. |
| varp (VarP) | The variance of a population, where the population is all of the data to be summarized. |

| Referenced By |
|---|
| dataConsolidate@function (§18.3.1.29); dataField@subtotal (§18.10.1.22) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataConsolidateFunction](#)) is located in §A.2. *end note*]

18.18.18 ST_DataValidationErrorStyle (Data Validation Error Styles)

The style of data validation error alert.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|--|
| information (Information Icon) | This data validation error style uses an information icon in the error alert.  |
| stop (Stop Icon) | This data validation error style uses a stop icon in the error alert.  |
| warning (Warning Icon) | This data validation error style uses a warning icon in the error alert.  |

| Referenced By |
|--|
| dataValidation@errorStyle (§18.3.1.32) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationErrorStyle](#)) is located in §A.2. *end note*]

18.18.19 ST_DataValidationImeMode (Data Validation IME Mode)

These values specify that the IME (input method editor) mode is controlled by data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| disabled (Disabled IME Mode) | IME mode is disabled. Forces the IME control to be disabled when this cell is selected. |
| fullAlpha (Full-Width Alpha-Numeric IME Mode) | Forces the IME control to be on and in full-width alphanumeric input mode when the cell is first selected. |
| fullHangul (Full Width Hangul) | Forces the IME control to be on and in full-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected. |

| Enumeration Value | Description |
|---|--|
| fullKatakana (Full Katakana IME Mode) | Forces the IME control to be on and in full-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected. |
| halfAlpha (Half Alpha IME) | Forces the IME control to be on and in half-width alph-numeric input mode when the cell is first selected. |
| halfHangul (Half-Width Hangul IME Mode) | Forces the IME control to be on and in half-width Hangul input mode when first selecting the cell. Applies when the application's language is Korean and a Korean IME control is selected. |
| halfKatakana (Half-Width Katakana) | Forces the IME control to be on and in half-width Katakana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected. |
| hiragana (Hiragana IME Mode) | Forces the IME control to be on and in Hiragana input mode when first selecting the cell. Applies when the application's language is Japanese and a Japanese IME control is selected |
| noControl (IME Mode Not Controlled) | Data validation does not control the IME control's mode. |
| off (IME Off) | Forces the IME control to be off when first selecting the cell (goes to direct cell input mode). |
| on (IME On) | Forces the IME control to be on when first selecting the cell. |

| Referenced By |
|-------------------------------------|
| dataValidation@imeMode (§18.3.1.32) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationImeMode](#)) is located in §A.2. *end note*]

18.18.20 ST_DataValidationOperator (Data Validation Operator)

The relational operator used in data validation.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| between (Between) | Data validation which checks if a value is between two |

| Enumeration Value | Description |
|--|--|
| | other values. |
| equal (Equal) | Data validation which checks if a value is equal to a specified value. |
| greaterThan (Greater Than) | Data validation which checks if a value is greater than a specified value. |
| greaterThanOrEqual (Greater Than Or Equal) | Data validation which checks if a value is greater than or equal to a specified value. |
| lessThan (Less Than) | Data validation which checks if a value is less than a specified value. |
| lessThanOrEqual (Less Than Or Equal) | Data validation which checks if a value is less than or equal to a specified value. |
| notBetween (Not Between) | Data validation which checks if a value is not between two other values. |
| notEqual (Not Equal) | Data validation which checks if a value is not equal to a specified value. |

| Referenced By |
|--------------------------------------|
| dataValidation@operator (§18.3.1.32) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_DataValidationOperator](#)) is located in §A.2. *end note*]

18.18.21 ST_DataValidationType (Data Validation Type)

Specifies the type of data validation used to validate user input.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---|
| custom (Custom) | Data validation which uses a custom formula to check the cell value. |
| date (Date) | Data validation which checks for date values satisfying the given condition. |
| decimal (Decimal) | Data validation which checks for decimal values satisfying the given condition. |
| list (List) | Data validation which checks for a value matching one of list of values. |
| none (None) | No data validation. |

| Enumeration Value | Description |
|--------------------------|---|
| textLength (Text Length) | Data validation which checks for text values, whose length satisfies the given condition. |
| time (Time) | Data validation which checks for time values satisfying the given condition. |
| whole (Whole Number) | Data validation which checks for whole number values satisfying the given condition. |

| Referenced By |
|----------------------------------|
| dataValidation@type (§18.3.1.32) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DataValidationType](#)) is located in §A.2. *end note*]

18.18.22 ST_DateTimeGrouping (Date Time Grouping)

Specifies how to group dateTime values.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|-----------------|
| day (Day) | Group by day |
| hour (Group by Hour) | Group by hour |
| minute (Group by Minute) | Group by minute |
| month (Month) | Group by month |
| second (Second) | Group by second |
| year (Group by Year) | Group by year |

| Referenced By |
|--|
| dateGroupItem@dateTimeGrouping (§18.3.2.4) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DateTimeGrouping](#)) is located in §A.2. *end note*]

18.18.23 ST_DdeValueType (DDE Value Types)

This simple type indicates the type of the DDE value.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| b (Boolean) | Indicates that the value is a boolean. |
| e (Error) | Indicates that the value is an error. |
| n (Real Number) | Indicates that the value is a real number. |
| nil (Nil) | Indicates that the value is nil. |
| str (String) | Indicates that the value is a string. |

| Referenced By |
|---------------------|
| value@t (§18.14.18) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DdeValueType](#)) is located in §A.2. *end note*]

18.18.24 ST_DvAspect (Data View Aspect Type)

Specifies the desired data or view aspect of the object when drawing or getting data.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| DVASPECT_CONTENT (Object Display Content) | Provides a representation of an object so it can be displayed as an embedded object inside of a container. |
| DVASPECT_ICON (Object Display Icon) | Provides an iconic representation of an object. |

| Referenced By |
|---------------------------------|
| oleObject@dvAspect (§18.3.1.59) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DvAspect](#)) is located in §A.2. *end note*]

18.18.25 ST_Dxfld (Format Id)

This simple type defines the identifier to CT_Dxfs in the styles part. This a zero-based index. See §18.8.30 in Style for more information on formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|--|
| cfRule@dxflid (§18.3.1.10); colorFilter@dxflid (§18.3.2.1); format@dxflid (§18.10.1.35); sortCondition@dxflid (§18.3.1.91); table@dataDxflid (§18.5.1.2); table@headerRowBorderDxflid (§18.5.1.2); table@headerRowDxflid (§18.5.1.2); table@tableBorderDxflid (§18.5.1.2); table@totalsRowBorderDxflid (§18.5.1.2); table@totalsRowDxflid (§18.5.1.2); tableColumn@dataDxflid (§18.5.1.3); tableColumn@headerRowDxflid (§18.5.1.3); tableColumn@totalsRowDxflid (§18.5.1.3); tableStyleElement@dxflid (§18.8.41) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Dxflid](#)) is located in §A.2. *end note*]

18.18.26 ST_DynamicFilterType (Dynamic Filter)

These are the dynamic filter types. A dynamic filter returns a result set which might vary due to a change in the data itself or a change in the date on which the filter is being applied. For example, for a set of data {1,1,2,3}, the aboveAverage filter would return or highlight the last two values in the set. If the data is refreshed or changed to {1,1,1,2}, then only the last value would be highlighted. Similarly, the meaning of "lastQuarter" shall be the same for the dates in January, February, and March, but shall change meaning once the date advances from March to April.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------|---|
| aboveAverage (Above Average) | Shows values that are above average. |
| belowAverage (Below Average) | Shows values that are below average. |
| lastMonth (Last Month) | Shows last month's dates. |
| lastQuarter (Last Quarter) | Shows last calendar quarter's dates. |
| lastWeek (Last Week) | Shows last week's dates, using Sunday as the first weekday. |
| lastYear (Last Year) | Shows last year's dates. |
| M1 (1st Month) | Shows the dates that are in January, regardless of year. |
| M10 (10th Month) | Shows the dates that are in October, regardless of year. |
| M11 (11th Month) | Shows the dates that are in November, regardless of year. |
| M12 (12th Month) | Shows the dates that are in December, regardless of year. |
| M2 (2nd Month) | Shows the dates that are in February, regardless of year. |

| Enumeration Value | Description |
|----------------------------|---|
| M3 (3rd Month) | Shows the dates that are in March, regardless of year. |
| M4 (4th Month) | Shows the dates that are in April, regardless of year. |
| M5 (5th Month) | Shows the dates that are in May, regardless of year. |
| M6 (6th Month) | Shows the dates that are in June, regardless of year. |
| M7 (7th Month) | Shows the dates that are in July, regardless of year. |
| M8 (8th Month) | Shows the dates that are in August, regardless of year. |
| M9 (9th Month) | Shows the dates that are in September, regardless of year. |
| nextMonth (Next Month) | Shows next month's dates. |
| nextQuarter (Next Quarter) | Shows next calendar quarter's dates. |
| nextWeek (Next Week) | Shows next week's dates, using Sunday as the first weekday. |
| nextYear (Next Year) | Shows next year's dates. |
| null (Null) | Common filter type not available. |
| Q1 (1st Quarter) | Shows the dates that are in the 1st calendar quarter, regardless of year. |
| Q2 (2nd Quarter) | Shows the dates that are in the 2nd calendar quarter, regardless of year. |
| Q3 (3rd Quarter) | Shows the dates that are in the 3rd calendar quarter, regardless of year. |
| Q4 (4th Quarter) | Shows the dates that are in the 4th calendar quarter, regardless of year. |
| thisMonth (This Month) | Shows this month's dates. |
| thisQuarter (This Quarter) | Shows this calendar quarter's dates. |
| thisWeek (This Week) | Shows this week's dates, using Sunday as the first weekday. |
| thisYear (This Year) | Shows this year's dates. |
| today (Today) | Shows today's dates. |
| tomorrow (Tomorrow) | Shows tomorrow's dates. |
| yearToDate (Year To Date) | Shows the dates between the beginning of the year and today, inclusive. |
| yesterday (Yesterday) | Shows yesterday's dates. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_DynamicFilterType](#)) is located in §A.2. *end note*]

18.18.27 ST_ExternalConnectionType (Text Field Datatype)

These are the possible data types to use when importing text into the SpreadsheetML document. Strings are converted to these data types in the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|--|
| DMY (Day Month Year) | Field contains a date in the order: day, month, year. |
| DYM (Day Year Month) | Field contains a date in the order: day, year, month. |
| EMD (East Asian Year Month Day) | Field contains an East Asian date in the order: EA era year, month, day. |
| general (General) | The SpreadsheetML application decides the best fit data type based on the content. |
| MDY (Month Day Year) | Field contains a date in the order: month, day, year. |
| MYD (Month Day Year) | Field contains a date in the order: month, year, day. |
| skip (Skip Field) | Don't import this field at all. |
| text (Text) | Field contains text. |
| YDM (Year Day Month) | Field contains a date in the order: year, day, month. |
| YMD (Year Month Day) | Field contains a date in the order: year, month, day. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ExternalConnectionType](#)) is located in §A.2. *end note*]

18.18.28 ST_FieldSortType (Field Sort Type)

This simple type defines the sort orders that can be applied to fields in a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|--|
| ascending (Ascending) | Indicates the field is sorted in ascending order. |
| descending (Descending) | Indicates the field is sorted in descending order. |

| Enumeration Value | Description |
|----------------------|---|
| manual (Manual Sort) | Indicates the field is sorted manually. |

| Referenced By |
|-----------------------------------|
| pivotField@sortType (§18.10.1.69) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FieldSortType](#)) is located in §A.2. *end note*]

18.18.29 ST_FileType (File Type)

The file type being used for text import.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------------|--|
| dos (DOS) | DOS (PC-8). |
| lin (Linux) | Linux |
| mac (Macintosh) | Macintosh. |
| other (Other Non-Specified Values) | Other non-specified values at the time of writing. |
| win (Windows (ANSI)) | Windows (ANSI). |

| Referenced By |
|-----------------------------|
| textPr@fileType (§18.13.12) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FileType](#)) is located in §A.2. *end note*]

18.18.30 ST_FillId (Fill Id)

Zero-based index used to reference a fill record.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|----------------------|
| xf@fillId (§18.8.45) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_FillId](#)) is located in §A.2. end note*]

18.18.31 ST_FilterOperator (Filter Operator)

Operator enumerations for filtering.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|---|
| equal (Equal) | Show results which are equal to criteria. |
| greaterThan (Greater Than) | Show results which are greater than criteria. |
| greaterThanOrEqualTo (Greater Than Or Equal) | Show results which are greater than or equal to criteria. |
| lessThan (Less Than) | Show results which are less than criteria. |
| lessThanOrEqualTo (Less Than Or Equal) | Show results which are less than or equal to criteria. |
| notEqual (Not Equal) | Show results which are not equal to criteria. |

| Referenced By |
|-----------------------------------|
| customFilter@operator (§18.3.2.2) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_FilterOperator](#)) is located in §A.2. end note*]

18.18.32 ST_FontId (Font Id)

An integer that represents a zero based index into the <fonts> collection in the style sheet.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|---|
| phoneticPr@fontId (§18.4.3); xf@fontId (§18.8.45) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_FontId](#)) is located in §A.2. end note*]

18.18.33 ST_FontScheme (Font scheme Styles)

Defines the font scheme, if any, to which this font belongs.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------|---|
| major (Major Font) | This font is the major font for this theme. |
| minor (Minor Font) | This font is the minor font for this theme. |
| none (None) | This font is not a theme font. |

| Referenced By |
|-----------------------|
| scheme@val (§18.8.35) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FontScheme](#)) is located in §A.2.
end note]

18.18.34 ST_FormatAction (PivotTable Format Types)

This simple type defines the type of formats that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|---|
| blank (Blank) | Indicates no format is applied to the PivotTable. This value is used when formatting is cleared from already formatted cells in the PivotTable. |
| drill (Drill Type) | Indicates the PivotTable has drill-through format. |
| formatting (Formatting) | Indicates the PivotTable has formatting. |
| formula (Formula Type) | Indicates the PivotTable has formulas. |

| Referenced By |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_FormatAction](#)) is located in §A.2.
end note]

18.18.35 ST_Formula (Formula)

A formula

This simple type's contents are a restriction of the ST_Xstring datatype (§22.9.2.19).

| Referenced By |
|---|
| calculatedColumnFormula (§18.5.1.1); controlPr@linkedCell (§18.3.1.20); controlPr@listFillRange (§18.3.1.20); controlPr@macro (§18.3.1.20); definedName (§18.2.5); f (§18.3.1.40); formula (§18.3.1.43); formula1 (§18.3.1.44); formula2 (§18.3.1.45); objectPr@macro (§18.3.1.56); oldFormula (§18.11.1.7); totalsRowFormula (§18.5.1.6) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Formula](#)) is located in §A.2. *end note*]

18.18.36 ST_FormulaExpression (Formula Expression Type)

This simple type specifies an expression type that can comprise a formula.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------|---|
| area (Area) | Reference to a range of cells. |
| areaError (Area Error) | Reference to a range of cells that now evaluates to an error. |
| computedArea (Computed Area) | Computed area reference. |
| ref (Reference) | Single cell reference. |
| refError (Reference Is Error) | Single cell reference that now evaluates to an error. |

| Referenced By |
|------------------------|
| undo@exp (§18.11.1.25) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_FormulaExpression](#)) is located in §A.2. *end note*]

18.18.37 ST_GradientType (Gradient Type)

Type of gradient fill being used, either linear or path.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|---|
| linear (Linear Gradient) | This gradient fill is of linear gradient type. Linear gradient type means that the transition from one color to the next is along a line (e.g., horizontal, vertical, |

| Enumeration Value | Description |
|-------------------|--|
| | diagonal, etc.). |
| path (Path) | This gradient fill is of path gradient type. Path gradient type means the that the boundary of transition from one color to the next is a rectangle, defined by top, bottom, left, and right attributes on the gradientFill element. |

| Referenced By |
|------------------------------|
| gradientFill@type (§18.8.24) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GradientType](#)) is located in §A.2. *end note*]

18.18.38 ST_GroupBy (Values Group By)

This simple type defines types of data grouping that can be performed on a PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|--|
| days (Days) | Indicates a grouping on "days" for date values. |
| hours (Hours) | Indicates a grouping on "hours" for date values. |
| minutes (Minutes) | Indicates a grouping on "minutes" for date values. |
| months (Months) | Indicates a grouping on "months" for date values. |
| quarters (Quarters) | Indicates a grouping on "quarters" for date values. |
| range (Group By Numeric Ranges) | Indicates a grouping by numeric ranges for numeric values. |
| seconds (Seconds) | Indicates a grouping on "seconds" for date values. |
| years (Years) | Indicates a grouping on "years" for date values. |

| Referenced By |
|-------------------------------|
| rangePr@groupBy (§18.10.1.78) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GroupBy](#)) is located in §A.2. *end note*]

18.18.39 ST_GrowShrinkType (Grow Shrink Type)

This type enumerates behavior patterns for refreshing external data in a query table.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| insertClear (Insert & Clear On Refresh) | Insert entire rows for new data, clear unused cells. |
| insertDelete (Insert & Delete On Refresh) | Insert cells for new data, delete unused cells. |
| overwriteClear (Overwrite & Clear On Refresh) | Overwrite existing cells with new data, clear unused cells. |

| Referenced By |
|--------------------------------------|
| queryTable@growShrinkType (§18.12.2) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_GrowShrinkType](#)) is located in §A.2. *end note*]

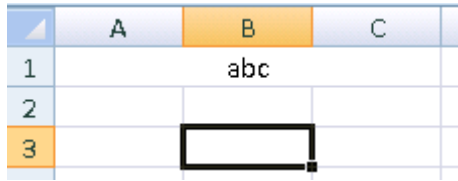

18.18.40 ST_HorizontalAlignment (Horizontal Alignment Type)

The enumeration value indicating the portion of Cell Alignment in a cell format (XF) that is horizontal alignment, i.e., whether it is aligned general, left, right, horizontally centered, filled (replicated), justified, centered across multiple cells, or distributed.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

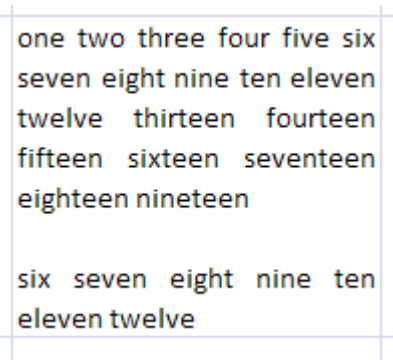

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| center (Centered Horizontal Alignment) | The horizontal alignment is centered, meaning the text is centered across the cell. |
| centerContinuous (Center Continuous Horizontal Alignment) | <p>The horizontal alignment is centered across multiple cells. The information about how many cells to span is expressed in the Sheet Part, in the row of the cell in question. For each cell that is spanned in the alignment, a cell element needs to be written out, with the same style Id which references the centerContinuous alignment.</p> <p>[Example: This shows the value of A1 centered across A1:C1:</p> |

| Enumeration Value | Description |
|--|---|
| | <div></div> <p>The XML from the Sheet Part:</p> <pre><row r="1" spans="1:3"> <c r="A1" s="1" t="s"> <v>0</v> </c> <c r="B1" s="1"/> <c r="C1" s="1"/> </row></pre> <p>The XML from the Styles Part:</p> <pre><cellXfs count="2"> <xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0"/> <xf numFmtId="0" fontId="0" fillId="0" borderId="0" xfId="0" applyAlignment="1"> <alignment horizontal="centerContinuous"/> </xf> </cellXfs></pre> <p><i>end example]</i></p> |
| distributed (Distributed Horizontal Alignment) | <p>l/ndicates that each 'word' in each line of text inside the cell is evenly distributed across the width of the cell, with flush right and left margins.</p> <p>When there is also an indent value to apply, both the left and right side of the cell are padded by the indent value.</p> <p>A 'word' is a set of characters with no space character in them.</p> <p>Two lines inside a cell are separated by a carriage return.</p> <p><i>[Example:</i> This shows three lines of text evenly distributed horizontally across the cell. The first line is</p> |

| Enumeration Value | Description | | | | | | | | | | | | | | | | | | |
|-------------------|---|-------------|---|---|---|--|-------------|---|--|---------|--|---|---|---|--|-------------|---|--|---------|
| | <p>"abc def ghi", the second line is blank, and the third line is "jkl mno".</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td>abc def ghi</td></tr><tr><td>2</td><td></td><td>jkl mno</td></tr></table> <p>This shows the same example, with an indent value of 2:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td>abc def ghi</td></tr><tr><td>2</td><td></td><td>jkl mno</td></tr></table> <p>There is no vertical component to the alignment being shown here. The row has been manually adjusted to display the text. <i>end example]</i></p> | | A | B | 1 | | abc def ghi | 2 | | jkl mno | | A | B | 1 | | abc def ghi | 2 | | jkl mno |
| | A | B | | | | | | | | | | | | | | | | | |
| 1 | | abc def ghi | | | | | | | | | | | | | | | | | |
| 2 | | jkl mno | | | | | | | | | | | | | | | | | |
| | A | B | | | | | | | | | | | | | | | | | |
| 1 | | abc def ghi | | | | | | | | | | | | | | | | | |
| 2 | | jkl mno | | | | | | | | | | | | | | | | | |
| fill (Fill) | <p>Indicates that the value of the cell should be filled across the entire width of the cell. If blank cells to the right also have the fill alignment, they are also filled with the value, using a convention similar to centerContinuous.</p> <p>Additional rules:</p> <ul style="list-style-type: none">• Only whole values can be appended, not partial values.• The column will not be widened to 'best fit' the filled value• If appending an additional occurrence of the value exceeds the boundary of the cell left/right edge, don't append the additional occurrence of the value.• The display value of the cell is filled, not the underlying raw number. <p>[Example: This cell is filled with the value 1.2345 and has a width of 15 characters:</p> | | | | | | | | | | | | | | | | | | |

| Enumeration Value | Description | | | | | | | | | | | | | | | | | | |
|--|--|------------------|-------|---|----|--|-----|---|------|--------------|--|---|---|---|--|--|---|--|------------------|
| | <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>1.23451.2345</td></tr></table> <p>This cell is filled with the value abc and has width of 15 characters:</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td>2</td><td></td><td>abccabccabccabcc</td></tr></table> <ul style="list-style-type: none">• end example]• | | A | B | 1 | | | 2 | | 1.23451.2345 | | A | B | 1 | | | 2 | | abccabccabccabcc |
| | A | B | | | | | | | | | | | | | | | | | |
| 1 | | | | | | | | | | | | | | | | | | | |
| 2 | | 1.23451.2345 | | | | | | | | | | | | | | | | | |
| | A | B | | | | | | | | | | | | | | | | | |
| 1 | | | | | | | | | | | | | | | | | | | |
| 2 | | abccabccabccabcc | | | | | | | | | | | | | | | | | |
| general (General Horizontal Alignment) | <p>The horizontal alignment is general-aligned. Text data is left-aligned. Numbers, dates, and times are right-aligned. Boolean types are centered. Changing the alignment does not change the type of data.</p> <p>[Example: These cells are general aligned:</p> <table><tr><td></td><td>1-Jan</td></tr><tr><td></td><td>45</td></tr><tr><td></td><td>abc</td></tr><tr><td></td><td>TRUE</td></tr></table> <p>end example]</p> | | 1-Jan | | 45 | | abc | | TRUE | | | | | | | | | | |
| | 1-Jan | | | | | | | | | | | | | | | | | | |
| | 45 | | | | | | | | | | | | | | | | | | |
| | abc | | | | | | | | | | | | | | | | | | |
| | TRUE | | | | | | | | | | | | | | | | | | |
| justify (Justify) | <p>The horizontal alignment is justified (flush left and right). For each line of text, aligns each line of the wrapped text in a cell to the right and left (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p>[Example: There are two lines of text in this cell, and the cell's horizontal alignment is justify:</p> | | | | | | | | | | | | | | | | | | |

| Enumeration Value | Description |
|------------------------------------|--|
| |  <p><i>end example]</i></p> |
| left (Left Horizontal Alignment) | The horizontal alignment is left-aligned, even in Right-to-Left mode. Aligns contents at the left edge of the cell. If an indent amount is specified, the contents of the cell is indented from the left by the specified number of character spaces. The character spaces are based on the default font and font size for the workbook. |
| right (Right Horizontal Alignment) | The horizontal alignment is right-aligned, meaning that cell contents are aligned at the right edge of the cell, even in Right-to-Left mode. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_HorizontalAlignment](#)) is located in §A.2. *end note*]

18.18.41 ST_HtmlFmt (HTML Formatting Handling)

How to handle formatting from the HTML source.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------|--|
| all (All) | Transfer all HTML formatting into the worksheet along with data. |
| none (No Formatting) | Bring data in as unformatted text (setting data types still occurs). |
| rtf (Honor Rich Text) | Translate HTML formatting to rich text formatting on |

| Enumeration Value | Description |
|-------------------|--------------------------------------|
| | the data brought into the worksheet. |

| Referenced By |
|------------------------------|
| webPr@htmlFormat (§18.13.13) |

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_HtmlFmt](#)) is located in §A.2. *end note*]

18.18.42 ST_IconSetType (Icon Set Type)

Icon set type for conditional formatting. The threshold values for triggering the different icons within a set are configurable, and the icon order is reversible. See element iconSet for more information.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------|--|
| 3Arrows (3 Arrows) | 3 arrows icon set.  |
| 3ArrowsGray (3 Arrows (Gray)) | 3 gray arrows icon set.  |
| 3Flags (3 Flags) | 3 flags icon set.  |
| 3Signs (3 Signs) | 3 signs icon set.  |
| 3Symbols (3 Symbols Circled) | 3 symbols icon set.  |

| Enumeration Value | Description |
|--|---|
| 3Symbols2 (3 Symbols) | 3 Symbols icon set.  |
| 3TrafficLights1 (3 Traffic Lights) | 3 traffic lights icon set (#1).  |
| 3TrafficLights2 (3 Traffic Lights Black) | 3 traffic lights icon set with thick black border.  |
| 4Arrows (4 Arrows) | 4 arrows icon set.  |
| 4ArrowsGray (4 Arrows (Gray)) | 4 gray arrows icon set.  |
| 4Rating (4 Ratings) | 4 ratings icon set.  |
| 4RedToBlack (4 Red To Black) | 4 'red to black' icon set.  |
| 4TrafficLights (4 Traffic Lights) | 4 traffic lights icon set.  |
| 5Arrows (5 Arrows) | 5 arrows icon set. |

| Enumeration Value | Description |
|-------------------------------|---|
| |  |
| 5ArrowsGray (5 Arrows (Gray)) | 5 gray arrows icon set.  |
| 5Quarters (5 Quarters) | 5 quarters icon set.  |
| 5Rating (5 Ratings Icon Set) | 5 rating icon set.  |

| Referenced By |
|--|
| iconFilter@iconSet (§18.3.2.9); iconSet@iconSet (§18.3.1.49); sortCondition@iconSet (§18.3.1.91) |

[*Note*: The W3C XML Schema definition of this simple type’s content model ([ST_IconSetType](#)) is located in §A.2.
end note]

18.18.43 ST_ItemType (PivotItem Type)

This simple type defines the pivot type for a pivotItem.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|--|
| avg (Average) | Indicates the pivot item represents an "average" aggregate function. |
| blank (Blank Pivot Item) | Indicates the pivot item represents a blank line. |
| count (Count) | Indicates the pivot item represents custom the "count" aggregate." |
| countA (CountA) | Indicates the pivot item represents the "count |

| Enumeration Value | Description |
|--------------------------|--|
| | numbers" aggregate function. |
| data (Data) | Indicate the pivot item represents data. |
| default (Default) | Indicates the pivot item represents the default type for this PivotTable. The default pivot item type is the "total" aggregate function. |
| grand (Grand Total Item) | Indicates the pivot items represents the grand total line. |
| max (Max) | Indicates the pivot item represents the "maximum" aggregate function. |
| min (Min) | Indicates the pivot item represents the "minimum" aggregate function. |
| product (Product) | Indicates the pivot item represents the "product" function. |
| stdDev (stdDev) | Indicates the pivot item represents the "standard deviation" aggregate function. |
| stdDevP (StdDevP) | Indicates the pivot item represents the "standard deviation population" aggregate function. |
| sum (Sum) | Indicates the pivot item represents the "sum" aggregate value. |
| var (Var) | Indicates the pivot item represents the "variance" aggregate value. |
| varP (VarP) | Indicates the pivot item represents the "variance population" aggregate value. |

| Referenced By |
|---|
| i@t (§18.10.1.44); item@t (§18.10.1.45) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ItemType](#)) is located in §A.2. *end note*]

18.18.44 ST_MdxFunctionType (MDX Function Type)

This simple type is an enumeration representing different MDX function types.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------|--------------|
| c (Cube Set Count) | CUBESETCOUNT |

| Enumeration Value | Description |
|--------------------------|--------------------|
| k (Cube KPI Member) | CUBEKPIMEMBER |
| m (Cube Member) | CUBEMEMBER |
| p (Cube Member Property) | CUBEMEMBERPROPERTY |
| r (Cube Ranked Member) | CUBERANKEDMEMBER |
| s (Cube Set) | CUBESET |
| v (Cube Value) | CUBEVALUE |

| Referenced By |
|-----------------|
| mdx@f (§18.9.6) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxFunctionType](#)) is located in §A.2. *end note*]

18.18.45 ST_MdxKPIProperty (MDX KPI Property)

An enumeration representing the different types of KPI properties.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|----------------------|
| g (Goal) | Goal. |
| m (Current Time Member) | Current time member. |
| s (Status) | Status. |
| t (Trend) | Trend. |
| v (Value) | Value. |
| w (Weight) | Weight. |

| Referenced By |
|---------------|
| k@p (§18.9.5) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxKPIProperty](#)) is located in §A.2. *end note*]

18.18.46 ST_MdxSetOrder (MDX Set Order)

This simple type represents an enumeration specifying an MDX set order.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------------|--|
| a (Ascending) | Sort ascending. |
| aa (Alpha Ascending Sort Order) | Sorted alphabetically in ascending order by the caption. |
| ad (Alpha Descending Sort Order) | Sort in descending order alphabetically by the caption. |
| d (Descending) | Sort descending. |
| na (Natural Ascending) | Sorted in ascending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number. |
| nd (Natural Descending) | Sorted in descending order by the natural order of the data - usually by the key. For instance if there is a list of accounts in a general ledger, this might be in order of account number. |
| u (Unsorted) | Unsorted. |

| Referenced By |
|-----------------|
| ms@o (§18.9.12) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_MdxSetOrder](#)) is located in §A.2. end note]

18.18.47 ST_NumFmtId (Number Format Id)

This simple type defines the identifier to a style sheet number format entry in CT_NumFmts. Number formats are written to the styles part. See §18.8.31 for more information on number formats.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|--|
| cacheField@numFmtId (§18.10.1.3); dataField@numFmtId (§18.10.1.22); inputCells@numFmtId (§18.3.1.52); numFmt@numFmtId (§18.8.30); pivotField@numFmtId (§18.10.1.69); rcc@numFmtId (§18.11.1.9); xf@numFmtId (§18.8.45) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_NumFmtId](#)) is located in §A.2. end note]

18.18.48 ST_Objects (Object Display Types)

This simple type defines how the application displays objects in this workbook. Objects might include charts, images, and other object data that the application supports.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------------|---|
| all (All) | Indicates that all objects be shown in the workbook. |
| none (None) | Indicates that all objects be hidden in the workbook. |
| placeholders (Show Placeholders) | Indicates that the application show placeholders for objects in the workbook. |

| Referenced By |
|---|
| customWorkbookView@showObjects (§18.2.3); workbookPr@showObjects (§18.2.28) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Objects](#)) is located in §A.2. *end note*]

18.18.49 ST_OleUpdate (OLE Update Types)

Indicates whether the linked object updates the cached data for the linked object automatically or only when the container calls IOleObject::Update or IOleLink::Update methods.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------------|---|
| OLEUPDATE_ALWAYS (Always Update OLE) | Update the link object whenever possible, this option corresponds to the 'automatic update' option in the Links dialog box. |
| OLEUPDATE_ONCALL (Update OLE On Call) | Update the link object only when IOleObject::Update or IOleLink::Update is called, this option corresponds to the Manual update option in the Links dialog box. |

| Referenced By |
|----------------------------------|
| oleObject@oleUpdate (§18.3.1.59) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_OleUpdate](#)) is located in §A.2.
end note]

18.18.50 ST_Orientation (Orientation)

Print orientation for this sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------|---|
| default (Default) | Orientation not specified, use the default. |
| landscape (Landscape) | Landscape orientation. |
| portrait (Portrait) | Portrait orientation. |

| Referenced By |
|--|
| pageSetup@orientation (§18.3.1.64); pageSetup@orientation (§18.3.1.63) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Orientation](#)) is located in §A.2.
end note]

18.18.51 ST_PageOrder (Page Order)

Specifies printed page order.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------|---|
| downThenOver (Down Then Over) | Order pages vertically first, then move horizontally. |
| overThenDown (Over Then Down) | Order pages horizontally first, then move vertically |

| Referenced By |
|----------------------------------|
| pageSetup@pageOrder (§18.3.1.63) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PageOrder](#)) is located in §A.2.
end note]

18.18.52 ST_Pane (Pane Types)

Defines the names of the four possible panes into which the view of a workbook in the application can be split.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|--|
| bottomLeft (Bottom Left Pane) | <p>Bottom left pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the bottom pane.</p> |
| bottomRight (Bottom Right Pane) | <p>Bottom right pane, when both vertical and horizontal splits are applied.</p> |
| topLeft (Top Left Pane) | <p>Top left pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a horizontal split has been applied, dividing the pane into upper and lower regions. In that case, this value specifies the top pane.</p> <p>This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the left pane</p> |
| topRight (Top Right Pane) | <p>Top right pane, when both vertical and horizontal splits are applied.</p> <p>This value is also used when only a vertical split has been applied, dividing the pane into right and left regions. In that case, this value specifies the right pane.</p> |

| Referenced By |
|---|
| pane@activePane (§18.3.1.66); pivotSelection@pane (§18.3.1.69); selection@pane (§18.3.1.78) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_Pane](#)) is located in §A.2. *end note*]

18.18.53 ST_PaneState (Pane State)

State of the sheet's pane.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|---|
| frozen (Frozen) | Panes are frozen, but were not split being frozen. In this state, when the panes are unfrozen again, a single pane results, with no split. In this state, the split bars are not adjustable. |
| frozenSplit (Frozen Split) | Panes are frozen and were split before being frozen. In this state, when the panes are unfrozen again, the split remains, but is adjustable. |
| split (Split) | Panes are split, but not frozen. In this state, the split bars are adjustable by the user. |

| Referenced By |
|-------------------------|
| pane@state (§18.3.1.66) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PaneState](#)) is located in §A.2. end note]

18.18.54 ST_ParameterType (Parameter Type)

Parameter Type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|---|
| cell (Parameter From Cell) | Get the parameter value from a cell on each refresh. |
| prompt (Prompt on Refresh) | Prompt the user on each refresh for a parameter value. |
| value (Value) | Use a constant value on each refresh for the parameter value. |

| Referenced By |
|------------------------------------|
| parameter@parameterType (§18.13.6) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ParameterType](#)) is located in §A.2. end note]

18.18.55 ST_PatternType (Pattern Type)

Indicates the style of fill pattern being used for a cell format.

The examples below use yellow background and black foreground colors.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------------|---|
| darkDown (Dark Down) | <div>The fill style is 'dark down'. [Example:  end example]</div> |
| darkGray (Dary Gray) | <div>The fill style is 'dark gray'. [Example:  end example]</div> |
| darkGrid (Dark Grid) | <div>The fill style is 'dark grid'. [Example:  end example]</div> |
| darkHorizontal (Dark Horizontal) | <div>The fill style is dark horizontal. [Example:</div> |

| Enumeration Value | Description |
|------------------------------|---|
| |  <p><i>end example]</i></p> |
| darkTrellis (Dark Trellis) | <p>The fill style is 'dark trellis'. [Example:</p>  <p><i>end example]</i></p> |
| darkUp (Dark Up) | <p>The fill style is 'dark up'. [Example:</p>  <p><i>end example]</i></p> |
| darkVertical (Dark Vertical) | <p>The fill style is 'dark vertical'. [Example:</p>  <p><i>end example]</i></p> |
| gray0625 (Gray 0.0625) | <p>The fill style is grayscale of 0.0625 (1/16) value. [Example:</p> |

| Enumeration Value | Description |
|------------------------|--|
| |  <p><i>end example]</i></p> |
| gray125 (Gray 0.125) | <p>The fill style is grayscale of 0.125 (1/8) value. [Example:</p>  <p><i>end example]</i></p> |
| lightDown (Light Down) | <p>The fill style is 'light down'. [Example:</p>  <p><i>end example]</i></p> |
| lightGray (Light Gray) | <p>The fill style is light gray. [Example:</p>  <p><i>end example]</i></p> |
| lightGrid (Light Grid) | <p>The fill style is 'light grid'. [Example:</p> |

| Enumeration Value | Description |
|------------------------------------|---|
| |  <p><i>end example]</i></p> |
| lightHorizontal (Light Horizontal) | <p>The fill style is light horizontal. [Example:</p>  <p><i>end example]</i></p> |
| lightTrellis (Light Trellis) | <p>The fill style is 'light trellis'. [Example:</p>  <p><i>end example]</i></p> |
| lightUp (Light Up) | <p>The fill style is light up. [Example:</p>  <p><i>end example]</i></p> |
| lightVertical (Light Vertical) | <p>The fill style is light vertical.</p> |
| mediumGray (Medium Gray) | <p>The fill style is medium gray. [Example:</p> |

| Enumeration Value | Description |
|-------------------|--|
| |  <i>end example]</i> |
| none (None) | <p>The fill style is none (no fill). When foreground and/or background colors are specified, a pattern of 'none' overrides and means the cell has no fill.</p> <p>[Example:</p>  <i>end example]</i> |
| solid (Solid) | <p>The fill style is solid. When solid is specified, the foreground color (fgColor) is the only color rendered, even when a background color (bgColor) is also specified.</p> <p>[Example:</p>  <i>end example]</i> |

[Note: The W3C XML Schema definition of this simple type’s content model ([ST PatternType](#)) is located in §A.2.
end note]

18.18.56 ST_PhoneticAlignment (Phonetic Alignment Types)

Phonetic alignment settings. These specify how to align the phonetic text, which represent the sounds, above the base text or base word.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|---|
| center (Center Alignment) | Center the phonetic characters over the base word, per word. |
| distributed (Distributed) | Each phonetic character is distributed above each base word character, per word. |
| left (Left Alignment) | Each phonetic character is left justified with respect to the base text., per word. |
| noControl (No Control) | Each phonetic character is left justified without respect to the base text (so it is not per word). |

| Referenced By |

| phoneticPr@alignment (§18.4.3) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PhoneticAlignment](#)) is located in §A.2. *end note*]

18.18.57 ST_PhoneticType (Phonetic Type)

Represents the different East Asian character sets that shall be used for displaying phonetic hints.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| fullwidthKatakana (Full-Width Katakana) | Full-width Katakana is used |
| halfwidthKatakana (Half-Width Katakana) | Half-width Katakana is used, this is the same Katakana character set, just half as wide so it takes up less space. |
| Hiragana (Hiragana) | Hiragana is used |
| noConversion (No Conversion) | Any characters are allowed. In this case the spreadsheet application shall leave the text as entered. |

| Referenced By |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PhoneticType](#)) is located in §A.2. end note]*

18.18.58 ST_PivotAreaType (Rule Type)

Indicates the type of rule being used to describe an area or aspect of the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------|---|
| all (All) | Refers to the whole PivotTable. |
| button (Field Button) | Refers to a field button. |
| data (Data) | Refers to something in the data area. |
| none (None) | Refers to no Pivot area. |
| normal (Normal) | Refers to a header or item. |
| origin (Origin) | Refers to the blank cells at the top-left of the PivotTable (top-left to LTR sheets, top-right for RTL sheets). |
| topEnd (Top End) | Refers to the blank cells at the top of the PivotTable, on its trailing edge (top-right for LTR sheets, top-left for RTL sheets). |

| Referenced By |

| pivotArea@type (§18.3.1.68) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_PivotAreaType](#)) is located in §A.2. end note]*

18.18.59 ST_PivotFilterType (Pivot Filter Types)

This simple type defines filters that can be applied to PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| captionBeginsWith (Caption Begins With) | Indicates the "begins with" filter for field captions. |
| captionBetween (Caption Is Between) | Indicates the "is between" filter for field captions. |
| captionContains (Caption Contains) | Indicates the "contains" filter for field captions. |
| captionEndsWith (Caption Ends With) | Indicates the "ends with" filter for field captions. |
| captionEqual (Caption Equals) | Indicates the "equal" filter for field captions. |
| captionGreaterThan (Caption Is Greater Than) | Indicates the "is greater than" filter for field captions. |
| captionGreaterThanOrEqual (Caption Is Greater Than Or Equal To) | Indicates the "is greater than or equal to" filter for field captions. |
| captionLessThan (Caption Is Less Than) | Indicates the "is less than" filter for field captions. |
| captionLessThanOrEqual (Caption Is Less Than Or Equal To) | Indicates the "is less than or equal to" filter for field captions. |
| captionNotBeginsWith (Caption Does Not Begin With) | Indicates the "does not begin with" filter for field captions. |
| captionNotBetween (Caption Is Not Between) | Indicates the "is not between" filter for field captions. |
| captionNotContains (Caption Does Not Contain) | Indicates the "does not contain" filter for field captions. |
| captionNotEndsWith (Caption Does Not End With) | Indicates the "does not end with" filter for field captions. |
| captionNotEqual (Caption Not Equal) | Indicates the "not equal" filter for field captions. |
| count (Count) | Indicates the "count" filter. |
| dateBetween (Date Between) | Indicates the "between" filter for date values. |
| dateEqual (Date Equals) | Indicates the "equals" filter for date values. |
| dateNewerThan (Date Newer Than) | Indicates the "newer than" filter for date values. |
| dateNewerThanOrEqual (Date Newer Than or Equal To) | Indicates the "newer than or equal to" filter for date values. |
| dateNotBetween (Date Not Between) | Indicates the "not between" filter for date values. |
| dateNotEqual (Date Does Not Equal) | Indicates the "does not equal" filter for date values. |
| dateOlderThan (Date Older Than) | Indicates the "older than" filter for date values. |
| dateOlderThanOrEqual (Date Older Than Or Equal) | Indicates the "older than or equal to" filter for date values. |
| lastMonth (Last Month) | Indicates the "last month" filter for date values. |
| lastQuarter (Last Quarter) | Indicates the "last quarter" filter for date values. |
| lastWeek (Last Week) | Indicates the "last week" filter for date values. |
| lastYear (Last Year) | Indicates the "last year" filter for date values. |
| M1 (January) | Indicates the "January" filter for date values. |

| Enumeration Value | Description |
|---------------------------------------|--|
| M10 (Dates in October) | Indicates the "October" filter for date values. |
| M11 (Dates in November) | Indicates the "November" filter for date values. |
| M12 (Dates in December) | Indicates the "December" filter for date values. |
| M2 (Dates in February) | Indicates the "February" filter for date values. |
| M3 (Dates in March) | Indicates the "March" filter for date values. |
| M4 (Dates in April) | Indicates the "April" filter for date values. |
| M5 (Dates in May) | Indicates the "May" filter for date values. |
| M6 (Dates in June) | Indicates the "June" filter for date values. |
| M7 (Dates in July) | Indicates the "July" filter for date values. |
| M8 (Dates in August) | Indicates the "August" filter for date values. |
| M9 (Dates in September) | Indicates the "September" filter for date values. |
| nextMonth (Next Month) | Indicates the "next month" filter for date values. |
| nextQuarter (Next Quarter) | Indicates the "next quarter" for date values. |
| nextWeek (Next Week) | Indicates the "next week" for date values. |
| nextYear (Next Year) | Indicates the "next year" filter for date values. |
| percent (Percent) | Indicates the "percent" filter for numeric values. |
| Q1 (First Quarter) | Indicates the "first quarter" filter for date values. |
| Q2 (Second Quarter) | Indicates the "second quarter" filter for date values. |
| Q3 (Third Quarter) | Indicates the "third quarter" filter for date values. |
| Q4 (Fourth Quarter) | Indicates the "fourth quarter" filter for date values. |
| sum (Sum) | Indicates the "sum" filter for numeric values. |
| thisMonth (This Month) | Indicates the "this month" filter for date values. |
| thisQuarter (This Quarter) | Indicates the "this quarter" filter for date values. |
| thisWeek (This Week) | Indicates the "this week" filter for date values. |
| thisYear (This Year) | Indicate the "this year" filter for date values. |
| today (Today) | Indicates the "today" filter for date values. |
| tomorrow (Tomorrow) | Indicates the "tomorrow" filter for date values. |
| unknown (Unknown) | Indicates the PivotTable filter is unknown to the application. |
| valueBetween (Value Between) | Indicates the "Value between" filter for text and numeric values. |
| valueEqual (Value Equal) | Indicates the "value equal" filter for text and numeric values. |
| valueGreaterThan (Value Greater Than) | Indicates the "value greater than" filter for text and numeric values. |

| Enumeration Value | Description |
|--|--|
| valueGreaterThanOrEqual (Value Greater Than Or Equal To) | Indicates the "value greater than or equal to" filter for text and numeric values. |
| valueLessThan (Value Less Than) | Indicates the "value less than" filter for text and numeric values. |
| valueLessThanOrEqual (Value Less Than Or Equal To) | Indicates the "value less than or equal to" filter for text and numeric values |
| valueNotBetween (Value Not Between) | Indicates the "value not between" filter for text and numeric values. |
| valueNotEqual (Value Not Equal) | Indicates the "value not equal" filter for text and numeric values. |
| yearToDate (Year-To-Date) | Indicates the "year-to-date" filter for date values. |
| yesterday (Yesterday) | Indicates the "yesterday" filter for date values. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PivotFilterType](#)) is located in §A.2. *end note*]

18.18.60 ST_PrintError (Print Errors)

This enumeration specifies how to display cells with errors when printing the worksheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------------|---|
| blank (Show Cell Errors As Blank) | Display cell errors as blank. |
| dash (Dash Cell Errors) | Display cell errors as dashes. |
| displayed (Display Cell Errors) | Display cell errors as displayed on screen. |
| NA (NA) | Display cell errors as #N/A. |

| Referenced By |
|-------------------------------|
| pageSetup@errors (§18.3.1.63) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintError](#)) is located in §A.2. *end note*]

18.18.61 ST_Qualifier (Qualifier)

Qualifier to use to denote string data types in when text is imported from an external file.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|--------------------------------------|
| doubleQuote (Double Quote) | Quotation mark -- double quote ("). |
| none (No Text Qualifier) | No text string qualifier used. |
| singleQuote (Single Quote) | Apostrophe mark -- single quote ('). |

| Referenced By |
|------------------------------|
| textPr@qualifier (§18.13.12) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Qualifier](#)) is located in §A.2. *end note*]

18.18.62 ST_Ref (Cell References)

This simple type defines a reference to a range of cells within a sheet in the workbook. A reference identifies a cell or a range of cells on a worksheet and tells the application where to look for the values or data you want to use in a formula. With references, you can use data contained in different parts of a worksheet in one formula or use the value from one cell in several formulas. You can also refer to cells on other sheets in the same workbook, and to other workbooks. References to cells in other workbooks are called links.

SpreadsheetML defines two reference styles defined in the ST_RefMode simple type.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |

| autoFilter@ref (§18.3.1.2); comment@ref (§18.7.3); dataRef@ref (§18.3.1.30); dimension@ref (§18.3.1.35); f@ref (§18.3.1.40); hyperlink@ref (§18.3.1.47); location@ref (§18.10.1.49); mergeCell@ref (§18.3.1.54); oleSize@ref (§18.2.16); pivotArea@offset (§18.3.1.68); raf@ref (§18.11.1.8); rangeSet@ref (§18.10.1.79); rm@destination (§18.11.1.19); rm@source (§18.11.1.19); rqt@ref (§18.11.1.20); rrc@ref (§18.11.1.21); sheetPr@syncRef (§18.3.1.82); sortCondition@ref (§18.3.1.91); sortState@ref (§18.3.1.92); ST_Sqref (§18.18.76); table@ref (§18.5.1.2); webPublishItem@sourceRef (§18.3.1.97); worksheetSource@ref (§18.10.1.95) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Ref](#)) is located in §A.2. *end note*]

18.18.63 ST_RefA (Single Cell Reference)

This simple type specifies a single cell reference that might be absolute.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |
|-----------------------|
| undo@dr (§18.11.1.25) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RefA](#)) is located in §A.2. *end note*]

18.18.64 ST_RefMode (Reference Mode)

This simple type defines the supported reference styles or modes for a workbook in SpreadsheetML.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|--|
| A1 (A1 Mode) | Indicates that the workbook uses A1 reference style. This is the default for SpreadsheetML. A1 reference style refers to columns with letters and refers to rows with numbers. For example, A1 refers to the cell at the intersection of column A and row 1. |
| R1C1 (R1C1 Reference Mode) | Indicates that the workbook uses the R1C1 reference style. R1C1 reference style refers to both the rows and the columns on the worksheet with numbers. The location of a cell is indicated with an "R" followed by a row number and a "C" followed by a column number. For example, R1C1 refers to the cell at the intersection of row R1 and column C1. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RefMode](#)) is located in §A.2. *end note*]

18.18.65 ST_RevisionAction (Revision Action Types)

Identifies what kind of action the user performed. Applies to Comment and Custom View revision record.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|----------------|
| add (Add) | Add action. |
| delete (Delete) | Delete action. |

| Referenced By |
|---|
| rcmt@action (§18.11.1.11); rcv@action (§18.11.1.12) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_RevisionAction](#)) is located in §A.2. *end note*]

18.18.66 ST_rwColActionType (Row Column Action Type)

Identifies what kind of an action was applied to a row or column.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|-------------------------|
| deleteCol (Delete Column) | Column delete revision. |
| deleteRow (Delete Row) | Row delete revision. |
| insertCol (Column Insert) | Column insert revision. |
| insertRow (Insert Row) | Row insert revision. |

| Referenced By |
|--------------------------|
| rrc@action (§18.11.1.21) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_rwColActionType](#)) is located in §A.2. *end note*]

18.18.67 ST_Scope (Conditional Formatting Scope)

This simple type defines the scope of conditional formatting applied in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------|---|
| data (Data Fields) | Indicates that conditional formatting is applied to the |

| Enumeration Value | Description |
|-----------------------------|--|
| | selected data fields. |
| field (Field Intersections) | Indicates that conditional formatting is applied to the selected PivotTable field intersections. |
| selection (Selection) | Indicates that conditional formatting is applied to the selected cells. |

| Referenced By |
|---------------------------------------|
| conditionalFormat@scope (§18.10.1.18) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Scope](#)) is located in §A.2. *end note*]

18.18.68 ST_SheetState (Sheet Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|--|
| hidden (Hidden) | Indicates the workbook window is hidden, but can be shown by the user via the user interface. |
| veryHidden (Very Hidden) | Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically. |
| visible (Visible) | Indicates the sheet is visible. |

| Referenced By |
|--|
| customSheetView@state (§18.3.1.24); customSheetView@state (§18.3.1.25); sheet@state (§18.2.19) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SheetState](#)) is located in §A.2. *end note*]

18.18.69 ST_SheetViewType (Sheet View Type)

Defines the view setting of the sheet.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------------|--------------------|
| normal (Normal View) | Normal view |
| pageBreakPreview (Page Break Preview) | Page break preview |
| pageLayout (Page Layout View) | Page Layout View |

| Referenced By |
|--|
| customSheetView@view (§18.3.1.25); sheetView@view (§18.3.1.87) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SheetViewType](#)) is located in §A.2. end note]

18.18.70 ST_ShowDataAs (Show Data As)

This simple type defines the data formats for a field in the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------------|---|
| difference (Difference) | Indicates the field is shown as the "difference from" a value. |
| index (Index) | Indicates the field is shown as the "index." |
| normal (Normal Data Type) | Indicates that the field is shown as its normal data type. |
| percent (Percentage Of) | Indicates the field is show as the "percentage of |
| percentDiff (Percentage Difference) | Indicates the field is shown as the "percentage difference from" a value. |
| percentOfCol (Percent of Column) | Indicates the field is shown as the percentage of column. |
| percentOfRow (Percentage of Row) | Indicates the field is shown as the percentage of row |
| percentOfTotal (Percentage of Total) | Indicates the field is shown as percentage of total. |
| runTotal (Running Total) | Indicates the field is shown as running total in the table. |

| Referenced By |
|------------------------------------|
| dataField@showDataAs (§18.10.1.22) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_ShowDataAs](#)) is located in §A.2. end note]

18.18.71 ST_SmartTagShow (Smart Tag Display Types)

This simple type defines options for displaying smart tags in the user interface.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------------|---|
| all (All) | Indicates that smart tags are enabled and shown in the user interface. |
| noIndicator (No Smart Tag Indicator) | Indicates that the smart tags are enabled but the indicator not be shown in the user interface. |
| none (None) | Indicates that smart tags are disabled and not displayed in the user interface. |

| Referenced By |
|----------------------------|
| smartTagPr@show (§18.2.21) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SmartTagShow](#)) is located in §A.2. end note]

18.18.72 ST_SortBy (Sort By)

Specifies what to sort by. In many cases a range of cells are sorted by their values. However, cells can also be sorted by their background color, font color, and type of icon in the cell.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|--------------------|
| cellColor (Sort by Cell Color) | Sort by cell color |
| fontColor (Sort by Font Color) | Sort by font color |
| icon (Sort by Icon) | Sort by icon |
| value (Value) | Sort by value |

| Referenced By |
|-----------------------------------|
| sortCondition@sortBy (§18.3.1.91) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_SortBy](#)) is located in §A.2. *end note*]

18.18.73 ST_SortMethod (Sort Method)

Sort method. Chinese Simplified, Chinese Traditional, and Japanese support alternate sort methods (multiple sort options are available). All other languages support only 1 sort option. In that case, the value `pinYin` is used.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------------|--|
| <code>none</code> (None) | Not specified, use default sort method. |
| <code>pinYin</code> (PinYin Sort) | Default sort method. This is the only sort option for most languages. For Chinese Simplified, Chinese Traditional, and Japanese, <code>pinYin</code> means sort by phonetic value. • |
| <code>stroke</code> (Sort by Stroke) | Sort by stroke count of the characters. Only applies to Chinese Simplified, Chinese Traditional, and Japanese. |

| Referenced By |
|--|
| <code>sortState@sortMethod</code> (§18.3.1.92) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_SortMethod](#)) is located in §A.2. *end note*]

18.18.74 ST_SortType (Set Sort Order)

This simple type defines the possible sort order for the PivotTable.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| <code>ascending</code> (Ascending) | Indicates that the PivotTable data is sorted in ascending order. |
| <code>ascendingAlpha</code> (Ascending Alpha) | Indicates that the PivotTable data is sorted in alphabetic order with ascending values. |
| <code>ascendingNatural</code> (Ascending Natural) | Indicates that the PivotTable data is sorted in natural order with ascending. |

| Enumeration Value | Description |
|---|--|
| descending (Descending) | Indicates that the PivotTable data is sorted in descending. |
| descendingAlpha (Alphabetic Order Descending) | Indicates that the PivotTable data is sorted in alphabetic order with descending values. |
| descendingNatural (Natural Order Descending) | Indicates that the PivotTable data is sorted in natural order with descending values. |
| none (None) | Indicates that the PivotTable data is not sorted. |

| Referenced By |
|----------------------------|
| set@sortType (§18.10.1.88) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SortType](#)) is located in §A.2. *end note*]

18.18.75 ST_SourceType (PivotCache Type)

This simple type defines the cache types for PivotTables.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------------|--|
| consolidation (Consolidation Ranges) | Indicates that the cache contains data that consolidates ranges. |
| external (External) | Indicates that the cache contains data from an external data source. |
| scenario (Scenario Summary Report) | Indicates that the cache contains a scenario summary report |
| worksheet (Worksheet) | Indicates that the cache contains worksheet data. |

| Referenced By |
|-------------------------------|
| cacheSource@type (§18.10.1.7) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SourceType](#)) is located in §A.2. *end note*]

18.18.76 ST_Sqref (Reference Sequence)

A sequence of cell references, space delimited.

This simple type allows a list of items of the ST_Ref simple type (§18.18.62).

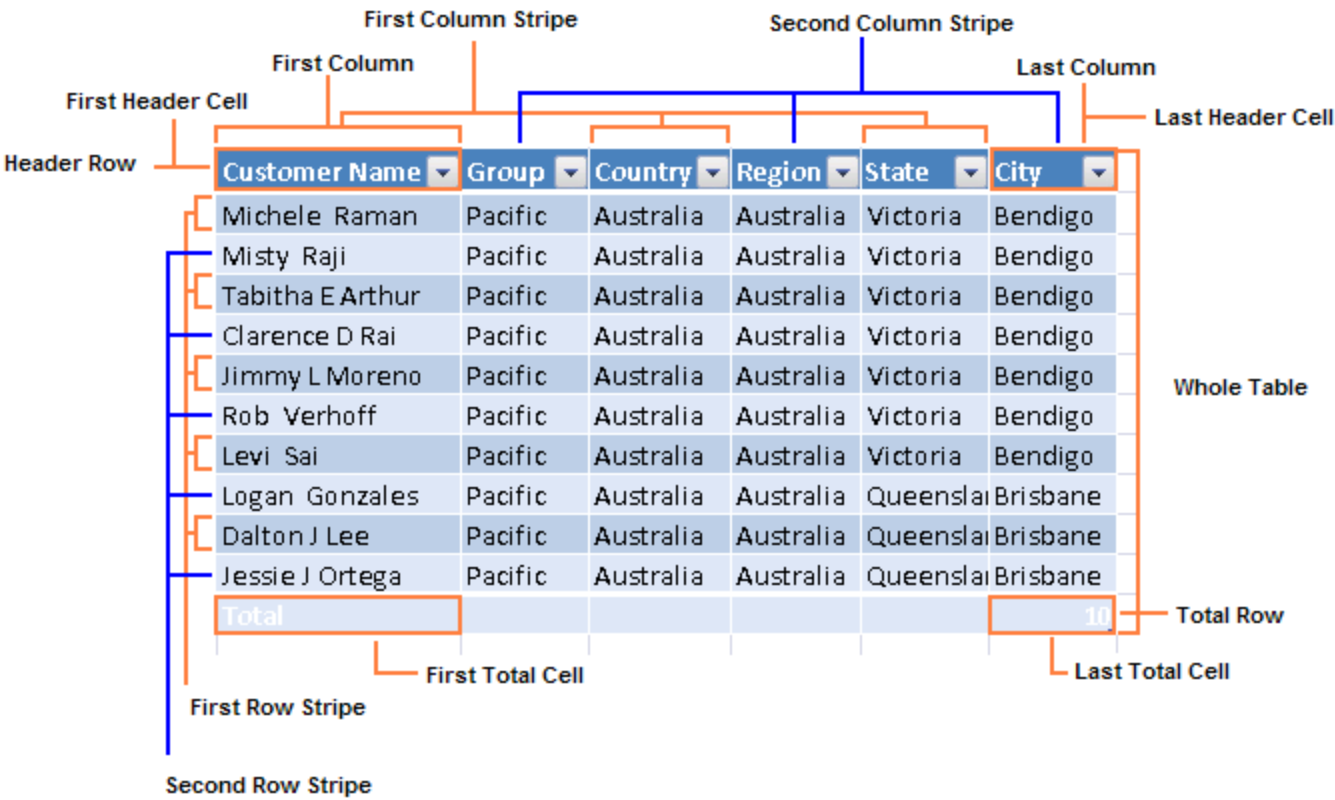

| Referenced By |
|---|
| conditionalFormatting@sqref (§18.3.1.18); dataValidation@sqref (§18.3.1.32); ignoredError@sqref (§18.3.1.50); protectedRange@sqref (§18.3.1.71); rfmt@sqref (§18.11.1.17); scenarios@sqref (§18.3.1.76); selection@sqref (§18.3.1.78) |

[Note: The W3C XML Schema definition of this simple type’s content model (ST_Sqref) is located in §A.2. *end note*]

18.18.77 ST_TableStyleType (Table Style Type)

Enumeration of the different structured regions of a Table or PivotTable which can be formatted. Specifies which region is being formatted by this table style element.

Table Regions

PivotTable Regions

Blank Row

Only applies when "Insert blank row after each item" is ON.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| blankRow (Blank Row Style) | Table style element that applies to PivotTable's blank rows. |
| firstColumn (First Column Style) | Table style element that applies to table's first column. |
| firstColumnStripe (First Column Stripe Style) | Table style element that applies to table's first column stripes. |
| firstColumnSubheading (First Column Subheading Style) | Table style element that applies to PivotTable's first column subheading. |
| firstHeaderCell (First Header Row Style) | Table style element that applies to table's first header row cell. |
| firstRowStripe (First Row Stripe Style) | Table style element that applies to table's first row stripes. |
| firstRowSubheading (First Row Subheading Style) | Table style element that applies to PivotTable's first row subheading. |
| firstSubtotalColumn (First Subtotal Column Style) | Table style element that applies to PivotTable's first subtotal column. |
| firstSubtotalRow (First Subtotal Row Style) | Table style element that applies to pivot table's first subtotal row. |
| firstTotalCell (First Total Row Style) | Table style element that applies to table's first total row cell. |

| Enumeration Value | Description |
|---|---|
| headerRow (Header Row Style) | Table style element that applies to table's header row. |
| lastColumn (Last Column Style) | Table style element that applies to table's last column. |
| lastHeaderCell (Last Header Style) | Table style element that applies to table's last header row cell. |
| lastTotalCell (Last Total Row Style) | Table style element that applies to table's last total row cell. |
| pageFieldLabels (Page Field Labels Style) | Table style element that applies to pivot table's page field labels. |
| pageFieldValues (Page Field Values Style) | Table style element that applies to pivot table's page field values. |
| secondColumnStripe (Second Column Stipe Style) | Table style element that applies to table's second column stripes. |
| secondColumnSubheading (Second Column Subheading Style) | Table style element that applies to pivot table's second column subheading. |
| secondRowStripe (Second Row Stripe Style) | Table style element that applies to table's second row stripes. |
| secondRowSubheading (Second Row Subheading Style) | Table style element that applies to pivot table's second row subheading. |
| secondSubtotalColumn (Second Subtotal Column Style) | Table style element that applies to PivotTable's second subtotal column. |
| secondSubtotalRow (Second Subtotal Row Style) | Table style element that applies to PivotTable's second subtotal row. |
| thirdColumnSubheading (Third Column Subheading Style) | Table style element that applies to PivotTable's third column subheading. |
| thirdRowSubheading (Third Row Subheading Style) | Table style element that applies to PivotTable's third row subheading. |
| thirdSubtotalColumn (Third Subtotal Column Style) | Table style element that applies to pivot table's third subtotal column. |
| thirdSubtotalRow (Third Subtotal Row Style) | Table style element that applies to PivotTable's third subtotal row. |
| totalRow (Total Row Style) | Table style element that applies to table's total row. |
| wholeTable (Whole Table Style) | Table style element that applies to table's entire content. |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TableStyleType](#)) is located in §A.2. *end note*]

18.18.78 ST_TableType (Table Type)

An enumeration that specifies what the table data is based on.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|--|
| queryTable (Query Table) | A table based on an external data query. |
| worksheet (Worksheet) | A table based on a worksheet data range. |
| xml (XML) | A table based on an XML mapping. |

| Referenced By |
|-----------------------------|
| table@tableType (§18.5.1.2) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TableType](#)) is located in §A.2. *end note*]

18.18.79 ST_TargetScreenSize (Target Screen Size Types)

This simple type defines the collection of screen resolutions that are supported for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------------|--|
| 1024x768 (1024 x 768 Resolution) | Sets the target screen resolution to 1024x768 pixels. |
| 1152x882 (1152 x 882 Resolution) | Sets the target screen resolution to 1152x882 pixels. |
| 1152x900 (1152 x 900 Resolution) | Sets the target screen resolution to 1152x900 pixels. |
| 1280x1024 (1280 x 1024 Resolution) | Sets the target screen resolution to 1280x1024 pixels. |
| 1600x1200 (1600 x 1200 Resolution) | Sets the target screen resolution to 1600x1200 pixels. |
| 1800x1440 (1800 x 1440 Resolution) | Sets the target screen resolution to 1800x1440 pixels. |
| 1920x1200 (1920 x 1200 Resolution) | Sets the target screen resolution to 1920x1200 pixels. |
| 544x376 (544 x 376 Resolution) | Sets the target screen resolution to 544x376 pixels. |
| 640x480 (640 x 480 Resolution) | Sets the target screen resolution to 640x480 pixels. |
| 720x512 (720 x 512 Resolution) | Sets the target screen resolution to 720x512 pixels. |
| 800x600 (800 x 600 Resolution) | Sets the target screen resolution to 800x600 pixels. |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TargetScreenSize](#)) is located in §A.2. *end note*]

18.18.80 ST_TextHAlign (Comment Text Horizontal Alignment)

This simple type specifies the horizontal alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|--|
| center (Center Alignment) | Specifies that the text is centered horizontally. |
| distributed (Distributed Alignment) | Specifies that the text is distributed horizontally. |
| justify (Justify Alignment) | Specifies that the text is justified horizontally. |
| left (Left Alignment) | Specifies that the text is left-aligned. |
| right (Right Alignment) | Specifies that the text is right-aligned. |

| Referenced By |

| commentPr@textHAlign (§18.7.5) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TextHAlign](#)) is located in §A.2. *end note*]

18.18.81 ST_TextVAlign (Comment Text Vertical Alignment)

This simple type specifies the vertical alignment of the text within a comment text field.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|--|
| bottom (Bottom Alignment) | Specifies that the text is bottom-aligned. |
| center (Center Alignment) | Specifies that the text is centered vertically. |
| distributed (Distributed Alignment) | Specifies that the text is distributed vertically. |
| justify (Justify Alignment) | Specifies that the text is justified vertically. |

| Enumeration Value | Description |
|---------------------|---|
| top (Top Alignment) | Specifies that the text is top-aligned. |

| Referenced By |

| commentPr@textVAlign (§18.7.5) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TextVAlign](#)) is located in §A.2.
end note]

18.18.82 ST_TimePeriod (Time Period Types)

Used in a "contains dates" conditional formatting rule. These are dynamic time periods, which change based on the date the conditional formatting is refreshed / applied.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|--|
| last7Days (Last 7 Days) | A date in the last seven days. |
| lastMonth (Last Month) | A date occurring in the last calendar month. |
| lastWeek (Last Week) | A date occurring last week. |
| nextMonth (Next Month) | A date occurring in the next calendar month. |
| nextWeek (Next Week) | A date occurring next week. |
| thisMonth (This Month) | A date occurring in this calendar month. |
| thisWeek (This Week) | A date occurring this week. |
| today (Today) | Today's date. |
| tomorrow (Tomorrow) | Tomorrow's date. |
| yesterday (Yesterday) | Yesterday's date. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TimePeriod](#)) is located in §A.2.
end note]

18.18.83 ST_TotalsRowFunction (Totals Row Function Types)

An enumeration that specifies what function is used to aggregate the data in a column before it is displayed in the totals row.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------|--|
| average (Average) | Represents the arithmetic mean. |
| count (Non Empty Cell Count) | Represents a count of the number of non-empty cells. |
| countNums (Count Numbers) | Represents the number of cells that contain numbers. |
| custom (Custom Formula) | Represents the formula provided in totalsRowFormula. |
| max (Maximum) | Represents the largest value. |
| min (Minimum) | Represents the smallest value. |
| none (None) | No total row. |
| stdDev (StdDev) | Represents the estimated standard deviation. |
| sum (Sum) | Represents the arithmetic sum. |
| var (Var) | Represents the estimated variance. |

| Referenced By |
|---|
| tableColumn@totalsRowFunction (§18.5.1.3) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TotalsRowFunction](#)) is located in §A.2. end note]

18.18.84 ST_Type (Top N Evaluation Type)

This simple type defines the values for the Top N conditional formatting evaluation for the PivotTable. For more information on Top N conditional formatting, see the Sheet (§18.3.1) reference material.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------|---|
| all (All) | Indicates that Top N conditional formatting is evaluated across the entire scope range. |
| column (Column Top N) | Indicates that Top N conditional formatting is evaluated for each column. |

| Enumeration Value | Description |
|-------------------|--|
| none (Top N None) | Indicates that Top N conditional formatting is not evaluated |
| row (Row Top N) | Indicates that Top N conditional formatting is evaluated for each row. |

| Referenced By |

| conditionalFormat@type (§18.10.1.18) |

[Note: The W3C XML Schema definition of this simple type's content model (ST_Type) is located in §A.2. *end note*]

18.18.85 ST_UnderlineValues (Underline Types)

Represents the different types of possible underline formatting.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--|
| double (Double Underline) | Double-line underlining under each character in the cell. underlines are drawn through the descenders of characters such as g and p.  |
| doubleAccounting (Accounting Double Underline) | Double-line accounting underlining under each character in the cell. The underlines are drawn under the descenders of characters such as g and p.  |
| none (None) | No underline. |
| single (Single Underline) | Single-line underlining under each character in the cell. The underline is drawn through the descenders of characters such as g and p.  |
| singleAccounting (Accounting Single Underline) | Single-line accounting underlining under each character in the cell. The underline is drawn under the descenders of characters such as g and p.  |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UnderlineValues](#)) is located in §A.2. *end note*]

18.18.86 ST_UnsignedIntHex (Hex Unsigned Integer)

This simple type represents the Hex representation of an unsigned integer.

This simple type's contents are a restriction of the W3C XML Schema hexBinary datatype.

This simple type also specifies the following restrictions:

- This simple type's contents have a length of exactly 8 hexadecimal digit(s).

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UnsignedIntHex](#)) is located in §A.2. *end note*]

18.18.87 ST_UpdateLinks (Update Links Behavior Types)

This simple type defines when the application updates links to other workbooks when the workbook is opened.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------|--|
| always (Always Update Links) | Indicates that links to other workbooks are always updated when the workbook is opened. The application will not display an alert in the user interface (UI). |
| never (Never Update Links) | Indicates that links to other workbooks are never updated when the workbook is opened. The application will not display an alert in the user interface. |
| userSet (User Set) | Indicates that the end-user specified whether they receive an alert to update links to other workbooks when the workbook is opened. [Example: The application can expose this option in an application settings dialog. <i>end example</i>] |

| Referenced By |
|-----------------------------------|
| workbookPr@updateLinks (§18.2.28) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_UpdateLinks](#)) is located in §A.2.
end note]

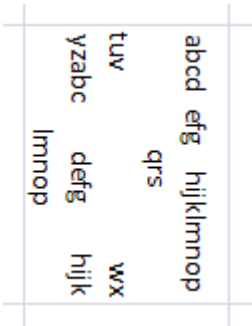

18.18.88 ST_VerticalAlignment (Vertical Alignment Types)

This enumeration value indicates the type of vertical alignment for a cell, i.e., whether it is aligned top, bottom, vertically centered, justified or distributed.

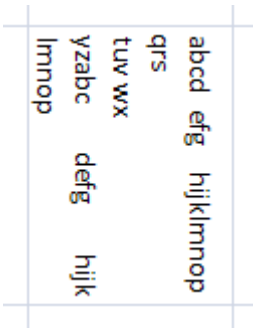

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--|
| bottom (Aligned To Bottom) | The vertical alignment is aligned-to-bottom. |
| center (Centered Vertical Alignment) | The vertical alignment is centered across the height of the cell. |
| distributed (Distributed Vertical Alignment) | <p>When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top and bottom margins.</p> <p>When text direction is vertical: behaves exactly as distributed horizontal alignment. The first words in a line of text (appearing at the top of the cell) are flush with the top edge of the cell, and the last words of a line of text are flush with the bottom edge of the cell, and the line of text is distributed evenly from top to bottom.</p> <p><i>[Example: Horizontal text: this first example shows four lines of text (read horizontally from left to right) distributed vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</i></p> |

| Enumeration Value | Description |
|--------------------------------|---|
| | <div></div> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p> <div></div> <p><i>end example]</i></p> |
| justify (Justified Vertically) | <p>When text direction is horizontal: the vertical alignment of lines of text is distributed vertically, where each line of text inside the cell is evenly distributed across the height of the cell, with flush top</p> |

| Enumeration Value | Description | | | | | | | | | | | | | | | | | | |
|-------------------|---|-----|---|---|---|--|--|--|--|-----|--|--|-----|--|--|-----|---|--|-----|
| | <p>and bottom margins.</p> <p>When text direction is vertical: similar behavior as horizontal justification. The alignment is justified (flush top and bottom in this case). For each line of text, each line of the wrapped text in a cell is aligned to the top and bottom (except the last line). If no single line of text wraps in the cell, then the text is not justified.</p> <p>[<i>Example:</i> Horizontal text: this first example shows four lines of text (read horizontally from left to right) justified vertically across the height of the cell. The first line is "abc", the second line is "def", the third line is "ghi" and the fourth line is "jkl".</p> <table><tr><td></td><td>A</td><td>B</td></tr><tr><td>1</td><td></td><td></td></tr><tr><td></td><td></td><td>abc</td></tr><tr><td></td><td></td><td>def</td></tr><tr><td></td><td></td><td>ghi</td></tr><tr><td>2</td><td></td><td>jkl</td></tr></table> <p>Vertical text: this second example shows three lines of text (read vertically from top to bottom) distributed vertically across the height of the cell. The lines of text are:</p> <p>abcd efg hijklmnop qrs tuv wx yzabc defg hijk lmnop</p> <p>The rendering looks like this:</p> | | A | B | 1 | | | | | abc | | | def | | | ghi | 2 | | jkl |
| | A | B | | | | | | | | | | | | | | | | | |
| 1 | | | | | | | | | | | | | | | | | | | |
| | | abc | | | | | | | | | | | | | | | | | |
| | | def | | | | | | | | | | | | | | | | | |
| | | ghi | | | | | | | | | | | | | | | | | |
| 2 | | jkl | | | | | | | | | | | | | | | | | |

| Enumeration Value | Description |
|-------------------|---|
| |  <p><i>end example]</i></p> |
| top (Align Top) | The vertical alignment is aligned-to-top. |

| Referenced By |

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_VericalAlignment](#)) is located in §A.2. *end note*]

18.18.89 ST_Visibility (Visibility Types)

This simple type defines the possible states for sheet visibility.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------|--|
| hidden (Hidden) | Indicates the workbook window is hidden, but can be shown by the user via the user interface. |
| veryHidden (Very Hidden) | Indicates the sheet is hidden and cannot be shown in the user interface (UI). This state is only available programmatically. |
| visible (Visible) | Indicates the workbook window is visible. |

| Referenced By |
|------------------------------------|
| workbookView@visibility (§18.2.30) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_Visibility](#)) is located in §A.2. end note*]

18.18.90 ST_VolDepType (Volatile Dependency Types)

This simple type defines the dependency types available for this workbook.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------|--|
| olapFunctions (OLAP Formulas) | Indicates that the type is Cube Functions. |
| realTimeData (Real Time Data) | Indicates that the type is Real Time Data (RTD). |

| Referenced By |
|-------------------------|
| volType@type (§18.15.5) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_VolDepType](#)) is located in §A.2. end note*]

18.18.91 ST_VolValueType (Volatile Dependency Value Types)

This simple type defines the data type of the values in the dependency cache.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---|
| b (Boolean) | Indicates topic value is a boolean. |
| e (Error) | Indicates topic value is an error. |
| n (Real Number) | Indicates topic value is a real number. |
| s (String) | Indicates topic value is a string. |

| Referenced By |
|-----------------|
| tp@t (§18.15.3) |

[*Note: The W3C XML Schema definition of this simple type's content model ([ST_VolValueType](#)) is located in §A.2. end note*]

18.18.92 ST_WebSourceType (Web Source Type)

This is an enumeration of types of objects which can be selected from the workbook to be published as HTML. For example, the entire sheet can be published, or a narrower set of objects on the sheet can be published, like a chart or a range.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|------------------------|
| autoFilter (AutoFilter) | Auto filter |
| chart (Chart) | Chart |
| label (Label) | Label |
| pivotTable (PivotTable) | PivotTable |
| printArea (Print Area) | Print area |
| query (QueryTable) | Query Table |
| range (Range) | Range of cells |
| sheet (All Sheet Content) | All content of a sheet |

| Referenced By |
|--|
| webPublishItem@sourceType (§18.3.1.97) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_WebSourceType](#)) is located in §A.2. *end note*]

18.18.93 ST_XmlDataType (XML Data Types)

Represents a W3C XML built-in datatype name (<http://www.w3.org/TR/xmlschema-2/>). The values permitted by this type are the names of the simple datatypes defined by the XMLSchema Library, <http://www.w3.org/2001/XMLSchema-datatypes>.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_XmlDataType](#)) is located in §A.2. *end note*]

18.18.94 ST_FontFamily (Font Family)

This simple type specifies a font family. A font family is a set of fonts having common stroke width and serif characteristics. This is system-level font information.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type is restricted to the values listed in the following table:

| Value | Font Family |
|-------|-------------------------|
| 0 | Not applicable. |
| 1 | Roman |
| 2 | Swiss |
| 3 | Modern |
| 4 | Script |
| 5 | Decorative |
| 6 | Reserved for future use |
| 7 | Reserved for future use |

End of informative text.

19.2 Presentation

The Presentation portion of the PresentationML framework houses a set of elements that describe the storing of presentation-wide and view-specific properties. The presentation-wide properties are those that pertain to the entire presentation. The view-specific properties assist the generating application and viewing application by storing parameters that pertain to the final delivery of the presentation.

19.2.1 Presentation Properties

This section contains all presentation-level properties that pertain to a presentation document:

19.2.1.1 bold (Bold Embedded Font)

This element specifies a bold embedded font that is linked to a parent typeface. Once specified, this bold version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a bold version specified.]

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:bold r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

| Parent Elements |
|--------------------------|
| embeddedFont (§19.2.1.9) |

| Attributes | Description |
|---|--|
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.2 **boldItalic (Bold Italic Embedded Font)**

This element specifies a bold italic embedded font that is linked to a parent typeface. Once specified, this bold italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example:* Consider the following embedded font with a bold italic version specified.

```
<p:embeddedFont>  
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>  
  <p:boldItalic r:id="rId2"/>  
</p:embeddedFont>
```

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

| Parent Elements |
|--------------------------|
| embeddedFont (§19.2.1.9) |

| Attributes | Description |
|---|--|
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. end note]

19.2.1.3 browse (Browse Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a single window or browse mode, instead of full screen.

[Example: Consider the following presentation that is set to be viewed in a browse mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    ...
    <p:browse showScrollbar="0"/>
    ...
  </p:showPr>
</p:presentationPr>
```

end example]

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

| Attributes | Description |
|---|---|
| showScrollbar (Show Scroll Bar in Window) | Specifies whether to show the scroll bar in the viewing window. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_ShowInfoBrowse](#)) is located in §A.3. end note]

19.2.1.4 [clrMru \(Color MRU\)](#)

This specifies the most recently used user-selected colors within the presentation. This list contains custom user-selected colors outside the presentation's theme colors, enabling the application to expose these additional color choices for easy reuse. The first item in the list is the most recently used color.

[*Example:* Consider the following presentation with two user-selected colors in the color MRU list.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
...
<p:clrMru>
  <a:srgbClr val="5361EB"/>
  <a:srgbClr val="CCECFF"/>
</p:clrMru>
...
</p:presentationPr>
```

end example]

| Parent Elements |
|-----------------------------|
| presentationPr (§19.2.1.27) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorMRU](#)) is located in §A.4.1. *end note]*

19.2.1.5 [custShow \(Custom Show\)](#)

This element specifies a custom show which is an ordered list of a group of slides that are contained within the presentation. The custom show element allows for the specification of a presentation order that is different from the order in which the slides themselves are stored.

[*Example:* Consider the following custom show list that outlines a couple custom shows for a given set of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
```

```

    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
  <p:custShow name="Custom Show 2" id="1">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>

```

In the above example there are two custom shows specified. The first specifies to present the slides in the order of 4, 3, 2 then 5 while the second specifies to play only slide 4 then 5. *end example*]

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

| Attributes | Description |
|-----------------------------|---|
| id (Custom Show Identifier) | <p>This attribute specifies the custom show identification number. This is a number given that should be unique within the presentation document.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomShowId](#)) is located in §A.3. *end note*]

19.2.1.6 custShow (Custom Show)

This element specifies a custom show that defines a specific slide sequence that the slides are displayed in. This allows for many variants of the same set of slides to be presented.

[*Example:* Consider the following custom show using three slides.

```

<p:custShow name="Custom Show 1" id="0">
  <p:sldLst>
    <p:sld r:id="rId5"/>
    <p:sld r:id="rId2"/>
  </p:sldLst>
</p:custShow>

```

```

    <p:sld r:id="rId4"/>
  </p:sldLst>
</p:custShow>

```

Notice here that the custom show specifies a show, or presentation, where slide 5 is shown first, then slide 2 and finally slide 4. *end example*]

| Parent Elements |
|-------------------------|
| custShowLst (§19.2.1.7) |

| Child Elements | Subclause |
|--------------------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |
| sldLst (List of Presentation Slides) | §19.2.1.35 |

| Attributes | Description |
|-------------------------|---|
| id (Custom Show ID) | Specifies the identification number for this custom show. This should be unique among all the custom shows within the corresponding presentation. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| name (Custom Show Name) | Specifies a name for the custom show. The possible values for this attribute are defined by the ST_Name simple type (§19.7.5). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomShow](#)) is located in §A.3. *end note*]

19.2.1.7 custShowLst (List of Custom Shows)

This element specifies a list of all custom shows that are available within the corresponding presentation. A custom show is a defined slide sequence that allows for the displaying of the slides with the presentation in any arbitrary order.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|------------------------|-----------|
| custShow (Custom Show) | §19.2.1.6 |

[*Note: The W3C XML Schema definition of this element's content model ([CT_CustomShowList](#)) is located in §A.3. end note]*

19.2.1.8 defaultTextStyle (Presentation Default Text Style)

This element specifies the default text styles that are to be used within the presentation. The text style defined here can be referenced when inserting a new slide if that slide is not associated with a master slide or if no styling information has been otherwise specified for the text within the presentation slide.

| Parent Elements |

| lvl9pPr (List Level 9 Text Style) | §21.1.2.4.21 |

[*Note: The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. end note]*

19.2.1.9 embeddedFont (Embedded Font)

This element specifies an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example: Consider the following embedded font.*

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
```

</p:embeddedFont>

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note]*

| Parent Elements |
|------------------------------|
| embeddedFontLst (§19.2.1.10) |

| Child Elements | Subclause |
|--|------------|
| bold (Bold Embedded Font) | §19.2.1.1 |
| boldItalic (Bold Italic Embedded Font) | §19.2.1.2 |
| font (Embedded Font Name) | §19.2.1.13 |
| italic (Italic Embedded Font) | §19.2.1.16 |
| regular (Regular Embedded Font) | §19.2.1.29 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontListEntry](#)) is located in §A.3. *end note]*

19.2.1.10 [embeddedFontLst \(Embedded Font List\)](#)

This element specifies a list of fonts that are embedded within the corresponding presentation. The font data for these fonts is stored alongside the other document parts within the document container. The actual font data is referenced within the embeddedFont element.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|------------------------------|-----------|
| embeddedFont (Embedded Font) | §19.2.1.9 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontList](#)) is located in §A.3. *end note]*

19.2.1.11 [ext \(Extension\)](#)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements for later versions of generating applications.

[*Note: This element is not intended to reintroduce transitional schema into the strict conformance class. end note*]

| Parent Elements |
|--|
| extLst (§19.2.1.12); extLst (§19.3.1.20) |

| Child Elements | Subclause |
|--|-----------|
| Zero or more elements in any namespace | n/a |

| Attributes | Description |
|-----------------------------------|---|
| uri (Uniform Resource Identifier) | <p>This attribute specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag.</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p> |

[*Note: The W3C XML Schema definition of this element's content model ([CT_Extension](#)) is located in §A.3. end note*]

19.2.1.12 extLst (Extension List)

This element specifies the extension list within which all future extensions of element type ext are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

| Parent Elements |

| ext (Extension) | §19.2.1.11 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ExtensionList](#)) is located in §A.3.
end note]

19.2.1.13 font (Embedded Font Name)

This element specifies specific properties describing an embedded font. Once specified, this font is available for use within the presentation. Within a font specification there can be regular, bold, italic and boldItalic versions of the font specified. The actual font data for each of these is referenced using a relationships file that contains links to all available fonts. This font data contains font information for each of the characters to be made available in each version of the font.

[*Example*: Consider the following embedded font.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
</p:embeddedFont>
```

end example]

Font Substitution Logic:

If the specified font is not available on a system being used for rendering, then the attributes of this element are to be utilized in selecting an alternate font.

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

| | 0xDE | Specifies a Thai character set. (IANA name <code>windows-874</code>) | | | | |
| | 0xEE | Specifies an Eastern European character set. (IANA name <code>windows-1250</code>) | | | | |
| | 0xFF | Specifies an OEM character set not defined by ECMA-376. | | | | |
| | Any other value | Application-defined, can be ignored. | | | | |
| | The possible values for this attribute are defined by the W3C XML Schema byte datatype. | | | | | |
| panose (Panose Setting) Namespace: <code>http://purl.oclc.org/ooxml/drawingml/main</code> | Specifies the Panose-1 classification number for the current font using the mechanism defined in §5.2.7.17 of ISO/IEC 14496-22. The possible values for this attribute are defined by the ST_Panose simple type (§22.9.2.8). | | | | | |
| pitchFamily (Similar Font Family) Namespace: <code>http://purl.oclc.org/ooxml/drawingml/main</code> | Specifies the font pitch as well as the font family for the corresponding font. Because the value of this attribute is determined by an octet value this value shall be interpreted as follows: <table><tr><th>Value</th><th>Description</th></tr><tr><td>0x00</td><td>DEFAULT PITCH + UNKNOWN FONT FAMILY</td></tr></table> | | Value | Description | 0x00 | DEFAULT PITCH + UNKNOWN FONT FAMILY |
| Value | Description | | | | | |
| 0x00 | DEFAULT PITCH + UNKNOWN FONT FAMILY | | | | | |

| Attributes | Description | |
|---|---|--|
| ml/main | 0x01 | FIXED PITCH + UNKNOWN FONT FAMILY |
| | 0x02 | VARIABLE PITCH + UNKNOWN FONT FAMILY |
| | 0x10 | DEFAULT PITCH + ROMAN FONT FAMILY |
| | 0x11 | FIXED PITCH + ROMAN FONT FAMILY |
| | 0x12 | VARIABLE PITCH + ROMAN FONT FAMILY |
| | 0x20 | DEFAULT PITCH + SWISS FONT FAMILY |
| | 0x21 | FIXED PITCH + SWISS FONT FAMILY |
| | 0x22 | VARIABLE PITCH + SWISS FONT FAMILY |
| | 0x30 | DEFAULT PITCH + MODERN FONT FAMILY |
| | 0x31 | FIXED PITCH + MODERN FONT FAMILY |
| | 0x32 | VARIABLE PITCH + MODERN FONT FAMILY |
| | 0x40 | DEFAULT PITCH + SCRIPT FONT FAMILY |
| | 0x41 | FIXED PITCH + SCRIPT FONT FAMILY |
| | 0x42 | VARIABLE PITCH + SCRIPT FONT FAMILY |
| | 0x50 | DEFAULT PITCH + DECORATIVE FONT FAMILY |
| | 0x51 | FIXED PITCH + DECORATIVE FONT FAMILY |
| | 0x52 | VARIABLE PITCH + DECORATIVE FONT FAMILY |
| | <p>This information is determined by querying the font when present and shall not be modified when the font is not available. This information can be used in font substitution logic to locate an appropriate substitute font when this font is not available. [Note: Although the attribute name is pitchFamily, the integer value of this attribute specifies the font family with higher 4 bits and the font pitch with lower 4 bits. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema byte datatype.</p> | |
| | typeface (Text Typeface) | Specifies the typeface, or name of the font that is to be used. The typeface is a string name of the specific font that should be used in rendering the presentation. If this font is not available within the font list of the generating application than font substitution logic should be utilized in order to select an alternate font. |
| Namespace: http://purl.oclc.org/ooxml/drawing ml/main | The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80). | |

[Note: The W3C XML Schema definition of this element's content model ([CT_TextFont](#)) is located in §A.4.1. *end note*]

19.2.1.14 `handoutMasterId` (Handout Master ID)

This element specifies a handout master that is available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

[*Example:* Consider the following specification of a handout master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
  <p:handoutMasterIdLst>
    <p:handoutMasterId r:id="rId8"/>
  </p:handoutMasterIdLst>
...
</p:presentation>
```

end example]

| Parent Elements |
|---------------------------------|
| handoutMasterIdLst (§19.2.1.15) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|---|---|
| id (Relationship Identifier) | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the handoutMaster element defining this handout master. |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[*Note:* The W3C XML Schema definition of this element's content model (`CT_HandoutMasterIdListEntry`) is located in §A.3. *end note]*

19.2.1.15 `handoutMasterIdLst` (List of Handout Master IDs)

This element specifies a list of identification information for the handout master slides that are available within the corresponding presentation. A handout master is a slide that is specifically designed for printing as a handout.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|-------------------------------------|------------|
| handoutMasterId (Handout Master ID) | §19.2.1.14 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_HandoutMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.16 italic (Italic Embedded Font)

This element specifies an italic embedded font that is linked to a parent typeface. Once specified, this italic version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[*Example*: Consider the following embedded font with a italic version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:italic r:id="rId2"/>
</p:embeddedFont>
```

end example]

[*Note*: Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note*]

| Parent Elements |
|--------------------------|
| embeddedFont (§19.2.1.9) |

| Attributes | Description |
|---|--|
| id (Relationship Identifier) | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note*]

19.2.1.17 kinsoku (Kinsoku Settings)

This element specifies the presentation-wide kinsoku settings that define the line breaking behaviour of East Asian text within the corresponding presentation.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Attributes | Description |
|--|--|
| invalEndChars (Invalid Kinsoku End Characters) | Specifies the characters that cannot end a line of text. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| invalStChars (Invalid Kinsoku Start Characters) | Specifies the characters that cannot start a line of text. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| lang (Language) | Specifies the corresponding East Asian language that these settings apply to. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Kinsoku](#)) is located in §A.3. *end note*]

19.2.1.18 kiosk (Kiosk Slide Show Mode)

This element specifies that the presentation slide show should be viewed in a full-screen kiosk mode. A presentation viewed in kiosk mode should have user input disabled and restarts after a specified interval.

[*Example:* Consider the following presentation that is set to be viewed in a looping kiosk mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr loop="1" showNarration="1">
    ...
    <p:kiosk/>
    ...
  </p:showPr>
</p:presentationPr>
```

end example]

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

| Attributes | Description |
|------------------------|--|
| restart (Restart Show) | <p>Specifies the time length that the presentation should run until it is to be restarted. That is, the presentation should loop back to the first slide specified in the presentation or custom show. This value is specified in 1/1000ths of a second and measured from the most recent time the presentation started or restarted.</p> <p>[<i>Note:</i> The counter is reset when a presentation is restarted due to automatic looping at the end of a show, if specified by the loop attribute of showPr. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ShowInfoKiosk](#)) is located in §A.3. *end note*]

19.2.1.19 modifyVerifier (Modification Verifier)

This element specifies the write protection settings which have been applied to a PresentationML document. *Write protection* refers to a mode in which the document's contents should not be modified, and the document should not be resaved using the same file name.

When present, the application shall require a password to enable modifications to the document. If the supplied password does not match the hash value in this attribute, then write protection shall be enabled. If this element is omitted, then no write protection shall be applied to the current document. Since this protection does not encrypt the document, malicious applications might circumvent its use.

The password supplied to the algorithm is to be a UTF-16LE encoded string; strings longer than 510 octets are truncated to 510 octets. If there is a leading BOM character (U+FEFF) in the encoded password it is removed before hash calculation. The attributes of this element specify the algorithm to be used to verify the password provided by the user.

[*Example:* Consider a PresentationML document that can only be opened in a write protected state unless a password is provided, in which case the file would be opened in an editable state. This requirement would be specified using the following PresentationML:

```
<p:modifyVerifier p:algorithmName="SHA-512" ...  
p:hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" ... />
```

...In order for the hosting application to enable edits to the document, the hosting application would have to be provided with a password that the hosting application would then hash using the algorithm specified by the

algorithm attributes and compare to the value of the hashValue attribute (9oN7nWkCAYEZib1RomSJTjmPpCY=). If the two values matched, the file would be opened in an editable state. *end example*]

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Attributes | Description | | | | | | | | | | | | | | | | |
|--|---|-------|-----------|-----|--|-----|--|-----|--|------------|--|------------|---|-------|--|---------|--|

| Attributes | Description | | | | | | |
|--|---|---------|---|---------|---|-----------|---|
| | <table border="1" data-bbox="418 247 1477 499"> <tr> <td data-bbox="418 247 667 331">SHA-384</td><td data-bbox="667 247 1477 331">Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> <tr> <td data-bbox="418 331 667 415">SHA-512</td><td data-bbox="667 331 1477 415">Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> <tr> <td data-bbox="418 415 667 499">WHIRLPOOL</td><td data-bbox="667 415 1477 499">Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used.</td></tr> </table> <p data-bbox="418 537 1477 604">[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 642 1175 709">< ... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p data-bbox="418 747 1477 852">The algorithmName attribute value of “SHA-1” specifies that the SHA-1 hashing algorithm must be used to generate a hash from the user-defined password. <i>end example</i>]</p> <p data-bbox="418 890 1477 957">The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> | SHA-384 | Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. | SHA-512 | Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. | WHIRLPOOL | Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. |
| SHA-384 | Specifies that the SHA-384 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. | | | | | | |
| SHA-512 | Specifies that the SHA-512 algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. | | | | | | |
| WHIRLPOOL | Specifies that the WHIRLPOOL algorithm, as defined by ISO/IEC 10118-3:2004 shall be used. | | | | | | |
| hashValue (Password Hash Value) | <p data-bbox="418 974 1477 1117">Specifies the hash value for the password required to edit this chartsheet. This value shall be compared with the resulting hash value after hashing the user-supplied password using the algorithm specified by the preceding attributes and parent XML element, and if the two values match, the protection shall no longer be enforced.</p> <p data-bbox="418 1155 1477 1222">If this value is omitted, then the reservationPassword attribute shall contain the password hash for the workbook.</p> <p data-bbox="418 1260 1477 1327">[<i>Example:</i> Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre data-bbox="456 1365 1175 1432"><... algorithmName="SHA-1" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p data-bbox="418 1470 1477 1650">The hashValue attribute value of 9oN7nWkCAyEZib1RomSJTjmPpCY= specifies that the user-supplied password must be hashed using the pre-processing defined by the parent element (if any) followed by the SHA-1 algorithm (specified via the algorithmName attribute value of SHA-1) and that the resulting has value must be 9oN7nWkCAyEZib1RomSJTjmPpCY= for the protection to be disabled. <i>end example</i>]</p> <p data-bbox="418 1688 1477 1755">The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p> | | | | | | |
| saltValue (Salt Value for Password Verifier) | <p data-bbox="418 1772 1477 1871">Specifies the salt which was prepended to the user-supplied password before it was hashed using the hashing algorithm defined by the preceding attribute values to generate the hashValue attribute, and which shall also be prepended to the user-supplied</p> | | | | | | |

| Attributes | Description |
|--|---|
| | <p>password before attempting to generate a hash value for comparison. A <i>salt</i> is a random string which is added to a user-supplied password before it is hashed in order to prevent a malicious party from pre-calculating all possible password/hash combinations and simply using those pre-calculated values (often referred to as a "dictionary attack").</p> <p>If this attribute is omitted, then no salt shall be prepended to the user-supplied password before it is hashed for comparison with the stored hash value.</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... saltValue="ZUdHa+D8F/OAKP3I7ssUnQ==" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The saltValue attribute value of ZUdHa+D8F/OAKP3I7ssUnQ== specifies that the user-supplied password must have this value prepended before it is run through the specified hashing algorithm to generate a resulting hash value for comparison. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema base64Binary datatype.</p> |
| spinValue (Iterations to Run Hashing Algorithm) | <p>Specifies the number of times the hashing function shall be iteratively run (runs using each iteration's result plus a 4 byte value (0-based, little endian) containing the number of the iteration as the input for the next iteration) when attempting to compare a user-supplied password with the value stored in the hashValue attribute.</p> <p>[<i>Rationale</i>: Running the algorithm many times increases the cost of exhaustive search attacks correspondingly. Storing this value allows for the number of iterations to be increased over time to accommodate faster hardware (and hence the ability to run more iterations in less time). <i>end rationale</i>]</p> <p>[<i>Example</i>: Consider an Office Open XML document with the following information stored in one of its protection elements:</p> <pre><... spinCount="100000" hashValue="9oN7nWkCAyEZib1RomSJTjmPpCY=" /></pre> <p>The spinCount attribute value of 100000 specifies that the hashing function must be run one hundred thousand times to generate a hash value for comparison with the hashValue attribute. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ModifyVerifier](#)) is located in §A.3. *end note*]

19.2.1.20 notesMasterId (Notes Master ID)

This element specifies a notes master that is available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

[Example: Consider the following specification of a notes master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
<p:notesMasterIdLst>
  <p:notesMasterId r:id="rId8"/>
</p:notesMasterIdLst>
...
</p:presentation>
```

end example]

| Parent Elements |
|-------------------------------|
| notesMasterIdLst (§19.2.1.21) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|---|---|
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the notesMaster element defining this notes master. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_NotesMasterIdListEntry](#)) is located in §A.3. end note]

19.2.1.21 notesMasterIdLst (List of Notes Master IDs)

This element specifies a list of identification information for the notes master slides that are available within the corresponding presentation. A notes master is a slide that is specifically designed for the printing of the slide along with any attached notes.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|---------------------------------|------------|
| notesMasterId (Notes Master ID) | §19.2.1.20 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NotesMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.22 notesSz (Notes Slide Size)

This element specifies the size of slide surface used for notes slides and handout slides. Objects within a notes slide can be specified outside these extents, but the notes slide has a background surface of the specified size when presented or printed. This element is intended to specify the region to which content is fitted in any special format of printout the application might choose to generate, such as an outline handout.

[*Example:* Consider the following specifying of the size of a notes slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
  <p:notesSz cx="9144000" cy="6858000"/>
...
</p:presentation>
```

end example]

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Attributes | Description |
|---|--|
| cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

| Attributes | Description |
|--|--|
| cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000" /></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

19.2.1.23 penClr (Pen Color for Slide Show)

This element specifies the pen color that should be used to make markings on the slides while in a presentation.

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.2.1.24 photoAlbum (Photo Album Information)

This element specifies that the corresponding presentation contains a photo album. A photo album specifies a list of images within the presentation that spread across one or more slides, all of which share a consistent layout. Each image in the album is formatted with a consistent style. This functionality enables the application to manage all of the images together and modify their ordering, layout, and formatting as a set.

This element does not enforce the specified properties on individual photo album images; rather, it specifies common settings that should be applied by default to all photo album images and their containing slides. Images that are part of the photo album are identified by the presence of the `isPhoto` element in the definition of the picture.

[*Example:* Consider the following presentation that has been specified as a photo album

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
  <p:photoAlbum bw="1" layout="2pic"/>
...
</p:presentation>
```

end example]

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|-----------------------------------|--|
| bw (Black and White) | Specifies whether all pictures in the photo album are to be displayed as black and white. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| frame (Frame Type) | Specifies the frame type that is to be used on all the pictures in the photo album. The possible values for this attribute are defined by the ST_PhotoAlbumFrameShape simple type (§19.7.7). |
| layout (Photo Album Layout) | Specifies the layout that is to be used to arrange the pictures in the photo album on individual slides. The possible values for this attribute are defined by the ST_PhotoAlbumLayout simple type (§19.7.8). |
| showCaptions (Show/Hide Captions) | Specifies whether to show captions for pictures in the photo album. Captions are text boxes grouped with each image, with the group set to not allow ungrouping. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_PhotoAlbum](#)) is located in §A.3. *end note*]

19.2.1.25 **present (Presenter Slide Show Mode)**

This element specifies that the presentation slide show should be viewed in a full-screen presenter mode. In this mode, the presentation is displayed on one monitor while a different monitor displays notes and provides navigation controls intended to be viewed only by the presenter.

[*Example:* Consider the following presentation that is set to be viewed in a present mode.

```
<p:presentationPr xmlns:a="" xmlns:r="" xmlns:p="">
  <p:showPr>
    ...
    <p:present/>
    ...
  </p:showPr>
</p:presentationPr>
```

end example]

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.2.1.26 **presentation (Presentation)**

This element specifies within it fundamental presentation-wide properties.

[*Example:* Consider the following presentation with a single slide master and two slides. In addition to these commonly used elements there can also be the specification of other properties such as slide size, notes size and default text styles.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="">
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
  <p:sldIdLst>
    <p:sldId id="256" r:id="rId3"/>
    <p:sldId id="257" r:id="rId4"/>
  </p:sldIdLst>
  <p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
  <p:notesSz cx="6858000" cy="9144000"/>
  <p:defaultTextStyle>
    ...
  </p:defaultTextStyle>
```

```
</p:defaultTextStyle>
</p:presentation>
```

end example]

| Parent Elements |
|--|
| Root element of PresentationML Presentation part |

| Child Elements | Subclause |
|--|------------|
| custDataLst (Customer Data List) | §19.3.1.18 |
| custShowLst (List of Custom Shows) | §19.2.1.7 |
| defaultTextStyle (Presentation Default Text Style) | §19.2.1.8 |
| embeddedFontLst (Embedded Font List) | §19.2.1.10 |
| extLst (Extension List) | §19.2.1.12 |

| photoAlbum (Photo Album Information) | §19.2.1.24 |
| sldIdLst (List of Slide IDs) | §19.2.1.34 |
| sldMasterIdLst (List of Slide Master IDs) | §19.2.1.37 |
| sldSz (Presentation Slide Size) | §19.2.1.39 |
| smartTags (Smart Tags) | §19.2.1.40 |

| Attributes | Description |
|--|---|
| autoCompressPictures (Automatically Compress Pictures) | Specifies whether the generating application should automatically compress all pictures for this presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| bookmarkIdSeed (Bookmark ID Seed) | Specifies a seed for generating bookmark IDs to ensure IDs remain unique across the document. This value specifies the number to be used as the ID for the next new bookmark created. The possible values for this attribute are defined by the ST_BookmarkIdSeed simple type (§19.7.1). |
| compatMode | Specifies whether the generating application is to be in a compatibility mode which |

| Attributes | Description |
|--|--|
| (Compatibility Mode) | <p>serves to inform the user of any loss of content or functionality when working with older formats.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| conformance (Document Conformance Class) | <p>Specifies the conformance class (§2.4) to which the PresentationML document conforms.</p> <p>If this attribute is omitted, its default value is <code>transitional</code>.</p> <p>[<i>Example:</i> Consider the following PresentationML Presentation part markup:</p> <pre><p:presentation conformance="strict"> ... </p:presentation></pre> <p>This document has a conformance attribute value of <code>strict</code>, therefore it conforms to the PML Strict conformance class. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ConformanceClass simple type (§22.9.2.2).</p> |
| embedTrueTypeFonts (Embed True Type Fonts) | <p>Specifies whether the generating application should automatically embed true type fonts or not.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| firstSlideNum (First Slide Number) | <p>Specifies the first slide number in the presentation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p> |
| removePersonalInfoOnSave (Remove Personal Information on Save) | <p>Specifies whether to automatically remove personal information when the presentation document is saved.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rtl (Right-To-Left Views) | <p>Specifies if the current view of the user interface is oriented right-to-left or left-to-right. The view is right-to-left if this value is set to <code>true</code>, and left-to-right otherwise.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| saveSubsetFonts (Save Subset Fonts) | <p>Specifies to save only the subset of characters used in the presentation when a font is embedded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| serverZoom (Server | Specifies the scaling to be used when the presentation is embedded in another |

| Attributes | Description |
|--|--|
| Zoom) | document. The embedded slides are to be scaled by this percentage. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| showSpecialPlsOnTitleSld (Show Header and Footer Placeholders on Titles) | Specifies whether to show the header and footer placeholders on the title slides. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| strictFirstAndLastChars (Strict First and Last Characters) | Specifies whether to use strict characters for starting and ending lines of Japanese text. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Presentation](#)) is located in §A.3. *end note*]

19.2.1.27 presentationPr (Presentation-wide Properties)

This element functions as a parent element within which additional presentation-wide document properties are contained. All properties and their corresponding settings are defined within the child elements.

| Parent Elements |
|---|
| Root element of PresentationML Presentation Properties part |

| Child Elements | Subclause |
|--|------------|
| clrMru (Color MRU) | §19.2.1.4 |
| extLst (Extension List) | §19.2.1.12 |
| prnPr (Printing Properties) | §19.2.1.28 |
| showPr (Presentation-wide Show Properties) | §19.2.1.30 |

[Note: The W3C XML Schema definition of this element's content model ([CT_PresentationProperties](#)) is located in §A.3. *end note*]

19.2.1.28 prnPr (Printing Properties)

This element specifies the default printing properties associated with this presentation document.

| Parent Elements |
|-----------------------------|
| presentationPr (§19.2.1.27) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|--|--|
| clrMode (Print Color Mode) | Specifies the color mode to be used when printing. The possible values for this attribute are defined by the ST_PrintColorMode simple type (§19.7.11). |
| frameSlides (Frame slides when printing) | Specifies whether slides should be framed when printing. When framed, an outline border is printed for each slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| hiddenSlides (Print Hidden Slides) | Specifies whether hidden slides should be printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| prnWhat (Print Output) | Specifies what the default print output is in terms of content layout. The possible values for this attribute are defined by the ST_PrintWhat simple type (§19.7.12). |
| scaleToFitPaper (Scale to Fit Paper when printing) | Specifies whether the print output should be scaled to fit the paper being used. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_PrintProperties](#)) is located in §A.3.
end note]

19.2.1.29 regular (Regular Embedded Font)

This element specifies a regular embedded font that is linked to a parent typeface. Once specified, this regular version of the given typeface name is available for use within the presentation. The actual font data is referenced using a relationships file that contains links to all fonts available. This font data contains font information for each of the characters to be made available.

[Example: Consider the following embedded font with a regular version specified.

```
<p:embeddedFont>
  <p:font typeface="MyFont" pitchFamily="34" charset="0"/>
  <p:regular r:id="rId2"/>
```

</p:embeddedFont>

end example]

[*Note:* Not all characters for a typeface must be stored. It is up to the generating application to determine which characters are to be stored in the corresponding font data files. *end note]*

| Parent Elements |
|--------------------------|
| embeddedFont (§19.2.1.9) |

| Attributes | Description |
|---|--|
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this embedded font that is referenced in a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedFontDataId](#)) is located in §A.3. *end note]*

19.2.1.30 showPr (Presentation-wide Show Properties)

This element functions as a parent element within which all presentation-wide show properties are contained. All properties and their corresponding settings are defined within the child elements.

| Parent Elements |
|-----------------------------|
| presentationPr (§19.2.1.27) |

| Child Elements | Subclause |
|-------------------------------------|------------|
| browse (Browse Slide Show Mode) | §19.2.1.3 |
| custShow (Custom Show) | §19.2.1.5 |
| extLst (Extension List) | §19.2.1.12 |
| kiosk (Kiosk Slide Show Mode) | §19.2.1.18 |
| penClr (Pen Color for Slide Show) | §19.2.1.23 |
| present (Presenter Slide Show Mode) | §19.2.1.25 |
| sldAll (All Slides) | §19.2.1.32 |
| sldRg (Slide Range) | §19.2.1.38 |

| Attributes | Description |
|--|--|
| loop (Loop Slide Show) | Specifies whether the slide show should be set to loop at the end. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showAnimation (Show Animation in Slide Show) | Specifies whether slide show animation should be shown when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showNarration (Show Narration in Slide Show) | Specifies whether slide show narration should be played when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| useTimings (Use Timings in Slide Show) | Specifies whether slide transition timings should be used to advance slides when presenting. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_ShowProperties](#)) is located in §A.3. *end note*]

19.2.1.31 sld (Presentation Slide)

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[Example: Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
  </p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

| Parent Elements |
|---------------------|
| sldLst (§19.2.1.35) |

| Attributes | Description |
|---|--|
| id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | This attribute specifies the relationship id that is used to reference to the actual slide XML file that contains all the information to the slide listed within the slide list. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideRelationshipListEntry](#)) is located in §A.3. *end note*]

19.2.1.32 sldAll (All Slides)

This attribute specifies all slides instead of a given range of slides for use within the html publishing properties as well as the show properties.

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

[Note: The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.2.1.33 sldId (Slide ID)

This element specifies a presentation slide that is available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

[Example: Consider the following specification of a slide master within a presentation]

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
  ..
  <p:sldIdLst>
    <p:sldId id="256" r:id="rId3"/>
    <p:sldId id="257" r:id="rId4"/>
    <p:sldId id="258" r:id="rId5"/>
    <p:sldId id="259" r:id="rId6"/>
    <p:sldId id="260" r:id="rId7"/>
  </p:sldIdLst>
  ..
</p:presentation>
```

end example]

| Parent Elements |
|-----------------------|
| sldIdLst (§19.2.1.34) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|---|--|
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sld element defining this slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| id (Slide Identifier) | Specifies the slide identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideId simple type (§19.7.13). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.34 sldIdLst (List of Slide IDs)

This element specifies a list of identification information for the slides that are available within the corresponding presentation. A slide contains the information that is specific to a single slide such as slide-specific shape and text information.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|------------------|------------|
| sldId (Slide ID) | §19.2.1.33 |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideIdList](#)) is located in §A.3. *end note*]

19.2.1.35 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

| Parent Elements |
|----------------------|
| custShow (§19.2.1.6) |

| Child Elements | Subclause |
|--------------------------|------------|
| sld (Presentation Slide) | §19.2.1.31 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideRelationshipList](#)) is located in §A.3. *end note*]

19.2.1.36 sldMasterId (Slide Master ID)

This element specifies a slide master that is available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

[*Example:* Consider the following specification of a slide master within a presentation

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
  <p:sldMasterIdLst>
    <p:sldMasterId id="2147483648" r:id="rId1"/>
  </p:sldMasterIdLst>
...
</p:presentation>
```

end example]

| Parent Elements |
|-----------------------------|
| sldMasterIdLst (§19.2.1.37) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|------------------------------|---|
| id (Relationship Identifier) | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location within a presentation of the sldMaster element defining this slide master. |

| Attributes | Description |
|---|--|
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| id (Slide Master Identifier) | Specifies the slide master identifier that is to contain a value that is unique throughout the presentation. The possible values for this attribute are defined by the ST_SlideMasterId simple type (§19.7.16). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideMasterIdListEntry](#)) is located in §A.3. *end note*]

19.2.1.37 sldMasterIdLst (List of Slide Master IDs)

This element specifies a list of identification information for the slide master slides that are available within the corresponding presentation. A slide master is a slide that is specifically designed to be a template for all related child layout slides.

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Child Elements | Subclause |
|-------------------------------|------------|
| sldMasterId (Slide Master ID) | §19.2.1.36 |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideMasterIdList](#)) is located in §A.3. *end note*]

19.2.1.38 sldRg (Slide Range)

This element specifies a slide range for use within the html publishing properties as well as the show properties.

[Note: The indexes used here correlate directly with the presentation slide numbers which they reference to. That is the slide range must be greater than or equal to 1 and also less than or equal to the number of slides in the presentation document. *end note*]

| Parent Elements |
|---------------------|
| showPr (§19.2.1.30) |

| Attributes | Description |
|------------|---|
| end (End) | This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |
| st (Start) | This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |

[Note: The W3C XML Schema definition of this element's content model ([CT_IndexRange](#)) is located in §A.3. *end note*]

19.2.1.39 sldSz (Presentation Slide Size)

This element specifies the size of the presentation slide surface. Objects within a presentation slide can be specified outside these extents, but this is the size of background surface that is shown when the slide is presented or printed..

[Example: Consider the following specifying of the size of a presentation slide.

```
<p:presentation xmlns:a="" xmlns:r="" xmlns:p="" embedTrueTypeFonts="1">
...
<p:sldSz cx="9144000" cy="6858000" type="screen4x3"/>
...
</p:presentation>
```

end example]

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Attributes | Description |
|--------------------|---|
| cx (Extent Length) | Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object). [Example: Consider a DrawingML object specified as follows: <pre><... cx="1828800" cy="200000"/></pre> The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>] The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17). |

| Attributes | Description |
|---------------------|---|
| cy (Extent Width) | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_SlideSizeCoordinate simple type (§19.7.17).</p> |
| type (Type of Size) | <p>Specifies the kind of slide size that should be used. This identifies in particular the expected delivery platform for this presentation.</p> <p>The possible values for this attribute are defined by the ST_SlideSizeType simple type (§19.7.18).</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SlideSize](#)) is located in §A.3. *end note*]

19.2.1.40 smartTags (Smart Tags)

This element specifies that references to smart tags exist within this document. [*Note:* For a complete definition of smart tags, which are semantically identical throughout Office Open XML, see §17.5.1. *end note*] To denote the location of smart tags on individual runs of text, there smart tag identifier attributes are specified for each run to which a smart tag applies. These are further specified in the run property attributes within DrawingML.

[*Example:* Consider the following PresentationML markup:

```
<p:presentation>
...
<p:smartTags r:id="rId1"/>
</p:presentation>
```

The presence of the smartTags element specifies that there is smart tag information within the PresentationML package. Individual runs are then inspected for the value of the smtId attribute to determine where smart tags might apply, for example:

```
<p:txBody>
  <a:bodyPr/>
  <a:lstStyle/>
```

```

<a:p>
  <a:r>
    <a:rPr lang="en-US" dirty="0" smtId="1"/>
    <a:t>CNTS</a:t>
  </a:r>
  <a:endParaRPr lang="en-US" dirty="0"/>
</a:p>
</p:txBody>

```

In the sample above there is a smart tag identifier of 1 specified for this run of text to denote that the text should be inspected for smart tag information. *end example*]

| Parent Elements |
|---------------------------|
| presentation (§19.2.1.26) |

| Attributes | Description |
|---|---|
| id (Relationship Identifier) | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this smart tag. |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SmartTags](#)) is located in §A.3. *end note*]

19.2.2 View Properties

This section contains all properties that pertain to the viewing of the presentation.

19.2.2.1 cSldViewPr (Common Slide View Properties)

This element functions as a container for slide view properties that are common across multiple view property elements. The specific properties and associated values for these view properties reside within the child elements and attributes.

| Parent Elements |
|---|
| notesViewPr (§19.2.2.8); slideViewPr (§19.2.2.16) |

| Child Elements | Subclause |
|----------------------------------|-----------|
| cViewPr (Common View Properties) | §19.2.2.2 |
| guideLst (List of Guides) | §19.2.2.5 |

| Attributes | Description |
|---|---|
| showGuides (Show Guides in View) | Specifies whether to show guides when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| snapToGrid (Snap Objects to Grid) | Specifies whether objects should snap to underlying presentation grid when editing. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| snapToObjects (Snap Objects to Objects) | Specifies whether objects should snap to other objects when editing the presentation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_CommonSlideViewProperties](#)) is located in §A.3. *end note*]

19.2.2.2 cViewPr (Common View Properties)

This element specifies the view properties that are common across multiple view property elements.

| Parent Elements |
|--|
| cSldViewPr (§19.2.2.1); notesTextViewPr (§19.2.2.7); outlineViewPr (§19.2.2.10); sorterViewPr (§19.2.2.17) |

| Child Elements | Subclause |
|----------------------|------------|
| origin (View Origin) | §19.2.2.9 |
| scale (View Scale) | §19.2.2.13 |

| Attributes | Description |
|---------------------------|---|
| varScale (Variable Scale) | Specifies that the view content should automatically scale to best fit the current window size. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_CommonViewProperties](#)) is located in §A.3. *end note*]

19.2.2.3 [gridSpacing \(Grid Spacing\)](#)

This element specifies the grid spacing that should be used for the grid underlying the presentation document. The grid can be used to align objects on the slide and to display visual positioning cues.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Attributes | Description |
|---|---|
| cx (Extent Length) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| cy (Extent Width) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[Example: Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

19.2.2.4 [guide \(A Guide\)](#)

This element specifies a guide within the presentation. Guides are lines used for arranging layouts and content and never appear except as an aid in editing slides.

| Parent Elements |
|----------------------|
| guideLst (§19.2.2.5) |

| Attributes | Description |
|----------------------------|---|
| orient (Guide Orientation) | Specifies the orientation for a guide. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |
| pos (Guide Position) | Specifies the position information for a guide. The possible values for this attribute are defined by the ST_Coordinate32 simple type (§20.1.10.17). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Guide](#)) is located in §A.3. *end note*]

19.2.2.5 [guideLst \(List of Guides\)](#)

This element specifies a list of guides for a particular view of the presentation.

| Parent Elements |
|------------------------|
| cSldViewPr (§19.2.2.1) |

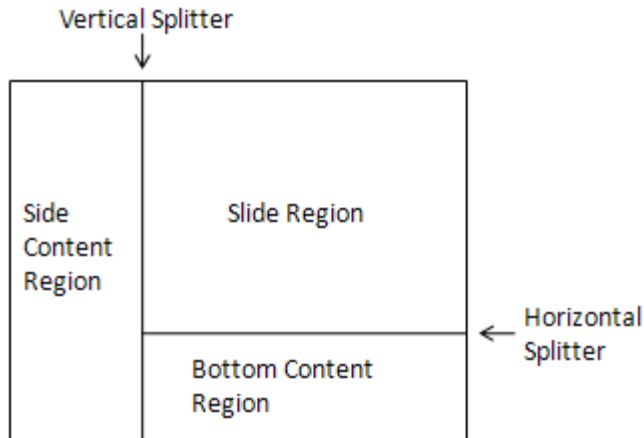

| Child Elements | Subclause |
|-----------------|-----------|
| guide (A Guide) | §19.2.2.4 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_GuideList](#)) is located in §A.3. *end note*]

19.2.2.6 [normalViewPr \(Normal View Properties\)](#)

This element specifies the view properties associated with the normal view mode. The normal view consists of three content regions: the slide itself, a side content region, and a bottom content region. The content of the side content region and bottom content region is determined by the generating application. Properties pertaining to the positioning of the different content regions are stored in this element. This information allows the application to save its view state to the file, so that when reopened the view is in the same state as when the presentation was last saved.

A vertical splitter bar separates the slide from the side content region. A horizontal splitter bar separates the slide from the content region below the slide. If the presentation is set to left-to-right, the side content region is to the left of the slide. If the presentation is set to right-to-left, the side content region is to the right of the slide.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|---|------------|
| extLst (Extension List) | §19.2.1.12 |
| restoredLeft (Normal View Restored Left Properties) | §19.2.2.11 |
| restoredTop (Normal View Restored Top Properties) | §19.2.2.12 |

| Attributes | Description |
|--|--|
| horzBarState (State of the Horizontal Splitter Bar) | Specifies the state that the horizontal splitter bar should be in when in normal view mode. The region to be maximized or minimized is the side content region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19). |
| preferSingleView (Prefer Single View) | Specifies whether the user prefers to see a full-window single-content region over the standard normal view with three content regions. If enabled, the application can choose to display one of the content regions in the entire window. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showOutlineIcons (Show Outline Icons in Normal View) | Specifies whether the application should show icons if displaying outline content in any of the content regions of normal view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| snapVertSplitter (Snap Vertical Splitter) | Specifies whether the vertical splitter should snap to a minimized state when the side region is sufficiently small. The specific parameters of this behaviour are left to the generating application. |

| Attributes | Description |
|---|---|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| vertBarState (State of the Vertical Splitter Bar) | Specifies the state that the vertical splitter bar should be in when in normal view mode. The region to be maximized or minimized is the slide region. The possible values for this attribute are defined by the ST_SplitterBarState simple type (§19.7.19). |

[Note: The W3C XML Schema definition of this element's content model ([CT_NormalViewProperties](#)) is located in §A.3. *end note*]

19.2.2.7 [notesTextViewPr \(Notes Text View Properties\)](#)

This element functions as a parent element within which all properties associated with the notes text view are contained. All properties are defined within the child elements.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|----------------------------------|------------|
| cViewPr (Common View Properties) | §19.2.2.2 |
| extLst (Extension List) | §19.2.1.12 |

[Note: The W3C XML Schema definition of this element's content model ([CT_NotesTextViewProperties](#)) is located in §A.3. *end note*]

19.2.2.8 [notesViewPr \(Notes View Properties\)](#)

This element functions as a parent element within which all view properties associated with notes are contained. All properties are defined within the child elements.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|---|------------|
| cSldViewPr (Common Slide View Properties) | §19.2.2.1 |
| extLst (Extension List) | §19.2.1.12 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NotesViewProperties](#)) is located in §A.3. *end note*]

19.2.2.9 [origin \(View Origin\)](#)

This element specifies the origin of the slide when it is being viewed with various scaling factors using the scale element.

| Parent Elements |
|---------------------|
| cViewPr (§19.2.2.2) |

| Attributes | Description |
|---|---|
| x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |
| y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

19.2.2.10 [outlineViewPr \(Outline View Properties\)](#)

This element functions as a parent element within which all view properties associated with the outline view mode are contained. All properties are defined within the child elements.

Outline view displays only the textual content of a presentation. The presentation is formatted as an outline, with slide titles as the first level of the outline. Body text on slides is indented below the slide title.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|--------------------------------------|------------|
| cViewPr (Common View Properties) | §19.2.2.2 |
| extLst (Extension List) | §19.2.1.12 |
| sldLst (List of Presentation Slides) | §19.2.2.15 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OutlineViewProperties](#)) is located in §A.3. *end note*]

19.2.2.11 [restoredLeft \(Normal View Restored Left Properties\)](#)

This element specifies the sizing of the side content region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

| Parent Elements |
|--------------------------|
| normalViewPr (§19.2.2.6) |

| Attributes | Description |
|--------------------------------------|---|
| autoAdjust (Auto Adjust Normal View) | Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sz (Normal View Dimension Size) | Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NormalViewPortion](#)) is located in §A.3. *end note*]

19.2.2.12 [restoredTop \(Normal View Restored Top Properties\)](#)

This element specifies the sizing of the top slide region of the normal view, when the region is of a variable restored size (neither minimized nor maximized).

| Parent Elements |
|--------------------------|
| normalViewPr (§19.2.2.6) |

| Attributes | Description |
|--------------------------------------|---|
| autoAdjust (Auto Adjust Normal View) | Specifies whether the size of the side content region should compensate for the new size when resizing the window containing the view within the application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sz (Normal View Dimension Size) | Specifies the size of the slide region (width when a child of restoredTop, height when a child of restoredLeft). The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[Note: The W3C XML Schema definition of this element's content model ([CT_NormalViewPortion](#)) is located in §A.3. *end note*]

19.2.2.13 scale (View Scale)

This element specifies the view scaling factors that the presentation was last viewed with.

| Parent Elements |
|---------------------|
| cViewPr (§19.2.2.2) |

| Child Elements | Subclause |
|-----------------------|--------------|
| sx (Horizontal Ratio) | §20.1.2.2.38 |
| sy (Vertical Ratio) | §20.1.2.2.39 |

[Note: The W3C XML Schema definition of this element's content model ([CT_Scale2D](#)) is located in §A.4.1. *end note*]

19.2.2.14 sld (Presentation Slide)

This element specifies a presentation slide and properties specific to the slide's appearance in outline view.

[Example: Consider the following presentation slide that has been collapsed in outline view.

```
<p:viewPr xmlns:a="" xmlns:r="" xmlns:p="" lastView="outlineView">
...
<p:outlineViewPr>
```

```
...
<p:sldLst>
  <p:sld r:id="rId1" collapse="1"/>
</p:sldLst>
...
</p:outlineViewPr>
...
</p:viewPr>
```

end example]

| Parent Elements |
|---------------------|
| sldLst (§19.2.2.15) |

| Attributes | Description |
|---|--|
| collapse (Collapsed) | Specifies whether this presentation slide is to be shown as collapsed within outline view. That is, all text other than the slide title is not shown to the user. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| id (Relationship Identifier) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship identifier that is used in conjunction with a corresponding relationship file to resolve the location of this presentation slide within a presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_OutlineViewSlideEntry](#)) is located in §A.3. *end note*]

19.2.2.15 sldLst (List of Presentation Slides)

This element specifies a list of presentation slides. A presentation slide contains the information that is specific to a single slide such as slide-specific shape and text information.

| Parent Elements |
|----------------------------|
| outlineViewPr (§19.2.2.10) |

| Child Elements | Subclause |
|--------------------------|------------|
| sld (Presentation Slide) | §19.2.2.14 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OutlineViewSlideList](#)) is located in §A.3. *end note*]

19.2.2.16 [slideViewPr \(Slide View Properties\)](#)

This element functions as a parent element within which all view properties associated with the slide view mode are contained. All properties are defined within the child elements.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|---|------------|
| cSldViewPr (Common Slide View Properties) | §19.2.2.1 |
| extLst (Extension List) | §19.2.1.12 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideViewProperties](#)) is located in §A.3. *end note*]

19.2.2.17 [sorterViewPr \(Slide Sorter View Properties\)](#)

This element functions as a parent element within which all view properties associated with the slide sorter view mode are contained. All properties are defined within the child elements.

The slide sorter view displays thumbnails of multiple slides at once; the number of slides and size of thumbnails depends on the scaling factor of the view.

| Parent Elements |
|---------------------|
| viewPr (§19.2.2.18) |

| Child Elements | Subclause |
|----------------------------------|------------|
| cViewPr (Common View Properties) | §19.2.2.2 |
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|----------------------------------|---|
| showFormatting (Show Formatting) | Specifies whether to show associated slide formatting when in slide sorter view mode. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SlideSorterViewProperties](#)) is located in §A.3. *end note*]

19.2.2.18 viewPr (Presentation-wide View Properties)

This element functions as a parent element within which all presentation-wide view properties are contained. All properties and their corresponding settings are defined within the child elements.

| Parent Elements |
|---|
| Root element of PresentationML View Properties part |

| Child Elements | Subclause |
|--|------------|
| extLst (Extension List) | §19.2.1.12 |
| gridSpacing (Grid Spacing) | §19.2.2.3 |
| normalViewPr (Normal View Properties) | §19.2.2.6 |
| notesTextViewPr (Notes Text View Properties) | §19.2.2.7 |
| notesViewPr (Notes View Properties) | §19.2.2.8 |
| outlineViewPr (Outline View Properties) | §19.2.2.10 |
| slideViewPr (Slide View Properties) | §19.2.2.16 |
| sorterViewPr (Slide Sorter View Properties) | §19.2.2.17 |

| Attributes | Description |
|------------------------------|---|
| lastView (Last View) | Specifies the view mode that was used when the presentation document was last saved. The possible values for this attribute are defined by the ST_ViewType simple type (§19.7.55). |
| showComments (Show Comments) | Specifies whether the slide comments should be shown. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ViewProperties](#)) is located in §A.3. *end note*]

19.3 Slides

The Slides portion of the PresentationML framework stores all information pertaining specifically to slides of various slide types. These slide types and corresponding parts can be broken down into three distinct parts, namely slides, embedded objects, and programmable tags.

19.3.1 Slides

Being the main segment of this section of PresentationML, the slides elements encompass all data that is to be contained within a slide. The best way to think of a slide is a container for all data that is to be on that slide. The specific shapes, images and relations within a slide do not come into play here. The elements here pertain to the six different slide types that can be described within PresentationML, namely slide, slide layout, slide master, handout master, notes master and notes slide.

19.3.1.1 **bg** (Slide Background)

This element specifies the background appearance information for a slide. The slide background covers the entire slide and is visible where no objects exist and as the background for transparent objects.

| Parent Elements |
|-------------------|
| cSld (§19.3.1.16) |

| Child Elements | Subclause |
|------------------------------------|-----------|
| bgPr (Background Properties) | §19.3.1.2 |
| bgRef (Background Style Reference) | §19.3.1.3 |

| Attributes | Description |
|-------------------------------|--|
| bwMode (Black and White Mode) | <p>Specifies that the background should be rendered using only black and white coloring. That is, the coloring information for the background should be converted to either black or white when rendering the picture.</p> <p>[<i>Note</i>: No gray is to be used in rendering this background, only stark black and stark white. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p> |

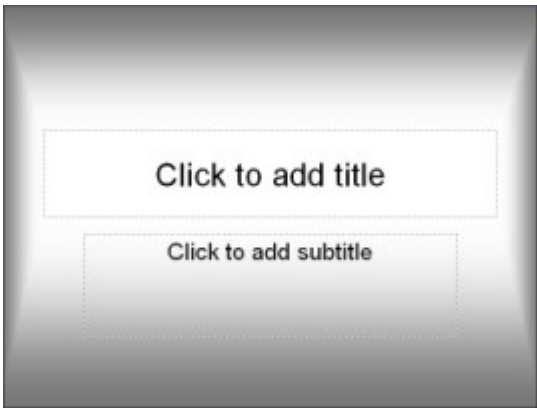

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Background](#)) is located in §A.3. *end note*]

19.3.1.2 **bgPr** (Background Properties)

This element specifies visual effects used to render the slide background. This includes any fill, image, or effects that are to make up the background of the slide.

| Parent Elements |
|-----------------|
| bg (§19.3.1.1) |

| Child Elements | Subclause |
|------------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| effectDag (Effect Container) | §20.1.8.25 |
| effectLst (Effect Container) | §20.1.8.26 |
| extLst (Extension List) | §19.2.1.12 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

| Attributes | Description |
|----------------------------------|---|
| shadeToTitle (Shade to Title) | <p>Specifies whether the background of the slide is of a shade to title background type. This kind of gradient fill is on the slide background and changes based on the placement of the slide title placeholder. An example is shown below.</p>  <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_BackgroundProperties](#)) is located in §A.3. end note]

19.3.1.3 [bgRef \(Background Style Reference\)](#)

This element specifies the slide background is to use a fill style defined in the style matrix. The `idx` attribute refers to the index of a background fill style or fill style within the presentation's style matrix, defined by the `fmtScheme` element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the `fillStyleLst` element, and values 1001 and above refer to the index of a background fill style within

the `bgFillStyleLst` element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[Example:

```
<p:bgRef idx="2">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's second fill style using the second background color of the color scheme.

end example]

[Example:

```
<p:bgRef idx="1001">
  <a:schemeClr val="bg2"/>
</p:bgRef>
```

The above code indicates a slide background with the style's first background fill style using the second background color of the color scheme.

end example]

| Parent Elements |
|-----------------|
| bg (§19.3.1.1) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|--|---|
| idx (Style Matrix Index) Namespace: http://purl.oclc.org | Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the <code>ST_StyleMatrixColumnIndex</code> simple type (§20.1.10.56). |

| Attributes | Description |
|----------------------------|-------------|
| g/ooxml/drawing ml/main | |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

19.3.1.4 **blipFill (Picture Fill)**

This element specifies the kind of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[*Example:* Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```
<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
...
</p:pic>
```

The above picture object is shown as an example of this fill type. *end example*]

[*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```

<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
<p:spPr>
  <a:gradFill>
    <a:gsLst>
      <a:gs pos="0">
        <a:schemeClr val="tx2">
          <a:shade val="50000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="39999">
        <a:schemeClr val="tx2">
          <a:tint val="20000"/>
        </a:schemeClr>
      </a:gs>
      <a:gs pos="70000">
        <a:srgbClr val="C4D6EB"/>
      </a:gs>
      <a:gs pos="100000">
        <a:schemeClr val="bg1"/>
      </a:gs>
    </a:gsLst>
  </a:gradFill>
</p:spPr>
...
</p:pic>

```

The above picture object is shown as an example of this double fill type. *end example*]

| Parent Elements |
|------------------|
| pic (§19.3.1.37) |

| Child Elements | Subclause |
|----------------------------|------------|
| blip (Blip) | §20.1.8.13 |
| srcRect (Source Rectangle) | §20.1.8.55 |
| stretch (Stretch) | §20.1.8.56 |
| tile (Tile) | §20.1.8.58 |

| Attributes | Description |
|---|---|
| dpi (DPI Setting) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.</p> <p>[<i>Note</i>: This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| rotWithShape (Rotate With Shape) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note: The W3C XML Schema definition of this element's content model ([CT_BlipFillProperties](#)) is located in §A.4.1. end note*]

19.3.1.5 [bodyStyle \(Slide Master Body Text Style\)](#)

This element specifies the text formatting style for all body text within a master slide. This formatting is used on all body text within presentation slides related to this master. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the bodyStyle element there can be many different style types defined as there are different kinds of text stored within the body of a slide.

| Parent Elements |
|-----------------------|
| txStyles (§19.3.1.52) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| defPPr (Default Paragraph Style) | §21.1.2.2.2 |
| extLst (Extension List) | §20.1.2.2.15 |
| lvl1pPr (List Level 1 Text Style) | §21.1.2.4.13 |
| lvl2pPr (List Level 2 Text Style) | §21.1.2.4.14 |
| lvl3pPr (List Level 3 Text Style) | §21.1.2.4.15 |
| lvl4pPr (List Level 4 Text Style) | §21.1.2.4.16 |
| lvl5pPr (List Level 5 Text Style) | §21.1.2.4.17 |
| lvl6pPr (List Level 6 Text Style) | §21.1.2.4.18 |
| lvl7pPr (List Level 7 Text Style) | §21.1.2.4.19 |
| lvl8pPr (List Level 8 Text Style) | §21.1.2.4.20 |
| lvl9pPr (List Level 9 Text Style) | §21.1.2.4.21 |

[*Note: The W3C XML Schema definition of this element's content model ([CT_TextListStyle](#)) is located in §A.4.1. end note*]

19.3.1.6 [clrMap \(Color Scheme Map\)](#)

This element specifies the mapping layer that transforms one color scheme definition to another. Each attribute represents a color name that can be referenced in this master, and the value is the corresponding color in the theme.

[*Example: Consider the following mapping of colors that applies to a slide master:*

```
<p:clrMap bg1="dk1" tx1="lt1" bg2="dk2" tx2="lt2" accent1="accent1"
accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

| Parent Elements |
|--|

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|--|--|
| accent1 (Accent 1) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent2 (Accent 2) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent3 (Accent 3) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent4 (Accent 4) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent5 (Accent 5) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |

| Attributes | Description |
|---|--|
| accent6 (Accent 6) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg1 (Background 1) Namespace: http://purl.oclc.org/ooxml/drawingml/main | A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg2 (Background 2) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| folHlink (Followed Hyperlink) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| hlink (Hyperlink) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the color for a hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx1 (Text 1) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx2 (Text 2) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. *end note*]

19.3.1.7 [clrMapOvr \(Color Scheme Map Override\)](#)

This element provides a mechanism with which to override the color schemes listed within the ClrMap element. If the masterClrMapping element is present, the color scheme defined by the master is used. If the overrideClrMapping element is present, it defines a new color scheme specific to the parent notes slide, presentation slide, or slide layout.

| Parent Elements |
|--|
| notes (§19.3.1.26); sld (§19.3.1.38); sldLayout (§19.3.1.39) |

| Child Elements | Subclause |
|---|-----------|
| masterClrMapping (Master Color Mapping) | §20.1.6.6 |
| overrideClrMapping (Override Color Mapping) | §20.1.6.8 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ColorMappingOverride](#)) is located in §A.4.1. *end note*]

19.3.1.8 [cNvCxnSpPr \(Non-Visual Connector Shape Drawing Properties\)](#)

This element specifies the non-visual drawing properties specific to a connector shape. This includes information specifying the shapes to which the connector shape is connected.

| Parent Elements |
|------------------------|
| nvCxnSpPr (§19.3.1.29) |

| Child Elements | Subclause |
|-------------------------------------|--------------|
| cxnSpLocks (Connection Shape Locks) | §20.1.2.2.11 |
| endCxn (Connection End) | §20.1.2.2.13 |
| extLst (Extension List) | §20.1.2.2.15 |
| stCxn (Connection Start) | §20.1.2.2.36 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualConnectorProperties](#)) is located in §A.4.1. *end note*]

19.3.1.9 [cNvGraphicFramePr \(Non-Visual Graphic Frame Drawing Properties\)](#)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

| Parent Elements |
|-------------------------------|
| nvGraphicFramePr (§19.3.1.30) |

| Child Elements | Subclause |
|---|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| graphicFrameLocks (Graphic Frame Locks) | §20.1.2.2.19 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

19.3.1.10 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

| Parent Elements |
|------------------------|
| nvGrpSpPr (§19.3.1.31) |

| Child Elements | Subclause |
|--------------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| grpSpLocks (Group Shape Locks) | §20.1.2.2.21 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualGroupDrawingShapeProps](#)) is located in §A.4.1. *end note*]

19.3.1.11 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example:* Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  <p:cNvPicPr>
    <a:picLocks noChangeAspect="1"/>
  </p:cNvPicPr>
</p:nvPicPr>
</p:pic>
```

...
</p:pic>

end example]

| Parent Elements |
|----------------------|
| nvPicPr (§19.3.1.32) |

| Child Elements | Subclause |
|--------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| picLocks (Picture Locks) | §20.1.2.2.31 |

| Attributes | Description |
|---|---|
| preferRelativeResi ze (Relative Resize Preferred) | Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size. |
| Namespace: http://purl.oclc.or g/ooxml/drawing ml/main | <p>[<i>Example</i>: Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. *end note*]

19.3.1.12 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
```

```

    </p:nvPicPr>
    ...
  </p:pic>

```

end example]

| Parent Elements |
|--|
| nvCxnSpPr (§19.3.1.29); nvGraphicFramePr (§19.3.1.30); nvGrpSpPr (§19.3.1.31); nvPicPr (§19.3.1.32); nvSpPr (§19.3.1.34) |

| Child Elements | Subclause |
|----------------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| hlinkClick (Click Hyperlink) | §21.1.2.3.5 |
| hlinkHover (Hyperlink for Hover) | §20.1.2.2.23 |

| Attributes | Description |
|--|---|
| <p>descr (Alternative Text for Object)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p> | <p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> <p>[<i>Example:</i> Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>hidden (Hidden)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p> | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note:</i> An application can have settings which allow this object to be viewed. <i>end note]</i></p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example:</i> Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> |

| Attributes | Description |
|---|--|
| | <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| <p>id (Unique Identifier)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p> | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 758 678 789"><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p> |
| <p>name (Name)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p> | <p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file name of a picture object. <i>end note</i>]</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 1199 776 1230">< ... name="foo.jpg" ></pre> <p>The name attribute has a value of foo.jpg, which is the name of this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| <p>title (Title)</p> <p>Namespace: http://purl.oclc.org/ooxml/drawingml/main</p> | <p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre data-bbox="451 1671 971 1703"><... title="Process Flow Diagram"></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

19.3.1.13 cNvSpPr (Non-Visual Drawing Properties for a Shape)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example:* Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
  ...
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

| Parent Elements |
|---------------------|
| nvSpPr (§19.3.1.34) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| spLocks (Shape Locks) | §20.1.2.2.34 |

| Attributes | Description |
|--|--|
| txBBox (Text Box) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.</p> <p>[<i>Note:</i> Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingShapeProps](#)) is located in §A.4.1. *end note*]

19.3.1.14 contentPart (Content Part)

This element specifies a reference to XML content in a format not defined by ECMA-376. [*Note:* This part allows the native use of other commonly used interchange formats, such as:

- MathML (<http://www.w3.org/TR/MathML2/>)
- SMIL (<http://www.w3.org/TR/REC-smil/>)
- SVG (<http://www.w3.org/TR/SVG11/>)

end note]

The relationship type of the explicit relationship specified by this element shall be <http://purl.oclc.org/ooxml/officeDocument/relationships/customXml> and have a TargetMode attribute value of Internal. If an application cannot process content of the content type specified by the targeted part, then it should continue to process the file. If possible, it should also provide some indication that unknown content was not imported.

[*Note:* For better interoperability, only standard XML formats should be used. *end note*]

[*Example:* Consider a PresentationML document which includes the following SMIL markup in a part named `smil1.xml`:

```
<!--
    Copyright: Copyright 1998-2001 W3C (MIT, INRIA, Keio), All Rights

    See http://www.w3.org/Consortium/Legal/.
    Author: Aaron Cohen (Intel)
        Version: February 7, 2001
        Module: Animation Module
        Feature: animation
        File Name: animation-add-BE-05.smil
    Media Components: none
    Expected Behavior: Nine red rectangles numbered 1 to 9 shrink to squares
                      over 2s as follows:
                        at 2s #1 shrinks.
                        at 5s #2 shrinks, 1s after #1 completes
                        at 8s #3 shrinks.
                        #4 shrinks when it is clicked on.
                        #5 shrinks 1s after it is clicked on.
                        #6 shrinks 2s after it is clicked on.
                        #7 shrinks when the accesskey '1' is pressed.
```

#8 should be shrunk from 0s since it's wallclock time is in the past.

#9 will not shrink unless a DOM call causes it to begin.

-->

```

</smil>
```

A Slide Part would reference this content as follows:

```
<p:spTree>
...
<p:contentPart r:id="smil01"/>
...
</p:spTree>
```

The contentPart element specifies that the content targeted by the relationship with an ID of smil01 is part of the PresentationML document. Examining the contents of the corresponding relationship part item, we can see the targets for that relationship:

```
<Relationships ... >
...
<Relationship Id="smil01" TargetMode="Internal"
Type="http://purl.oclc.org/ooxml/officeDocument/relationships/customXml"
Target="smil1.xml" />
...
</Relationships>
```

The corresponding relationship part item shows that the SMIL content is located next to the slide and is named smil1.xml. *end example]*

| Parent Elements |
|---|
| grpSp (§19.3.1.22); spTree (§19.3.1.45) |

| Attributes | Description |
|---------------------|--|
| id (Relationship to | Specifies the relationship ID to a content part. |

| Attributes | Description |
|--|---|
| Part) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | <p>[<i>Example:</i> Consider an XML element which has the following id attribute:</p> <pre><... r:id="rId1" /></pre> <p>The markup specifies the associated relationship part with relationship ID rId1 contains the corresponding relationship information for the parent XML element. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Rel](#)) is located in §A.3. *end note*]

19.3.1.15 controls (List of controls)

This element specifies a list of embedded controls for the corresponding slide. Custom embedded controls can be embedded on slides.

| Parent Elements |
|-------------------|
| cSld (§19.3.1.16) |

| Child Elements | Subclause |
|----------------------------|-----------|
| control (Embedded Control) | §19.3.2.1 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ControlList](#)) is located in §A.3. *end note*]

19.3.1.16 cSld (Common Slide Data)

This element specifies a container for slide information that is relevant to all of the slide types. All slides share a common set of properties that is independent of the slide type; the description of these properties for any particular slide is stored within the slide's cSld container. Slide data specific to the slide type indicated by the parent element is stored elsewhere.

[*Note:* The actual data in cSld describe only the particular parent slide; it is only the kind of information stored that is common across all slides. *end note*]

[*Example:* Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
```

```

    ...
    </p:spTree>
  </p:cSld>
  ...
</p:sld>

```

As the above example shows, the shape tree of a slide (spTree) is a child element of cSld because all slide types can contain a shape tree. Other slide properties specific to the slide type (such as transitions for sld slides) are specified elsewhere. *end example*

| Parent Elements |
|--|
| handoutMaster (§19.3.1.24); notes (§19.3.1.26); notesMaster (§19.3.1.27); sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42) |

| Child Elements | Subclause |
|----------------------------------|------------|
| bg (Slide Background) | §19.3.1.1 |
| controls (List of controls) | §19.3.1.15 |
| custDataLst (Customer Data List) | §19.3.1.18 |
| extLst (Extension List) | §19.2.1.12 |
| spTree (Shape Tree) | §19.3.1.45 |

| Attributes | Description |
|-------------|--|
| name (Name) | <p>Specifies the slide name property that is used to further identify this unique configuration of common slide data. This might be used to aid in distinguishing different slide layouts or various other slide types.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_CommonSlideData](#)) is located in §A.3. *end note*]

19.3.1.17 custData (Customer Data)

This element specifies customer data which allows for the specifying and persistence of customer specific data within the presentation.

| Parent Elements |
|--------------------------|
| custDataLst (§19.3.1.18) |

| Attributes | Description |
|---|--|
| id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | This attribute specifies the relationship id for referencing other resources outside the scope of the current PresentationML file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomerData](#)) is located in §A.3. *end note*]

19.3.1.18 [custDataLst \(Customer Data List\)](#)

This element allows for the specifying of customer defined data within the PresentationML framework. References to custom data or tags can be defined within this list.

| Parent Elements |
|---|
| cSld (§19.3.1.16); nvPr (§19.3.1.33); presentation (§19.2.1.26) |

| Child Elements | Subclause |
|---------------------------|------------|
| custData (Customer Data) | §19.3.1.17 |
| tags (Customer Data Tags) | §19.3.1.47 |

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomerDataList](#)) is located in §A.3. *end note*]

19.3.1.19 [cxnSp \(Connection Shape\)](#)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[Example: Consider the following connector shape that connects two regular shapes.

```
<p:spTree>
```

```
...
```

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="1" name="Rectangle 1"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  ...
</p:sp>
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 2"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  ...
</p:sp>
<p:cxnSp>
  <p:nvCxnSpPr>
    <p:cNvPr id="3" name="Elbow Connector 3"/>
    <p:cNvCxnSpPr>
      <a:stCxn id="1" idx="3"/>
      <a:endCxn id="2" idx="1"/>
    </p:cNvCxnSpPr>
    <p:nvPr/>
  </p:nvCxnSpPr>
  ...
</p:cxnSp>
</p:spTree>
```

end example]

| Parent Elements |
|---|
| grpSp (§19.3.1.22); spTree (§19.3.1.45) |

| Child Elements | Subclause |
|--|------------|
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| nvcxnSpPr (Non-Visual Properties for a Connection Shape) | §19.3.1.29 |
| spPr (Shape Properties) | §19.3.1.44 |
| style (Shape Style) | §19.3.1.46 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Connector](#)) is located in §A.3. *end note*]

19.3.1.20 [extLst \(Extension List with Modification Flag\)](#)

This element specifies the extension list with modification ability within which all future extensions of element type `ext` are defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the PresentationML framework. This allows for various new kinds of data to be stored natively within the framework.

[*Note:* Using this `extLst` element allows the generating application to store whether this extension property has been modified. *end note*]

| Parent Elements |
|---|
| cm (§19.4.1); cxnSp (§19.3.1.19); graphicFrame (§19.3.1.21); grpSp (§19.3.1.22); handoutMaster (§19.3.1.24); hf (§19.3.1.25); notes (§19.3.1.26); notesMaster (§19.3.1.27); ph (§19.3.1.36); pic (§19.3.1.37); sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42); sp (§19.3.1.43); spTree (§19.3.1.45); timing (§19.3.1.48); transition (§19.3.1.50) |

| Child Elements | Subclause |
|-----------------|------------|
| ext (Extension) | §19.2.1.11 |

| Attributes | Description |
|--------------|--|
| mod (Modify) | <p>This attribute specifies whether the data contained within this element has been modified and should thus be processed again by the generating application.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ExtensionListModify](#)) is located in §A.3. *end note*]

19.3.1.21 [graphicFrame \(Graphic Frame\)](#)

This element specifies the existence of a graphics frame. This frame contains a graphic that was generated by an external source and needs a container in which to be displayed on the slide surface.

| Parent Elements |
|---|
| grpSp (§19.3.1.22); spTree (§19.3.1.45) |

| Child Elements | Subclause |
|--|--------------|
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| graphic (Graphic Object) | §20.1.2.2.16 |
| nvGraphicFramePr (Non-Visual Properties for a Graphic Frame) | §19.3.1.30 |
| xfrm (2D Transform for Graphic Frame) | §19.3.1.53 |

| Attributes | Description |
|---|---|
| bwMode (Black and White Mode) Namespace: .../drawingml/2006/main | Specifies how the graphical object should be rendered, using color, black or white, or grayscale. [Note: This does not mean that the graphical object itself is stored with only black and white or grayscale information. This attribute instead sets the rendering mode that the graphical object uses. end note] The possible values for the attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_GraphicalObjectFrame](#)) is located in §A.3. end note]

19.3.1.22 [grpSp \(Group Shape\)](#)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[Example: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
  <p:grpSpPr>
    <a:xfrm>
      <a:off x="838200" y="990600"/>
      <a:ext cx="2426208" cy="978408"/>
      <a:chOff x="838200" y="990600"/>
      <a:chExt cx="2426208" cy="978408"/>
    </a:xfrm>
  </p:grpSpPr>
</p:grpSp>
```

```

</p:grpSpPr>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
</p:grpSp>

```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

| Parent Elements |
|---|
| grpSp (§19.3.1.22); spTree (§19.3.1.45) |

| Child Elements | Subclause |
|---|------------|
| contentPart (Content Part) | §19.3.1.14 |
| cxnSp (Connection Shape) | §19.3.1.19 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| graphicFrame (Graphic Frame) | §19.3.1.21 |
| grpSp (Group Shape) | §19.3.1.22 |
| grpSpPr (Group Shape Properties) | §19.3.1.23 |
| nvGrpSpPr (Non-Visual Properties for a Group Shape) | §19.3.1.31 |

| Attributes | Description |
|--|---|
| bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | <p>Specifies that the group shape should be rendered using only black and white coloring. That is the coloring information for the group shape should be converted to either black or white when rendering the corresponding shapes.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the group shapes themselves are stored with only black and white color information. This attribute instead sets the rendering mode that the shapes use when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GroupShapeProperties](#)) is located in §A.4.1. *end note*]

19.3.1.24 handoutMaster (Handout Master)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached

text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

| Parent Elements |
|--|
| Root element of PresentationML Handout Master part |

| Child Elements | Subclause |
|---|------------|
| clrMap (Color Scheme Map) | §19.3.1.6 |
| cSld (Common Slide Data) | §19.3.1.16 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| hf (Header/Footer information for a slide master) | §19.3.1.25 |

[Note: The W3C XML Schema definition of this element's content model ([CT_HandoutMaster](#)) is located in §A.3. *end note*]

19.3.1.25 hf (Header/Footer information for a slide master)

This element specifies the header and footer information for a slide. Headers and footers consist of placeholders for text that should be consistent across all slides and slide types, such as a date and time, slide numbering, and custom header and footer text.

| Parent Elements |
|--|
| handoutMaster (§19.3.1.24); notesMaster (§19.3.1.27); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42) |

| Child Elements | Subclause |
|--|------------|
| extLst (Extension List with Modification Flag) | §19.3.1.20 |

| Attributes | Description |
|----------------------------|--|
| dt (Date/Time Placeholder) | Specifies whether the Date/Time placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| fttr (Footer Placeholder) | Specifies whether the Footer placeholder is enabled for this master. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| hdr (Header) | Specifies whether the Header placeholder is enabled for this master. If this attribute is |

| Attributes | Description |
|-----------------------------------|---|
| Placeholder) | not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sldNum (Slide Number Placeholder) | Specifies whether the slide number placeholder is enabled. If this attribute is not specified, a value of true should be assumed by the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_HeaderFooter](#)) is located in §A.3. *end note*]

19.3.1.26 notes (Notes Slide)

This element specifies the existence of a notes slide along with its corresponding data. Contained within a notes slide are all the common slide elements along with addition properties that are specific to the notes element.

[*Example*: Consider the following PresentationML notes slide

```
<p:notes>
  <p:cSld>
    ...
  </p:cSld>
  ...
</p:notes>
```

In the above example a notes element specifies the existence of a notes slide with all of its parts. Notice the cSld element, that specifies the common elements that can appear on any slide type and then any elements specify additional non-common properties for this notes slide. *end example*]

| Parent Elements |
|---|
| Root element of PresentationML Notes Slide part |

| Child Elements | Subclause |
|--|------------|
| clrMapOvr (Color Scheme Map Override) | §19.3.1.7 |
| cSld (Common Slide Data) | §19.3.1.16 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |

| Attributes | Description |
|---|---|
| showMasterPhAnim (Show Master Placeholder Animations) | Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showMasterSp (Show Master Shapes) | Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_NotesSlide](#)) is located in §A.3. *end note*]

19.3.1.27 [notesMaster \(Notes Master\)](#)

This element specifies an instance of a handout master slide. Within a handout master slide are contained all elements that describe the objects and their corresponding formatting for within a handout slide. Within a handout master slide the cSld element specifies the common slide elements such as shapes and their attached text bodies. There are other properties within a handout master slide but cSld encompasses the majority of the intended purpose for a handoutMaster slide.

| Parent Elements |
|--|
| Root element of PresentationML Notes Master part |

| Child Elements | Subclause |
|---|------------|
| clrMap (Color Scheme Map) | §19.3.1.6 |
| cSld (Common Slide Data) | §19.3.1.16 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| hf (Header/Footer information for a slide master) | §19.3.1.25 |
| notesStyle (Notes Text Style) | §19.3.1.28 |

[Note: The W3C XML Schema definition of this element's content model ([CT_NotesMaster](#)) is located in §A.3. *end note*]

19.3.1.28 [notesStyle \(Notes Text Style\)](#)

This element specifies the text formatting style for the all other text within a notes slide. This formatting is used on all text within the corresponding notes slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the notesStyle element there can be many different style types defined as there are different kinds of text stored within a notes slide.

19.3.1.29 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

| Parent Elements |
|--------------------|
| cxnSp (§19.3.1.19) |

| Child Elements | Subclause |

19.3.1.32 **nvPicPr (Non-Visual Properties for a Picture)**

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following PresentationML.

```
<p:pic>
...
<p:nvPicPr>
...
</p:nvPicPr>
...
</p:pic>
```

end example]

| Parent Elements |

| wavAudioFile (Audio from WAV File) | §20.1.3.7 |

| Attributes | Description |
|----------------------------|---|
| isPhoto (Is a Photo Album) | Specifies whether the picture belongs to a photo album and should thus be included when editing a photo album within the generating application. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| userDrawn (Is User Drawn) | Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_ApplicationNonVisualDrawingProps](#)) is located in §A.3. *end note*]

19.3.1.34 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

| Parent Elements |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ShapeNonVisual](#)) is located in §A.3. *end note*]

19.3.1.35 **otherStyle (Slide Master Other Text Style)**

This element specifies the text formatting style for the all other text within a master slide. This formatting is used on all text not covered by the titleStyle or bodyStyle elements within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within the otherStyle element there can be many different style types defined as there are different kinds of text stored within a slide.

[*Note*: The otherStyle element is to be used for specifying the text formatting of text within a slide shape but not within a text box. Text box styling is handled from within the bodyStyle element. *end note*]

| Parent Elements |
|-----------------------|
| txStyles (§19.3.1.52) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| defPPr (Default Paragraph Style) | §21.1.2.2.2 |
| extLst (Extension List) | §20.1.2.2.15 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TextListStyle](#)) is located in §A.4.1. *end note*]

19.3.1.36 **ph (Placeholder Shape)**

This element specifies that the corresponding shape should be represented by the generating application as a placeholder. When a shape is considered a placeholder by the generating application it can have special properties to alert the user that they can enter content into the shape. Different placeholder types are allowed and can be specified by using the placeholder type attribute for this element.

| Parent Elements |
|-------------------|
| nvPr (§19.3.1.33) |

| Child Elements | Subclause |
|--|------------|
| extLst (Extension List with Modification Flag) | §19.3.1.20 |

| Attributes | Description |
|---|---|
| hasCustomPrompt (Placeholder has custom prompt) | Specifies whether the corresponding placeholder should have a custom prompt or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| idx (Placeholder Index) | Specifies the placeholder index. This is used when applying templates or changing layouts to match a placeholder on one template/master to another. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| orient (Placeholder Orientation) | Specifies the orientation of a placeholder. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |
| sz (Placeholder Size) | Specifies the size of a placeholder. The possible values for this attribute are defined by the ST_PlaceholderSize simple type (§19.7.9). |
| type (Placeholder Type) | Specifies what content type a placeholder is intended to contain. The possible values for this attribute are defined by the ST_PlaceholderType simple type (§19.7.10). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Placeholder](#)) is located in §A.3. *end note*]

19.3.1.37 [pic \(Picture\)](#)

This element specifies the existence of a picture object within the document.

[Example: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
```

```
<p:cNvPicPr>
  <a:picLocks noChangeAspect="1"/>
</p:cNvPicPr>
<p:nvPr/>
</p:nvPicPr>
<p:blipFill>
  ...
</p:blipFill>
<p:spPr>
  ...
</p:spPr>
</p:pic>
```

end example]

| Parent Elements |
|--|
| control (§19.3.2.1); grpSp (§19.3.1.22); oleObj (§19.3.2.4); spTree (§19.3.1.45) |

| Child Elements | Subclause |

| blipFill (Picture Fill) | §19.3.1.4 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| nvpicPr (Non-Visual Properties for a Picture) | §19.3.1.32 |
| spPr (Shape Properties) | §19.3.1.44 |
| style (Shape Style) | §19.3.1.46 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT Picture](#)) is located in §A.3. *end note*]

19.3.1.38 **sld (Presentation Slide)**

This element specifies a slide within a slide list. The slide list is used to specify an ordering of slides.

[*Example:* Consider the following custom show with an ordering of slides.

```
<p:custShowLst>
  <p:custShow name="Custom Show 1" id="0">
    <p:sldLst>
      <p:sld r:id="rId4"/>
      <p:sld r:id="rId3"/>
      <p:sld r:id="rId2"/>
      <p:sld r:id="rId5"/>
    </p:sldLst>
```

```
</p:custShow>
</p:custShowLst>
```

In the above example the order specified to present the slides is slide 4, then 3, 2 and finally 5. *end example*]

| Parent Elements |
|---|
| Root element of PresentationML Slide part |

| Child Elements | Subclause |
|--|------------|
| clrMapOvr (Color Scheme Map Override) | §19.3.1.7 |
| cSld (Common Slide Data) | §19.3.1.16 |

| transition (Slide Transition for a Slide Layout) | §19.3.1.50 |

| Attributes | Description |
|---|---|
| show (Show Slide in Slide Show) | Specifies that the current slide should be shown in slide show. If this attribute is omitted then a value of true is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showMasterPhAnim (Show Master Placeholder Animations) | Specifies whether or not to display animations on placeholders from the master slide. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| showMasterSp (Show Master Shapes) | Specifies if shapes on the master slide should be shown on slides or not. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Slide](#)) is located in §A.3. *end note*]

19.3.1.39 sldLayout (Slide Layout)

This element specifies an instance of a slide layout. The slide layout contains in essence a template slide design that can be applied to any existing slide. When applied to an existing slide all corresponding content should be mapped to the new slide layout.

| Parent Elements |
|--|
| Root element of PresentationML Slide Layout part |

| Child Elements | Subclause |
|--|------------|
| clrMapOvr (Color Scheme Map Override) | §19.3.1.7 |
| cSld (Common Slide Data) | §19.3.1.16 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| hf (Header/Footer information for a slide master) | §19.3.1.25 |
| timing (Slide Timing Information for a Slide Layout) | §19.3.1.48 |
| transition (Slide Transition for a Slide Layout) | §19.3.1.50 |

| Attributes | Description |
|---|--|
| matchingName (Matching Name) | <p>Specifies a name to be used in place of the name attribute within the cSld element. This is used for layout matching in response to layout changes and template applications.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| preserve (Preserve Slide Layout) | <p>Specifies whether the corresponding slide layout is deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| showMasterPhAnim (Show Master Placeholder Animations) | <p>Specifies whether or not to display animations on placeholders from the master slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| showMasterSp (Show Master Shapes) | <p>Specifies if shapes on the master slide should be shown on slides or not.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| type (Slide Layout Type) | <p>Specifies the slide layout type that is used by this slide.</p> <p>The possible values for this attribute are defined by the ST_SlideLayoutType simple type (§19.7.15).</p> |
| userDrawn (Is User Drawn) | <p>Specifies if the corresponding object has been drawn by the user and should thus not be deleted. This allows for the flagging of slides that contain user drawn data.</p> |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideLayout](#)) is located in §A.3. *end note*]

19.3.1.40 [sldLayoutId \(Slide Layout Id\)](#)

This element specifies the relationship information for each slide layout that is used within the slide master. The slide master has relationship identifiers that it uses internally for determining the slide layouts that should be used. Then, to resolve what these slide layouts should be the sldLayoutId elements in the sldLayoutIdLst are utilized.

| Parent Elements |
|-----------------------------|
| sldLayoutIdLst (§19.3.1.41) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|--|---|
| id (ID Tag) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship id value that the generating application can use to resolve which slide layout is used in the creation of the slide. This relationship id is used within the relationship file for the master slide to expose the location of the corresponding layout file within the presentation. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| id (ID Tag) | Specifies the identification number that uniquely identifies this slide layout within the presentation file. The possible values for this attribute are defined by the ST_SlideLayoutId simple type (§19.7.14). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideLayoutIdListEntry](#)) is located in §A.3. *end note*]

19.3.1.41 [sldLayoutIdLst \(List of Slide Layouts\)](#)

This element specifies the existence of the slide layout identification list. This list is contained within the slide master and is used to determine which layouts are being used within the slide master file. Each layout within the

list of slide layouts has its own identification number and relationship identifier that uniquely identifies it within both the presentation document and the particular master slide within which it is used.

| Parent Elements |
|------------------------|
| sldMaster (§19.3.1.42) |

| Child Elements | Subclause |
|-------------------------------|------------|
| sldLayoutId (Slide Layout Id) | §19.3.1.40 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT SlideLayoutIdList](#)) is located in §A.3. *end note*]

19.3.1.42 sldMaster (Slide Master)

This element specifies an instance of a slide master slide. Within a slide master slide are contained all elements that describe the objects and their corresponding formatting for within a presentation slide. Within a slide master slide are two main elements. The cSld element specifies the common slide elements such as shapes and their attached text bodies. Then the txStyles element specifies the formatting for the text within each of these shapes. The other properties within a slide master slide specify other properties for within a presentation slide such as color information, headers and footers, as well as timing and transition information for all corresponding presentation slides.

| Parent Elements |
|--|
| Root element of PresentationML Slide Master part |

| Child Elements | Subclause |
|--|------------|
| clrMap (Color Scheme Map) | §19.3.1.6 |
| cSld (Common Slide Data) | §19.3.1.16 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| hf (Header/Footer information for a slide master) | §19.3.1.25 |
| sldLayoutIdLst (List of Slide Layouts) | §19.3.1.41 |
| timing (Slide Timing Information for a Slide Layout) | §19.3.1.48 |
| transition (Slide Transition for a Slide Layout) | §19.3.1.50 |
| txStyles (Slide Master Text Styles) | §19.3.1.52 |

| Attributes | Description |
|----------------------------------|---|
| preserve (Preserve Slide Master) | Specifies whether the corresponding slide layout is deleted when all the slides that follow that layout are deleted. If this attribute is not specified then a value of false should be |

| Attributes | Description |
|------------|--|
| | <p>assumed by the generating application. This would mean that the slide would in fact be deleted if no slides within the presentation were related to it.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideMaster](#)) is located in §A.3. *end note*]

19.3.1.43 [sp \(Shape\)](#)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

| Parent Elements |
|---|

| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| prstGeom (Preset geometry) | §20.1.9.18 |
| scene3d (3D Scene Properties) | §20.1.4.1.26 |
| solidFill (Solid Fill) | §20.1.8.54 |
| sp3d (Apply 3D shape properties) | §20.1.5.12 |
| xfrm (2D Transform for Individual Objects) | §20.1.7.6 |

| Attributes | Description |
|---|--|
| bwMode (Black and White Mode) Namespace: http://purl.oclc.org/ooxml/drawing/ml/main | <p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note:</i> This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

19.3.1.45 `spTree` (Shape Tree)

This element specifies all shape-based objects, either grouped or not, that can be referenced on a given slide. As most objects within a slide are shapes, this represents the majority of content within a slide. Text and effects are attached to shapes that are contained within the `spTree` element.

[Example: Consider the following PresentationML slide

```
<p:sld>
  <p:cSld>
    <p:spTree>
      <p:nvGrpSpPr>
        ...
      </p:nvGrpSpPr>
      <p:grpSpPr>
        ...
      </p:grpSpPr>
      <p:sp>
        ...
      </p:sp>
    </p:spTree>
  </p:cSld>
  ...
</p:sld>
```

In the above example the shape tree specifies all the shape properties for this slide. *end example*]

Each shape-based object within the shape tree, whether grouped or not, shall represent one unique level of z-ordering on the slide. The z-order for each shape-based object shall be determined by the lexical ordering of each shape-based object within the shape tree: the first shape-based object shall have the lowest z-order, while the last shape-based object shall have the highest z-order.

The z-ordering of shape-based objects within the shape tree shall also determine the navigation (tab) order of the shape-based objects: the shape-based object with the lowest z-order (the first shape in lexical order) shall be first in navigation order, with objects being navigated in ascending z-order.

[Example: Consider the following PresentationML slide with two shapes

```
<p:sld>
  <p:cSld>
    <p:spTree>
      ...
      <p:sp>
```

```
<p:nvSpPr>
  <p:cNvPr id="5" name="Oval 4" />
  ...
</p:nvSpPr>
...
</p:sp>
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="4" name="Isosceles Triangle 3" />
    ...
  </p:nvSpPr>
  ...
</p:sp>
</p:spTree>
</p:cSld>
...
</p:sld>
```

In the above example the shape with name `Oval 4` has the lowest z-order value since that shape is the first shape in the shape tree. `Oval 4` is also the first shape in navigation order. The shape with name `Isosceles Triangle 3` has the highest z positioning value since that shape is the last shape in the shape tree. `Isosceles Triangle 3` is also the last shape in navigation order. *end example*]

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GroupShape](#)) is located in §A.3. *end note*]

19.3.1.46 style (Shape Style)

This element specifies the style information for a shape. This is used to define a shape's appearance in terms of the preset styles defined by the style matrix for the theme.

[Example:

```
<p:style>
  <a:lnRef idx="3">
    <a:schemeClr val="lt1"/>
  </a:lnRef>
  <a:fillRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:fillRef>
  <a:effectRef idx="1">
    <a:schemeClr val="accent3"/>
  </a:effectRef>
  <a:fontRef idx="minor">
    <a:schemeClr val="lt1"/>
  </a:fontRef>
</p:style>
```

The parent shape of the above code is to have an outline that uses the third line style defined by the theme, use the first fill defined by the scheme, and be rendered with the first effect defined by the theme. Text inside the shape is to use the minor font defined by the theme.

end example]

| Parent Elements |
|---|
| cxnSp (§19.3.1.19); pic (§19.3.1.37); sp (§19.3.1.43) |

| Child Elements | Subclause |
|------------------------------|--------------|
| effectRef (Effect Reference) | §20.1.4.2.8 |
| fillRef (Fill Reference) | §20.1.4.2.10 |
| fontRef (Font Reference) | §20.1.4.1.17 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element’s content model (CT_ShapeStyle) is located in §A.4.1.
end note]

19.3.1.47 tags (Customer Data Tags)

This element specifies the existence of customer data in the form of tags. This allows for the storage of customer data within the PresentationML framework. While this is similar to the ext tag in that it can be used store information, this tag mainly focuses on referencing to other parts of the presentation document. This is accomplished via the relationship identification attribute that is required for all specified tags.

| Parent Elements |
|--------------------------|
| custDataLst (§19.3.1.18) |

| Attributes | Description |
|---|---|
| id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | This attribute specifies the relationship identifier for the customer data tag. This allows for a link to a resource that is external from the current XML document but still contained within the presentation document. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TagsData](#)) is located in §A.3. *end note*]

19.3.1.48 timing (Slide Timing Information for a Slide Layout)

This element specifies the timing information for handling all animations and timed events within the corresponding slide. This information is tracked via time nodes within the timing element. More information on the specifics of these time nodes and how they are to be defined can be found within the Animation section of the PresentationML framework.

| Parent Elements |
|--|
| sld (§19.3.1.38); sldLayout (§19.3.1.39); sldMaster (§19.3.1.42) |

| Child Elements | Subclause |
|--|------------|
| bldLst (Build List) | §19.5.14 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| tnLst (Time Node List) | §19.5.87 |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideTiming](#)) is located in §A.3. *end note*]

19.3.1.49 [titleStyle](#) (Slide Master Title Text Style)

This element specifies the text formatting style for the title text within a master slide. This formatting is used on all title text within related presentation slides. The text formatting is specified by utilizing the DrawingML framework just as within a regular presentation slide. Within a title style there can be many different style types defined as there are different kinds of text stored within a slide title.

| Parent Elements |

| checker (Checker Slide Transition) | §19.5.24 |

| Child Elements | Subclause |
|--|------------|
| circle (Circle Slide Transition) | §19.5.26 |
| comb (Comb Slide Transition) | §19.5.30 |
| cover (Cover Slide Transition) | §19.5.32 |
| cut (Cut Slide Transition) | §19.5.34 |
| diamond (Diamond Slide Transition) | §19.5.35 |
| dissolve (Dissolve Slide Transition) | §19.5.36 |
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| fade (Fade Slide Transition) | §19.5.41 |
| newsflash (Newsflash Slide Transition) | §19.5.50 |
| plus (Plus Slide Transition) | §19.5.54 |
| pull (Pull Slide Transition) | §19.5.58 |
| push (Push Slide Transition) | §19.5.59 |
| random (Random Slide Transition) | §19.5.60 |
| randomBar (Random Bar Slide Transition) | §19.5.61 |
| sndAc (Sound Action) | §19.5.69 |
| split (Split Slide Transition) | §19.5.71 |
| strips (Strips Slide Transition) | §19.5.74 |
| wedge (Wedge Slide Transition) | §19.5.94 |
| wheel (Wheel Slide Transition) | §19.5.95 |
| wipe (Wipe Slide Transition) | §19.5.96 |
| zoom (Zoom Slide Transition) | §19.5.97 |

| Attributes | Description |
|-----------------------------|--|
| advClick (Advance on Click) | <p>Specifies whether a mouse click advances the slide or not. If this attribute is not specified then a value of true is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| advTm (Advance after time) | <p>Specifies the time, in milliseconds, after which the transition should start. This setting can be used in conjunction with the advClick attribute. If this attribute is not specified then it is assumed that no auto-advance occurs.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| spd (Transition Speed) | <p>Specifies the transition speed that is to be used when transitioning from the current slide to the next.</p> |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_TransitionSpeed simple type (§19.7.54). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SlideTransition](#)) is located in §A.3. *end note*]

19.3.1.51 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

| Parent Elements |
|-----------------|
| sp (§19.3.1.43) |

| Child Elements | Subclause |
|-----------------------------|--------------|
| bodyPr (Body Properties) | §21.1.2.1.1 |
| lstStyle (Text List Styles) | §21.1.2.4.12 |
| p (Text Paragraphs) | §21.1.2.2.6 |

[Note: The W3C XML Schema definition of this element's content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

19.3.1.52 txStyles (Slide Master Text Styles)

This element specifies the text styles within a slide master. Within this element is the styling information for title text, the body text and other slide text as well. This element is only for use within the Slide Master and thus sets the text styles for the corresponding presentation slides.

[Example: Consider the case where we would like to specify the title text for a master slide.

```
<p:txStyles>
  <p:titleStyle>
    <a:lvl1pPr align="ctr" rtl="0" latinLnBrk="0">
      <a:spcBef>
        <a:spcPct val="0"/>
      </a:spcBef>
      <a:buNone/>
      <a:defRPr sz="4400" kern="1200">
        <a:solidFill>
```

```

        <a:schemeClr val="tx1"/>
    </a:solidFill>
    <a:latin typeface="+mj-lt"/>
    <a:ea typeface="+mj-ea"/>
    <a:cs typeface="+mj-cs"/>
</a:defRPr>
</a:lvl1pPr>
</p:titleStyle>
</p:txStyles>

```

In the above example the title text is set according to the above formatting for all related slides within the presentation. *end example*]

| Parent Elements |
|------------------------|
| sldMaster (§19.3.1.42) |

| Child Elements | Subclause |
|--|------------|
| bodyStyle (Slide Master Body Text Style) | §19.3.1.5 |
| extLst (Extension List) | §19.2.1.12 |
| otherStyle (Slide Master Other Text Style) | §19.3.1.35 |
| titleStyle (Slide Master Title Text Style) | §19.3.1.49 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_SlideMasterTextStyles](#)) is located in §A.3. *end note*]

19.3.1.53 xfrm (2D Transform for Graphic Frame)

This element specifies the transform to be applied to the corresponding graphic frame. This transformation is applied to the graphic frame just as it would be for a shape or group shape.

| Parent Elements |
|---------------------------|
| graphicFrame (§19.3.1.21) |

| Child Elements | Subclause |
|----------------|-----------|
| ext (Extents) | §20.1.7.3 |
| off (Offset) | §20.1.7.4 |

| Attributes | Description |
|--------------------|--|
| flipH (Horizontal) | Specifies a horizontal flip. When true, this attribute defines that the shape is flipped |

| Attributes | Description |
|--|---|
| Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p> <div data-bbox="414 388 1031 556"> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| flipV (Vertical Flip) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p> <div data-bbox="414 882 1031 1050"> </div> <p>end example]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rot (Rotation) Namespace: http://purl.oclc.org/ooxml/drawingml/main | <p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Transform2D](#)) is located in §A.4.1.
end note]

19.3.2 Embedded Objects

Within the slides portion of PresentationML, there are the embedded elements. These are objects that can be embedded within a slide. As we defined a slide to be a container it can be seen that it does not just contain shapes, pictures and text but embedded objects as well that are not necessarily native to the PresentationML platform.

19.3.2.1 control (Embedded Control)

This element specifies the existence of an embedded control in the slide.

| Parent Elements |
|-----------------------|
| controls (§19.3.1.15) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |
| pic (Picture) | §19.3.1.37 |

| Attributes | Description |
|---|--|
| id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| imgH (Image Height) | Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42). |
| imgW (Image Width) | Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42). |
| name (Embedded Object Name) | Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| showAsIcon (Show Embedded Object As Icon) | Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Control](#)) is located in §A.3. *end note*]

19.3.2.2 [embed \(Embedded Object or Control\)](#)

This element specifies an Embedded object or Control that is embedded within the presentation.

| Parent Elements |
|--------------------|
| oleObj (§19.3.2.4) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|--|--|
| followColorScheme (Color Scheme Properties for Embedded object) | Specifies the Color Scheme Properties for the corresponding Embedded object being specified. The possible values for this attribute are defined by the ST_OleObjectFollowColorScheme simple type (§19.7.6). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OleObjectEmbed](#)) is located in §A.3. *end note*]

19.3.2.3 [link \(Linked Object or Control\)](#)

This element specifies a link to an external Embedded object or Control.

| Parent Elements |
|--------------------|
| oleObj (§19.3.2.4) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|---|--|
| updateAutomatic (Update Linked Embedded Objects Automatically) | This attribute determines if linked embedded objects are automatically updated when the presentation is opened or printed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OleObjectLink](#)) is located in §A.3. *end note*]

19.3.2.4 oleObj (Global Element for Embedded objects and Controls)

This element specifies a global element to be used for an Embedded object and Control.

When the oleObject element contains a pic child element, the identifier specified by the pic/nvPicPr/cNvPr@id attribute shall be ignored and the identifier specified by the graphicFrame/nvGraphicFramePr/cNvPr@id attribute shall be used when deciding which identifier to use for the OLE object.

| Child Elements | Subclause |
|------------------------------------|------------|
| embed (Embedded Object or Control) | §19.3.2.2 |
| link (Linked Object or Control) | §19.3.2.3 |
| pic (Picture) | §19.3.1.37 |

| Attributes | Description |
|---|--|
| id (Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the relationship id that is used to identify this Embedded object from within a slide. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| imgH (Image Height) | Specifies the height of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42). |
| imgW (Image Width) | Specifies the width of the embedded control. The possible values for this attribute are defined by the ST_PositiveCoordinate32 simple type (§20.1.10.42). |
| name (Embedded Object Name) | Specifies the identifying name class used by scripting languages. This name is also used to construct the clipboard name. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| progId (Embedded Object ProgID) | Specifies the progid for an Embedded object. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| showAsIcon (Show Embedded Object As Icon) | Specifies whether the Embedded object shows as an icon or using its native representation. The possible values for this attribute are defined by the W3C XML Schema boolean |

| Attributes | Description |
|------------|-------------|
| | datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OleObject](#)) is located in §A.3. *end note*]

19.3.3 Programmable Tags

Within the slides portion of PresentationML there are the tag elements. These are extensibility names and values that assist in the storage of legacy variables from older file formats.

19.3.3.1 tag (Programmable Extensibility Tag)

This element specifies a programmable extensibility tag to be used for storage of legacy variables.

| Parent Elements |
|--------------------|
| tagLst (§19.3.3.2) |

| Attributes | Description |
|-------------|--|
| name (Name) | Specifies the name associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| val (Value) | Specifies the value associated with this specific programmable tag. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_StringTag](#)) is located in §A.3. *end note*]

19.3.3.2 tagLst (Programmable Tab List)

This element specifies the list of programmable extensibility tags that are used to store variables from legacy file formats.

| Parent Elements |
|---|
| Root element of PresentationML User-Defined Tags part |

| Child Elements | Subclause |
|--------------------------------------|-----------|
| tag (Programmable Extensibility Tag) | §19.3.3.1 |

[Note: The W3C XML Schema definition of this element's content model ([CT TagList](#)) is located in §A.3. *end note*]

19.4 Comments

A comment is a text note attached to a slide, with the primary purpose of allowing readers of a presentation to provide feedback to the presentation author. Each comment contains an unformatted text string and information about its author, and is attached to a particular location on a slide. Comments can be visible while editing the presentation, but do not appear when a slide show is given. The displaying application decides when to display comments and determines their visual appearance.

19.4.1 cm (Comment)

This element specifies a single comment attached to a slide. It contains the text of the comment, its position on the slide, and attributes referring to its author and date.

[Example:

```
<p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
  <p:pos x="10" y="10"/>
  <p:text>Add diagram to clarify.</p:text>
</p:cm>
```

end example]

| Parent Elements |
|-----------------|
| cmLst (§19.4.4) |

| Child Elements | Subclause |
|--|------------|
| extLst (Extension List with Modification Flag) | §19.3.1.20 |
| pos (Comment Position) | §19.4.5 |
| text (Comment's Text Content) | §19.4.6 |

| Attributes | Description |
|------------------------------|---|
| authorId (Comment Author ID) | This attribute specifies the author of the comment. It refers to the ID of an author in the comment author list for the document. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| dt (Comment Date/Time) | This attribute specifies the date and time this comment was last modified. |

| Attributes | Description |
|---------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema dateTime datatype. |
| idx (Comment Index) | <p>This attribute specifies an identifier for this comment that is unique within a list of all comments by this author in this document. An author's first comment in a document has index 1.</p> <p>[<i>Note</i>: Because the index is unique only for the comment author, a document can contain multiple comments with the same index created by different authors. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_Index simple type (§19.7.3).</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Comment](#)) is located in §A.3. *end note*]

19.4.2 cmAuthor (Comment Author)

This element specifies a single author with comments in the document. It contains a unique author ID, the author's name and initials, the index of the author's last comment, and the index of a color associated with the author.

[*Example*:

```
<p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

end example]

| Parent Elements |
|-----------------------|
| cmAuthorLst (§19.4.3) |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|-------------------------------------|---|
| clrIdx (Comment Author Color Index) | <p>This attribute specifies an index into the generating application's comments color table to allow for visual (color) differentiation of different author's comments. This color is used for all comments by this author. If more authors exist than there are entries in the color table, the color index wraps around to the beginning of the table.</p> <p>[<i>Note</i>: It is left entirely up to the generating application to determine the amount of colors used in the comments color table and in what order these are used when rendering comments on a slide surface. <i>end note</i>]</p> |

| Attributes | Description |
|--|--|
| | The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| id (Comment Author ID) | <p>This attribute specifies a unique (within the document) zero-based identifier that refers to a single comment author.</p> <p>[<i>Note:</i> The method of generating an author id is determined by the application and need not be sequential, provided each id is unique within the list of comment authors for the document. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| initials (Comment Author Initials) | <p>This attribute specifies a string that represents the initials of this particular author. The value is not necessarily unique. It is intended for use by the application as an abbreviated version of the comment author's name.</p> <p>The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).</p> |
| lastIdx (Index of Comment Author's last comment) | <p>Index of the last comment added to this document by this author. New comments by this author are counted starting with the value one greater than this index.</p> <p>[<i>Note:</i> The index of a deleted comment is not reused; therefore, this value is not an accurate count of the total number of comments by the author. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| name (Comment Author Name) | <p>This attribute specifies the full name of this particular author. As a string, it has no security or authentication data. This value is not guaranteed to be unique across all document authors.</p> <p>The possible values for this attribute are defined by the ST_Name simple type (§19.7.5).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CommentAuthor](#)) is located in §A.3. *end note*]

19.4.3 cmAuthorLst (List of Comment Authors)

This element specifies a list of authors with comments in the current document. Each comment in a document shall refer to an author in this list. To determine if a new author is in this list, the author's name and initials shall both match; otherwise, the new author is considered unique and a separate cmAuthor element is added.

[*Example:* A document contains comments left by two authors.

```
<p:cmAuthorLst>
  <p:cmAuthor id="0" name="Julie Lee" initials="JL" lastIdx="1" clrIdx="0"/>
```

```
<p:cmAuthor id="1" name="Fred Jones" initials="FJ" lastIdx="2" clrIdx="1"/>
</p:cmAuthorLst>
```

end example]

| Parent Elements |
|---|
| Root element of PresentationML Comment Authors part |

| Child Elements | Subclause |
|---------------------------|-----------|
| cmAuthor (Comment Author) | §19.4.2 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CommentAuthorList](#)) is located in §A.3. *end note*]

19.4.4 cmLst (Comment List)

This element specifies a list of comments for a particular slide.

[*Example:* A slide contains two comments, each left by a different author. This example demonstrates that two comments can have the same index if they are created by different authors.

```
<p:cmLst>
  <p:cm authorId="0" dt="2006-08-28T17:26:44.129" idx="1">
    <p:pos x="10" y="10"/>
    <p:text>Add diagram to clarify.</p:text>
  </p:cm>
  <p:cm authorId="1" dt="2006-08-28T17:44:19.679" idx="1">
    <p:pos x="1426" y="660"/>
    <p:text>Clean up this text.</p:text>
  </p:cm>
</p:cmLst>
```

end example]

| Parent Elements |
|--|
| Root element of PresentationML Comments part |

| Child Elements | Subclause |
|----------------|-----------|
| cm (Comment) | §19.4.1 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_CommentList](#)) is located in §A.3.
end note]

19.4.5 pos (Comment Position)

This element specifies the positioning information for the placement of a comment on a slide surface. In LTR versions of the generating application, this position information should refer to the upper left point of the comment shape. In RTL versions of the generating application, this position information should refer to the upper right point of the comment shape.

[*Note:* The anchoring point on the slide surface is unaffected by a right-to-left or left-to-right layout change. That is the anchoring point remains the same for all language versions. *end note*]

[*Note:* Because there is no specified size or formatting for comments, this UI widget used to display a comment can be any size and thus the lower right point of the comment shape is determined by how the viewing application chooses to display comments. *end note*]

[*Example:*

```
<p:pos x="1426" y="660"/>
```

end example]

| Parent Elements |
|-----------------|
| cm (§19.4.1) |

| Attributes | Description |
|--|---|
| x (X-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object: <... x="0" y="100" /> The x attribute defines an x-coordinate of 0. <i>end example</i>] The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| y (Y-Axis Coordinate) Namespace: http://purl.oclc.org/ooxml/drawing | Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element. [<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object: |

| Attributes | Description |
|------------|---|
| ml/main | <code><... x="0" y="100" /></code> The y attribute defines a y-coordinate of 100. <i>end example</i> The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

19.4.6 text (Comment's Text Content)

This element specifies the content of a comment. This is the text with which the author has annotated the slide.

[Example:

```
<p:text>Add diagram to clarify.</p:text>
```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

| Parent Elements |
|-----------------|
| cm (§19.4.1) |

19.5 Animation

The Animation section of the PresentationML framework stores the movement and related information of objects.

This schema is loosely based on the syntax and concepts from the Synchronized Multimedia Integration Language (SMIL), a W3C Recommendation for describing multimedia presentations using XML.

The schema describes all the animations effects that reside on a slide and also the animation that occurs when going from slide to slide (slide transition).

Animations on a slide are inherently time-based and consist of an animation effects on an object or text. Slide transitions however do not follow this concept and always appear before any animation on a slide.

All elements described in this schema are contained within the slide XML file. More specifically they are in the `<transition>` and the `<timing>` element as shown below:

```
<p:sld>
  <p:cSld> ... </p:cSld>
  <p:clrMapOvr> ... </p:clrMapOvr>
  <p:transition> ... </p:transition>
```

```
<p:timing> ... </p:timing>
</p:sld>
```

19.5.1 anim (Animate)

This element is a generic animation element that requires little or no semantic understanding of the attribute being animated. It can animate text within a shape or even the shape itself.

[*Example:* Consider trying to emphasize text within a shape by changing the size of its font by 150%. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1">
        <p:txEl>
          <p:charRg st="1" end="4"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| cBhvr (Common Behavior) | §19.5.22 |
| tavLst (Time Animated Value List) | §19.5.80 |

| Attributes | Description |
|------------|---|
| by (By) | This attribute specifies a relative offset value for the animation with respect to its position before the start of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

| Attributes | Description |
|--------------------------------|--|
| calcmode (Calculation Mode) | This attribute specifies the interpolation mode for the animation. The possible values for this attribute are defined by the ST_TLAnimateBehaviorCalcMode simple type (§19.7.20). |
| from (From) | This attribute specifies the starting value of the animation. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| to (To) | This attribute specifies the ending value for the animation as a percentage. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| valueType (Value Type) | This attribute specifies the type of property value. The possible values for this attribute are defined by the ST_TLAnimateBehaviorValueType simple type (§19.7.21). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimateBehavior](#)) is located in §A.3. *end note*]

19.5.2 animClr (Animate Color Behavior)

This animation element is responsible for animating the color of an object.

[Example: Consider trying to emphasize a shape by changing its fill color to scheme color accent2. The <animClr> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-------------------------|-----------|
| by (By) | §19.5.20 |
| cBhvr (Common Behavior) | §19.5.22 |
| from (From) | §19.5.43 |
| to (To) | §19.5.90 |

| Attributes | Description |
|----------------------|---|
| clrSpc (Color Space) | <p>This attribute specifies the color space in which to interpolate the animation. Values for example can be HSL & RGB.</p> <p>The values for from/to/by/etc. can still be specified in any supported color format without affecting the color space within which the animation happens.</p> <p>The RGB color space is best used for doing animations between two different colors since it doesn't require going through any other hues between the two colors specified. The HSL space is useful for animating through a rainbow of colors or for modifying just the saturation by 30% for example.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateColorSpace simple type (§19.7.23).</p> |
| dir (Direction) | <p>This attribute specifies which direction to cycle the hue around the color wheel. Values are clockwise or counter clockwise. Default is clockwise.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateColorDirection simple type (§19.7.22).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimateColorBehavior](#)) is located in §A.3. *end note*]

19.5.3 animEffect (Animate Effect)

This animation behavior provides the ability to do image transform/filter effects on elements. Some visual effects are dynamic in nature and have a progress that animates from 0 to 1 over a period of time to do visual transitions between hidden and visible states. Other filters are static and apply a effects like a blur or drop-shadow which aren't inherently time-based.

[Example: Consider trying to emphasize a shape by creating an entrance animation using a "blinds" motion.

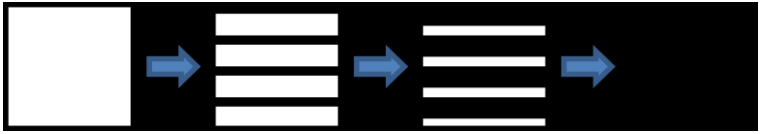

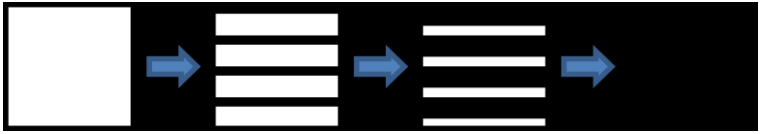

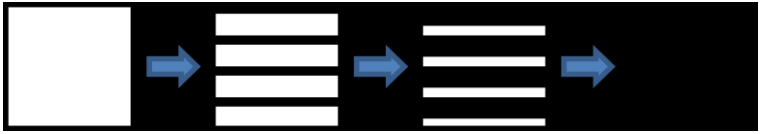

```
<p:animEffect transition="in" filter="blinds(horizontal)">
```

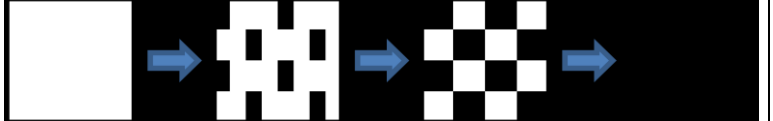

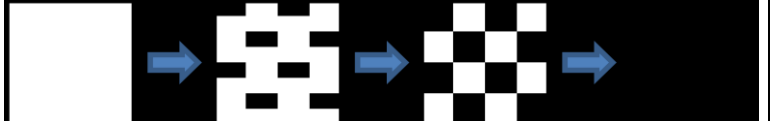

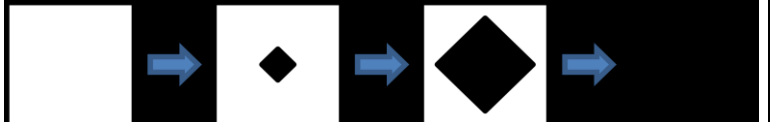

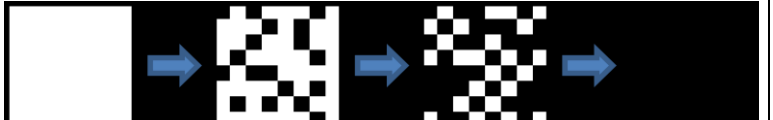

```
<p:cBhvr>
  <p:cTn id="7" dur="500"/>
  <p:tgtEl>
    <p:spTgt spid="4"/>
  </p:tgtEl>
</p:cBhvr>
</p:animEffect>
```

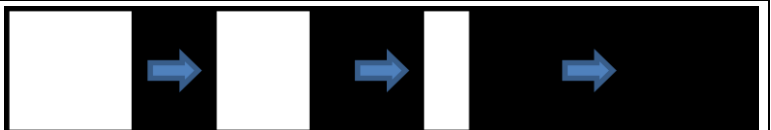

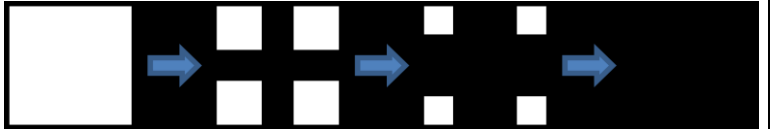

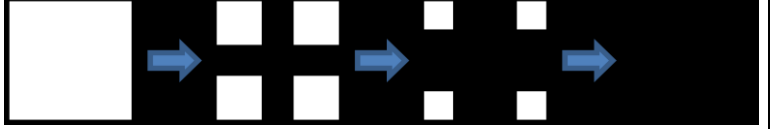

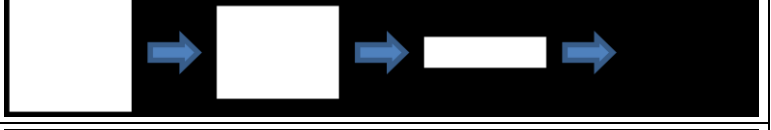

end example]

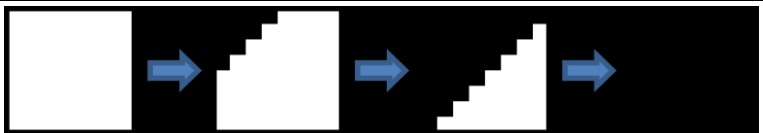

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-------------------------|-----------|
| cBhvr (Common Behavior) | §19.5.22 |
| progress (Progress) | §19.5.57 |

| Attributes | Description | | | | | | |
|--------------------|---|-------|-------------|--------------------|--|------------------|--|
| filter (Filter) | <p>This attribute specifies the animation types and subtypes to be used for the effect. Multiple animations are allowed to be listed so that in the event that a superseding animation (leftmost) cannot be rendered, a fallback animation is available. That is, the rendering application parses the list from left to right until a supported animation is found.</p> <p>The syntax used for the filter attribute value is as follows: "type(subtype);type(subtype)". Subtype can be a string value such as "fromLeft" or a numerical value depending on the type specified.</p> <p>Reserved Animation Types(subtypes):</p> <table><tr><th>Value</th><th>Description</th></tr><tr><td>blinds(horizontal)</td><td></td></tr><tr><td>blinds(vertical)</td><td></td></tr></table> | Value | Description | blinds(horizontal) |  | blinds(vertical) |  |
| Value | Description | | | | | | |
| blinds(horizontal) |  | | | | | | |
| blinds(vertical) |  | | | | | | |

| Attributes | Description | |
|------------|----------------------|--|
| | box(in) |  |
| | box(out) |  |
| | checkerboard(across) |  |
| | checkerboard(down) |  |
| | circle |  |
| | diamond |  |
| | dissolve |  |
| | fade |  |
| | slide(fromTop) |  |
| | slide(fromBottom) |  |
| | slide(fromLeft) |  |

| Attributes | Description | |
|------------|------------------------|--|
| | slide(fromRight) |  |
| | plus(in) |  |
| | plus(out) |  |
| | barn(inVertical) |  |
| | barn(inHorizontal) |  |
| | barn(outVertical) |  |
| | barn(outHorizontal) |  |
| | randomBars(horizontal) |  |
| | randomBars(vertical) |  |
| | strips(downLeft) |  |
| | strips(upLeft) |  |

| Attributes | Description |
|-------------------|--|
| strips(downRight) |  |
| strips(upRight) |  |
| wedge |  |
| wheel(1) |  |
| wheel(2) |  |
| wheel(3) |  |
| wheel(4) |  |
| wheel(8) |  |
| wipe(right) |  |
| wipe(left) |  |
| wipe(down) |  |

| Attributes | Description |
|-----------------------|--|
| | <div data-bbox="418 247 1477 388"> <div>wipe(up)</div>  </div> <p>[Note: The renderings shown above are for example purposes only. Exact rendering of any animation is determined by the rendering application. As such, the same animation can have many variations, depending on the implementation. More detail for each rendering above can be found in transition (§19.3.1.50). <i>end note</i>]</p> <p>[Example: Consider the following animation effect:</p> <pre> <p:animEffect transition="in" filter="blinds(horizontal);blinds(vertical)"> <p:cBhvr> <p:cTn id="7" dur="500"/> <p:tgtEl> <p:spTgtspid="5"/> </p:tgtEl> </p:cBhvr> </p:animEffect> </pre> <p>There are two animation filters shown in this example. The first is the blinds (horizontal), which the rendering application is to use as the primary animation effect. If, however, the rendering application does not support this animation, the blinds (vertical) animation is used. In this example there are only two animation filters listed, a primary and a fallback, but it is possible to list multiple fallback filters using the syntax defined above.</p> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| prLst (Property List) | <p>This attribute specifies a list of properties that coincide with the effect specified. Although there are many animation types allowed, this attribute allows the setting of specific property settings in order to describe an even wider variety of animation types.</p> <p>The syntax used for the prLst attribute value is as follows: “name:value;name:value”. When multiple animation types are listed in the filter attribute, the rendering application attempts to apply each property value even though some might not apply to it.</p> <p>Reserved Names(values):</p> <ul style="list-style-type: none"> • opacity (float values of 0.0 - 1.0) <p>[Example: Consider the following animation effect:</p> |

| Attributes | Description |
|----------------------------|---|
| | <pre><p:animEffect filter="image" prLst="opacity: 0.5"> <p:cBhvr rctx="IE"> <p:cTn id="7" dur="indefinite"/> <p:tgtEl> <p:spTgtspid="3"/> </p:tgtEl> </p:cBhvr> </p:animEffect></pre> <p>The animation filter specified is an image filter type that has a specific property called opacity set to a value of 0.5. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| transition (Transition) | <p>This attribute specifies whether to transition the element in or out or treat it as a static filter. The values are "none", "in" and "out", and the default value is "in".</p> <p>When a value of "in" is specified, the element is not visible at the start of the animation and is completely visible be the end of the duration. When "out" is specified, the element is visible at the start and not visible at the end of the effect. This visibility is in addition to the effect of setting CSS visibility or display attributes.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateEffectTransition simple type (§19.7.24).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLAnimateEffectBehavior](#)) is located in §A.3. *end note*]

19.5.4 animMotion (Animate Motion)

Animate motion provides an abstracted way to move positioned elements. It provides the ability to specify from/to/by motion as well as to use more detailed path descriptions for motion over polylines or bezier curves.

[Example: Consider animating a shape from its original position to the right.. The <animMotion> element should be used as follows:

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0 E" pathEditMode="relative">
  <p:cBhvr>
    <p:cTn id="1" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="1"/>
    </p:tgtEl>
  <p:attrNameLst>
```

```

    <p:attrName>ppt_x</p:attrName>
    <p:attrName>ppt_y</p:attrName>
  </p:attrNameLst>
</p:cBhvr>
</p:animMotion>

```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-------------------------|-----------|
| by (By) | §19.5.21 |
| cBhvr (Common Behavior) | §19.5.22 |
| from (From) | §19.5.44 |
| rCtr (Rotation Center) | §19.5.62 |
| to (To) | §19.5.88 |

| Attributes | Description |
|-------------------------------|--|
| origin (Origin) | <p>Specifies what the origin of the motion path is relative to such as the layout of the slide, or the parent.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateMotionBehaviorOrigin simple type (§19.7.25).</p> |
| path (Path) | <p>Specifies the path primitive followed by coordinates for the animation motion. The allowed values that are understood within a path are as follows:</p> <p>M = move to, L = line to, C = curve to, Z=close loop, E=end UPPERCASE = absolute coords, lowercase = relative coords Thus total allowed set = {M,L,C,Z,E,m,l,c,z,e}</p> <p>[Example: The following string is a sample path. path: "M 0 0 L 1 1 c 1 2 3 4 4 4 Z" <i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| pathEditMode (Path Edit Mode) | <p>This attribute specifies how the motion path moves when the target element is moved.</p> <p>The possible values for this attribute are defined by the ST_TLAnimateMotionPathEditMode simple type (§19.7.26).</p> |

| Attributes | Description |
|-------------------------|--|
| ptsTypes (Points Types) | <p>This attribute describes the point type of the points in the path attribute. The allowed values that are understood for the ptsTypes attribute are as follows:</p> <p>A = Auto, F = Corner, T = Straight, S = Smooth UPPERCASE = Straight Line follows point, lowercase = curve follows point. Thus, the total allowed set = {A,F,T,S,a,f,t,s}</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| rAng (Relative Angle) | <p>The attribute describes the relative angle of the motion path.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimateMotionBehavior](#)) is located in §A.3. *end note*]

19.5.5 animRot (Animate Rotation)

This animation element is responsible for animating the rotation of an object. Rotation values set in the "by" , "to, and "from" attributes are specified in degrees measured to a 60,000th, i.e 1 degree is 60,000. Rotation values can be larger than 360°.

The sign of the rotation angle specifies the direction for rotation. A negative rotation specifies that the rotation should appear in the host to go counter-clockwise".

[Example: Consider trying to emphasize a shape by rotating it 360 degrees clockwise. The <animRot> element should be used as follows:

```
<p:animRot by="21600000">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="5"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>r</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animRot>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-------------------------|-----------|
| cBhvr (Common Behavior) | §19.5.22 |

| Attributes | Description |
|-------------|---|
| by (By) | This attribute describes the relative offset value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3). |
| from (From) | This attribute describes the starting value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3). |
| to (To) | This attribute describes the ending value for the animation. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimateRotationBehavior](#)) is located in §A.3. *end note*]

19.5.6 animScale (Animate Scale)

This animation element is responsible for animating the scale of an object. When animating the scale, the element shall scale around the reference point of the element and the positioning system used should be consistent with the one used for motion paths. When animating the width and height of an element, all of the width/height animation values are calculated first then the scale animations are applied on top of that. So for example, an animation from 0 to 100 of the width with a concurrent scale from 100% to 200% would result in the element appearing to scale from 0 to 200.

[*Example:* Consider trying to emphasize a shape by scaling it larger by 150%. The <animScale> element should be used as follows:

```
<p:childTnLst>
  <p:animScale>
    <p:cBhvr>
      <p:cTn id="6" dur="2000" fill="hold"/>
      <p:tgtEl>
        <p:spTgt spid="5"/>
```

```

    </p:tgtEl>
  </p:cBhvr>
  <p:by x="150000" y="150000"/>
</p:animScale>
</p:childTnLst>

```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-------------------------|-----------|
| by (By) | §19.5.21 |
| cBhvr (Common Behavior) | §19.5.22 |
| from (From) | §19.5.44 |
| to (To) | §19.5.88 |

| Attributes | Description |
|--------------------------------|---|
| zoomContents (Zoom Content) | <p>This attribute specifies whether to zoom the contents of an object when doing a scaling animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TLAnimateScaleBehavior](#)) is located in §A.3. *end note*]

19.5.7 attrName (Attribute Name)

This element is used to contain an attribute value for an Attribute Name List. This value defines the specific attribute that an animation should be applied to, such as fill, style, and shadow, etc. A specific property is defined by using a "property.sub-property" format which is often extended to multiple sub properties as seen in the allowed values below.

Allowed property values:

style.opacity, style.rotation, style.visibility, style.color, style.fontSize,
 style.fontWeight, style.fontStyle, style.fontFamily, style.textEffectEmboss,
 style.textShadow, style.textTransform, style.textDecorationUnderline,
 style.textEffectOutline, style.textDecorationLineThrough, style.sRotation,
 imageData.cropTop, imageData.cropBottom, imageData.cropLeft,
 imageData.cropRight, imageData.cropRight, imageData.gain, imageData.blacklevel,
 imageData.gamma, imageData.grayscale, imageData.chromakey, fill.on, fill.type,
 fill.color, fill.opacity, fill.color2, fill.method, fill.opacity2, fill.angle,
 fill.focus, fill.focusposition.x, fill.focusposition.y, fill.focussize.x,
 fill.focussize.y, stroke.on, stroke.color, stroke.weight, stroke.opacity,
 stroke.linestyle, stroke.dashstyle, stroke.filltype, stroke.src, stroke.color2,
 stroke.imagesize.x, stroke.imagesize.y, stroke.startArrow, stroke.endArrow,
 stroke.startArrowWidth, stroke.startArrowLength, stroke.endArrowWidth,
 stroke.endArrowLength, shadow.on, shadow.type, shadow.color, shadow.color2,
 shadow.opacity, shadow.offset.x, shadow.offset.y, shadow.offset2.x,
 shadow.offset2.y, shadow.origin.x, shadow.origin.y, shadow.matrix.xtox,
 shadow.matrix.ytox, shadow.matrix.xtoy, shadow.matrix.ytoy,
 shadow.matrix.perspectiveX, shadow.matrix.perspectiveY, skew.on, skew.offset.x,
 skew.offset.y, skew.origin.x, skew.origin.y, skew.matrix.xtox, skew.matrix.ytox,
 skew.matrix.xtoy, skew.matrix.ytoy, skew.matrix.perspectiveX,
 skew.matrix.perspectiveY, extrusion.on, extrusion.type, extrusion.render,
 extrusion.viewpointorigin.x, extrusion.viewpointorigin.y, extrusion.viewpoint.x,
 extrusion.viewpoint.y, extrusion.viewpoint.z, extrusion.plane,
 extrusion.skewangle, extrusion.skewamt, extrusion.backdepth,
 extrusion.foredepth, extrusion.orientation.x, extrusion.orientation.y,
 extrusion.orientation.z, extrusion.orientationangle, extrusion.color,
 extrusion.rotationangle.x, extrusion.rotationangle.y,
 extrusion.lockrotationcenter, extrusion.autorotationcenter,
 extrusion.rotationcenter.x, extrusion.rotationcenter.y,
 extrusion.rotationcenter.z, and extrusion.colormode.

[Example: Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```

<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:anim>

```

```
<p:attrNameLst>
  <p:attrName>style.fontSize</p:attrName>
</p:attrNameLst>
</p:cBhvr>
</p:anim>
```

end example]

The possible values for this element are defined by the W3C XML Schema string datatype.

| Parent Elements |
|-----------------------|
| attrNameLst (§19.5.8) |

19.5.8 attrNameLst (Attribute Name List)

This element is used to describe a list of attributes in which to apply an animation to.

[*Example:* Consider trying to emphasize the txt font size within the body of a shape. The attribute would be 'style.fontSize' and this can be done by doing the following:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

| Parent Elements |
|------------------|
| cBhvr (§19.5.22) |

| Child Elements | Subclause |
|---------------------------|-----------|
| attrName (Attribute Name) | §19.5.7 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLBehaviorAttributeNameList](#)) is located in §A.3. *end note*]

19.5.9 audio (Audio)

This element is used to include audio during an animation. This element specifies that this node within the animation tree triggers the playback of an audio file; the actual audio file used is specified by the `sndTgt` element (§19.5.70).

[*Example:* Consider adding applause sound to an animation sequence. The audio element is used as follows:

```
<p:cTn ...>
  <p:stCondLst>...</p:stCondLst>
  <p:childTnLst>...</p:childTnLst>
  <p:subTnLst>
    <p:audio>
      <p:cMediaNode vol="50%">...
        <p:tgtEl>
          <p:sndTgt r:embed="rId2" />
        </p:tgtEl>
      </p:cMediaNode>
    </p:audio>
  </p:subTnLst>
</p:cTn>
```

The audio element specifies the location of the audio playback within the animation; its child `sndTgt` element specifies that the audio to be played is the target of the relationship with ID `rId2`.

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|---|-----------|
| cMediaNode (Common Media Node Properties) | §19.5.29 |

| Attributes | Description |
|----------------------------|---|
| isNarration (Is Narration) | <p>This attribute indicates whether the audio is a narration for the slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLMediaNodeAudio](#)) is located in §A.3. *end note*]

19.5.10 **bg (Background)**

This element is used to specify animating the background of an object.

[*Example:* Consider adding animation to the background of Shape Id 3. The <bg> tag can be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="3">
    <p:bg/>
  </p:spTgt>
</p:tgtEl>
```

end example]

| Parent Elements |
|------------------|
| spTgt (§19.5.72) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.11 **bldAsOne (Build As One)**

This element specifies in the build list to build the entire graphical object as one entity.

[*Example:* Consider having a graph appear as on entity as opposed to by category. The <bldAsOne> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldAsOne/>
  </p:bldGraphic>
</p:bldLst>
```

end example]

| Parent Elements |
|-----------------------|
| bldGraphic (§19.5.13) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.12 **bldDgm (Build Diagram)**

This element specifies how to build the animation for a diagram.

[*Example:* Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the `bldChart` element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldLst (§19.5.14) |

| Attributes | Description |
|---------------------------|--|
| bld (Diagram Build Types) | <p>This attribute describes how the diagram is built. The animation animates the sub-elements in the container in the particular order defined by this attribute.</p> <p>The possible values for this attribute are defined by the <code>ST_TLDiagramBuildType</code> simple type (§19.7.33).</p> |
| grpId (Group ID) | <p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>unsignedInt</code> datatype.</p> |
| spid (Shape ID) | <p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the <code>ST_ShapeID</code> simple type (§20.1.10.54).</p> |
| uiExpand (Expand UI) | <p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema <code>boolean</code> datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLBuildDiagram](#)) is located in §A.3.
end note]

19.5.13 bldGraphic (Build Graphics)

This element specifies how to build a graphical element.

[*Example:* Consider having a chart graphical element appear as a whole as opposed to by a category. The <bldGraphic> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="3" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldLst (§19.5.14) |

| Child Elements | Subclause |
|-----------------------------|-----------|
| bldAsOne (Build As One) | §19.5.11 |
| bldSub (Build Sub Elements) | §19.5.17 |

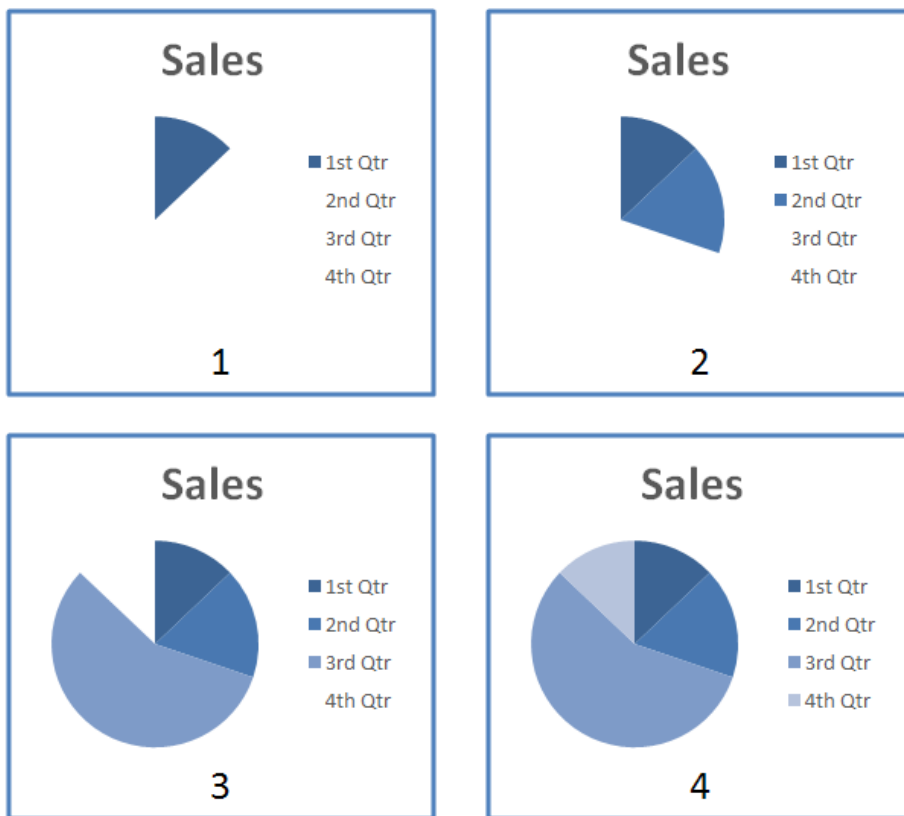

| Attributes | Description |
|----------------------|---|
| grpId (Group ID) | <p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| spid (Shape ID) | <p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).</p> |
| uiExpand (Expand UI) | <p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLGraphicalObjectBuild](#)) is located in §A.3. *end note*]

19.5.14 bldLst (Build List)

This element specifies the list of graphic elements to build. This refers to how the different sub-shapes or sub-components of a object are displayed. The different objects that can have build properties are text, diagrams, and charts.

[Example: Consider animating a pie chart but based on category as shown below:

The <bldList> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="1" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

| Parent Elements |
|---------------------|
| timing (§19.3.1.48) |

| Child Elements | Subclause |
|------------------------------------|-----------|
| bldDgm (Build Diagram) | §19.5.12 |

| bldOleChart (Build Embedded Chart) | §19.5.15 |
| bldP (Build Paragraph) | §19.5.16 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BuildList](#)) is located in §A.3. *end note*]

19.5.15 bldOleChart (Build Embedded Chart)

This element describes animation an a embedded Chart.

[*Example:* Consider displaying animation on a embedded graphical chart. The <bldOleChart>element should be use as follows:

```
<p:bldLst>
  <p:bldOleChart spid="1025" grpId="0"/>
</p:bldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldLst (§19.5.14) |

| Attributes | Description |
|-----------------------------|--|
| animBg (Animate Background) | This attribute describes whether to animate the background of the shape. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| bld (Build) | This attribute describes how the diagram is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_TLOleChartBuildType simple type (§19.7.35). |
| grpId (Group ID) | This attribute ties effects persisted in the animation to the build information. The |

| Attributes | Description |
|----------------------|--|
| | <p>attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| spid (Shape ID) | <p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).</p> |
| uiExpand (Expand UI) | <p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLOleBuildChart](#)) is located in §A.3.
end note]

19.5.16 bldP (Build Paragraph)

This element specifies how to build paragraph level properties.

[Example: Consider having animation applied only to 1st level paragraphs. The <bldP> element should be used as follows:

```
<p:bldLst>
  <p:bldP spid="3" grpId="0" build="p"/>
</p:bldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldLst (§19.5.14) |

| Child Elements | Subclause |
|----------------------------|-----------|
| tmplLst (Template effects) | §19.5.85 |

| Attributes | Description |
|-----------------------------|--|
| advAuto (Auto Advance Time) | This attribute specifies time after which to automatically advance the build to the next step. |

| Attributes | Description |
|---|---|
| | The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38). |
| animBg (Animate Background) | <p>This attribute indicates whether to animate the background of the shape associated with the text.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| autoUpdateAnimBg (Auto Update Animation Background) | <p>This attribute indicates whether to automatically update the "animateBg" setting to true when the shape associated with the text has a fill or line.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| bldLvl (Build Level) | <p>This attribute describes the build level for the paragraph. It is only supported in paragraph type builds i.e the build attribute shall also be set to "byParagraph" for this attribute to apply.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| build (Build Types) | <p>This attribute describe the build types.</p> <p>The possible values for this attribute are defined by the ST_TLParaBuildType simple type (§19.7.36).</p> |
| grpId (Group ID) | <p>This attribute ties effects persisted in the animation to the build information. The attribute is used by the editor when changes to the build information are made. GroupIDs are unique for a given shape. They are not guaranteed to be unique IDs across all shapes on a slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| rev (Reverse) | <p>This attribute is only supported in paragraph type builds. This specifies the direction of the build relative to the order of the elements in the container. When this is set to "true", the animations for the paragraphs are persisted in reverse order to the order of the paragraphs themselves such that the last paragraph animates first. Default value is "false".</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| spid (Shape ID) | <p>This attribute describes the shape to which the build applies.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).</p> |

| Attributes | Description |
|----------------------|---|
| uiExpand (Expand UI) | <p>This attribute describes the view option indicating if the build should be displayed expanded.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLBuildParagraph](#)) is located in §A.3. *end note*]

19.5.17 bldSub (Build Sub Elements)

This element specifies the animation properties of a graphical object's sub-elements.

[*Example:* Consider applying animation to a graphical element consisting of a diagram. The <bldSub> element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="5" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

| Parent Elements |
|-----------------------|
| bldGraphic (§19.5.13) |

| Child Elements | Subclause |
|------------------------|-------------|
| bldChart (Build Chart) | §20.1.2.2.1 |
| bldDgm (Build Diagram) | §20.1.2.2.2 |

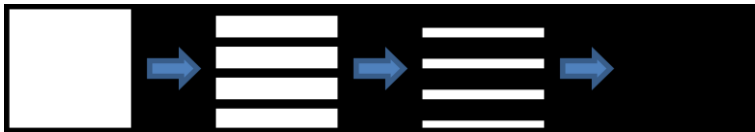

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AnimationGraphicalObjectBuildProperties](#)) is located in §A.4.1. *end note*]

19.5.18 blinds (Blinds Slide Transition)

This element describes the blinds slide transition effect, which uses a set of horizontal or vertical bars and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[*Example:* Consider the following cases in which the “blinds” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:blinds dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:blinds dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|----------------------------|--|
| dir (Transition Direction) | This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note]*

19.5.19 boolVal (Boolean Variant)

This element specifies a boolean value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

| Parent Elements |
|--|
| progress (§19.5.57); to (§19.5.89); val (§19.5.92) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>This attribute specifies the boolean value that this element contains and that should be used in evaluating this element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantBooleanVal](#)) is located in §A.3. *end note*]

19.5.20 by (By)

This element describes the relative offset value for the color animation.

[Example: Consider a shape with a lightening emphasis animation applied to it. The <by> element should be used as follows:

```
<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:hsl h="0" s="0" l="0"/>
  </p:by>
</p:animClr>
```

end example]

| Parent Elements |
|-------------------|
| animClr (§19.5.2) |

| Child Elements | Subclause |
|----------------|-----------|
| hsl (HSL) | §19.5.46 |
| rgb (RGB) | §19.5.63 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLByAnimateColorTransform](#)) is located in §A.3. *end note*]

19.5.21 by (By)

This element describes the relative offset value for the animation.

[*Example:* Consider a shape with an animation effect that scales the size of an object by 150%. The <by> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:by x="150.000%" y="150.000%"/>
</p:animScale>
```

end example]

| Parent Elements |
|---|
| animMotion (§19.5.4); animScale (§19.5.6) |

| Attributes | Description |
|------------------|--|
| x (X coordinate) | This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| y (Y coordinate) | This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note*]

19.5.22 cBhvr (Common Behavior)

This element describes the common behaviors of animations.

[*Example:* Consider trying to emphasize text within a shape by changing the size of its font. The <anim> element should be used as follows:

```
<p:anim to="1.5" calcmode="lin" valueType="num">
  <p:cBhvr override="childStyle">
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="4294967295" end="4294967295"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>style.fontSize</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:anim>
```

end example]

| Parent Elements |
|---|
| anim (§19.5.1); animClr (§19.5.2); animEffect (§19.5.3); animMotion (§19.5.4); animRot (§19.5.5); animScale (§19.5.6); cmd (§19.5.28); set (§19.5.66) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| attrNameLst (Attribute Name List) | §19.5.8 |
| cTn (Common Time Node Properties) | §19.5.33 |
| tgtEl (Target Element) | §19.5.81 |

| Attributes | Description |
|-------------------------|--|
| accumulate (Accumulate) | This attribute makes a repeating animation build with each iteration when set to "always." |

| Attributes | Description |
|---------------------------|--|
| | The possible values for this attribute are defined by the ST_TLBehaviorAccumulateType simple type (§19.7.27). |
| additive (Additive) | <p>This attribute specifies how to apply the animation values to the original value for the property.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorAdditiveType simple type (§19.7.28).</p> |
| by (By) | <p>This attribute specifies a relative offset value for the animation..</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| from (From) | <p>This attribute specifies the starting value of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| override (Override) | <p>This attribute specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorOverrideType simple type (§19.7.29).</p> |
| rctx (Runtime Context) | <p>This attribute describes the runtime context of the animation. The currently-understood values are "PPT" and "IE." This is used to specify the behavior used when animating in the PPT slideshow vs. IE HTML runtime. An example can be seen with the transparency effect. In IE, the transparency is animated as a bitmap, where in PPT, the style.opacity property of a shape is used to animate the transparency.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| to (To) | <p>This attribute specifies the ending value of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| xfrmType (Transform Type) | <p>This attribute specifies the kind of transform to be used.</p> <p>The possible values for this attribute are defined by the ST_TLBehaviorTransformType simple type (§19.7.30).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLCommonBehaviorData](#)) is located in §A.3. *end note*]

19.5.23 charRg (Character Range)

This element specifies animation on a character range defined by a start and end character position.

[*Example:* Consider animating the first word (characters 1 through 9) within a sentence. The <charRg> element should be used as follows:

```
<p:animMotion>
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:charRg st="0" end="9"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:animMotion>
```

end example]

| Parent Elements |
|-----------------|
| txEl (§19.5.91) |

| Attributes | Description |
|------------|---|
| end (End) | This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |
| st (Start) | This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_IndexRange](#)) is located in §A.3. *end note]*

19.5.24 checker (Checker Slide Transition)

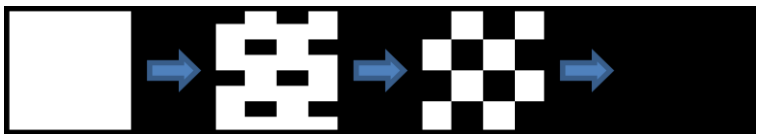

This element describes the checker slide transition effect, which uses a set of horizontal or vertical checkerboard squares and wipes them either left-to-right or top-to-bottom, respectively, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified.

[Example: Consider the following cases in which the “checker” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:checker dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:checker dir="vert"/>
</p:transition>
```

end example]

[Note: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|----------------------------|---|
| dir (Transition Direction) | <p>This attribute specifies a horizontal or vertical transition.</p> <p>The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2).</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note*]

19.5.25 childTnLst (Children Time Node List)

This element describes the list of time nodes that have a fixed location in the timing tree based on their parent time node. The children's start time is defined relative to their parent time node’s start.

| Parent Elements |
|-----------------|
| cTn (§19.5.33) |

| Child Elements | Subclause |
|----------------------------------|-----------|
| anim (Animate) | §19.5.1 |
| animClr (Animate Color Behavior) | §19.5.2 |
| animEffect (Animate Effect) | §19.5.3 |
| animMotion (Animate Motion) | §19.5.4 |
| animRot (Animate Rotation) | §19.5.5 |
| animScale (Animate Scale) | §19.5.6 |
| audio (Audio) | §19.5.9 |
| cmd (Command) | §19.5.28 |
| excl (Exclusive) | §19.5.40 |
| par (Parallel Time Node) | §19.5.53 |
| seq (Sequence Time Node) | §19.5.65 |
| set (Set Time Node Behavior) | §19.5.66 |
| video (Video) | §19.5.93 |

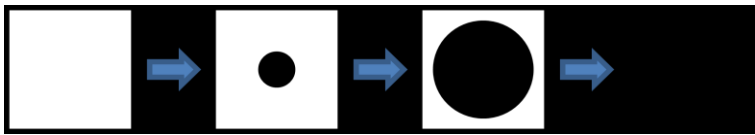

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TimeNodeList](#)) is located in §A.3. *end note*]

19.5.26 circle (Circle Slide Transition)

This element describes the circle slide transition effect, which uses a circle pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “circle” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:circle/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.27 clrVal (Color Value)

This element describes the color variant. This is used to specify a color that is to be used for animating the color property of an object.

[*Example:* Consider trying to emphasize text within a shape by changing the color its font.

```
<p:set>
  <p:cBhvr override="childStyle">
    ...
  </p:cBhvr>
  <p:to>
    <p:clrVal>
      <a:schemeClr val="accent2"/>
    </p:clrVal>
  </p:to>
</p:set>
```

end example]

| Parent Elements |
|--|
| progress (§19.5.57); to (§19.5.89); val (§19.5.92) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.5.28 cmd (Command)

This element describes the several non-durational commands that can be executed within a timeline. This can be used to send events, call functions on elements, and send verbs to embedded objects. For example "Object Action" effects for Embedded objects and Media commands for sounds/movies such as "PlayFrom(0.0)" and "togglePause".

| Parent Elements |

| | <table border="1" data-bbox="415 247 1481 365"> <tr> <td></td><td>corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning.</td></tr> </table> <p>Reserved Values (when type = "evt"):</p> <table border="1" data-bbox="415 474 1481 571"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>onstopaudio</td><td>stop play of all audio</td></tr> </table> <p>Reserved Values (when type = "verb"):</p> <table border="1" data-bbox="415 680 1481 823"> <tr> <th>Value</th><th>Description</th></tr> <tr> <td>0</td><td>Open the object for editing</td></tr> <tr> <td>1</td><td>Open the object for viewing</td></tr> </table> <p>The value of the cmd attribute shall be the string representation of an integer that represents the embedded object verb number. This verb number determines the action that the rendering application should take corresponding to this object when this point in the animation is reached.</p> <p>[Example: Consider the following command</p> <pre data-bbox="451 1113 1175 1587"> <p:cmd type="evt" cmd="onstopaudio"> <p:cBhvr> <p:cTn display="0" masterRel="sameClick"> <p:stCondLst> <p:cond evt="begin" delay="0"> <p:tn val="5"/> </p:cond> </p:stCondLst> </p:cTn> <p:tgtEl> <p:sldTgt/> </p:tgtEl> </p:cBhvr> </p:cmd> </pre> <p>end example]</p> <p>In the above example, the event of onstopaudio stops all audio from playing once this particular animation is reached in the timeline.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> | | corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning. | Value | Description | onstopaudio | stop play of all audio | Value | Description | 0 | Open the object for editing | 1 | Open the object for viewing |
| | corresponding media if media is already playing. If the corresponding media is not active, this command restarts the media and plays from its beginning. | | | | | | | | | | | | |
| Value | Description | | | | | | | | | | | | |
| onstopaudio | stop play of all audio | | | | | | | | | | | | |
| Value | Description | | | | | | | | | | | | |
| 0 | Open the object for editing | | | | | | | | | | | | |
| 1 | Open the object for viewing | | | | | | | | | | | | |

| Attributes | Description |
|---------------------|--|
| type (Command Type) | <p>This attribute specifies the kind of command that is issued by the rendering application to the appropriate target application or object.</p> <p>There are three possible values, call, evt, and verb. A call command type is used to specify the class of commands that can then be issued.</p> <p>Call commands (type="call"): This command type is used to call methods on the object specified (play(), pause(), etc.)</p> <p>Event Commands (type="evt"): This command type is used to set an event for the object at this point in the timeline (onstopaudio, etc.)</p> <p>Verb Commands (type="verb"): This command type is used to set verbs for the object to occur at this point in the timeline (0, 1, etc.)</p> <p>The possible values for this attribute are defined by the ST_TLCommandType simple type (§19.7.32).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLCommandBehavior](#)) is located in §A.3. *end note*]

19.5.29 cMediaNode (Common Media Node Properties)

This element is used to describe behavior of media elements, such as sound or movies, in an animation.

[Example: Consider a shape with a sound effect attached to its animation. The <cMediaNode> element should be used as follows:

```
<p:audio>
  <p:cMediaNode mute="1">
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> ... </p:stCondLst>
      <p:endCondLst> ... </p:endCondLst>
    </p:cTn>
    <p:tgtEl> ... </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

| Parent Elements |
|-----------------------------------|
| audio (§19.5.9); video (§19.5.93) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| cTn (Common Time Node Properties) | §19.5.33 |
| tgtEl (Target Element) | §19.5.81 |

| Attributes | Description |
|-------------------------------------|---|
| mute (Mute) | <p>This attribute describes whether the media should be mute.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| numSld (Number of Slides) | <p>This attribute describes the numbers of slides across which the media should play.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| showWhenStopped (Show When Stopped) | <p>This attribute describes whether the media should be displayed when it is stopped.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| vol (Volume) | <p>This attribute describes the volume of the media element.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLCommonMediaNodeData](#)) is located in §A.3. *end note*]

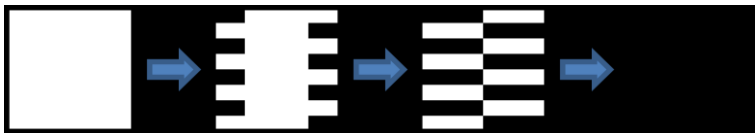

19.5.30 comb (Comb Slide Transition)

This element describes the comb slide transition effect, which uses a set of horizontal or vertical bars and wipes them from one end of the slide to the other until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

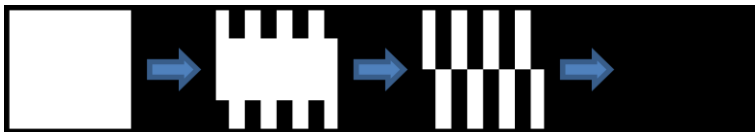

[Example: Consider the following cases in which the “comb” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
```

```
<p:comb dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:comb dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|----------------------------|--|
| dir (Transition Direction) | This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OrientationTransition](#)) is located in §A.3. *end note]*

19.5.31 cond (Condition)

This element specifies conditions on time nodes in a timeline. It is used within a list of start condition or list of end condition elements.

[*Example:* For example, suppose we have a shape with a two second delay after the animation is started.

```
<p:cTn>
  <p:stCondLst>
    <p:cond delay="2000"/>
  </p:stCondLst>
```

```

<p:childTnLst>
  <p:set> ... </p:set>
  <p:animEffect transition="in" filter="blinds(horizontal)">
    <p:cBhvr>
      <p:cTn id="7" dur="1000"/>
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
    </p:cBhvr>
  </p:animEffect>
</p:childTnLst>
</p:cTn>

```

end example]

| Parent Elements |
|---|
| endCondLst (§19.5.37); nextCondLst (§19.5.51); prevCondLst (§19.5.55); stCondLst (§19.5.73) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| rtn (Runtime Node Trigger Choice) | §19.5.64 |
| tgtEl (Target Element) | §19.5.81 |
| tn (Time Node) | §19.5.86 |

| Attributes | Description |
|-----------------------|--|
| delay (Trigger Delay) | <p>This attribute describes the delay after an animation is triggered.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p> |
| evt (Trigger Event) | <p>This attribute describes the event that triggers an animation.</p> <p>The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48).</p> |

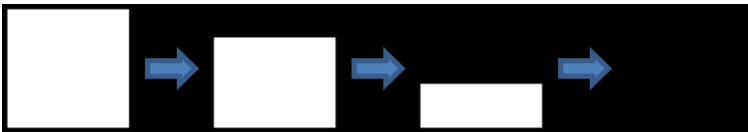

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTimeCondition](#)) is located in §A.3. *end note*]

19.5.32 cover (Cover Slide Transition)

This element describes the cover slide transition effect, which moves the new slide in from an off-screen location, continually covering more of the previous slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “cover” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:cover dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:cover dir="l"/>
</p:transition>
```

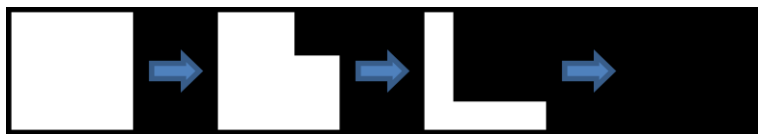

```
<p:transition>
  <p:cover dir="r"/>
</p:transition>
```

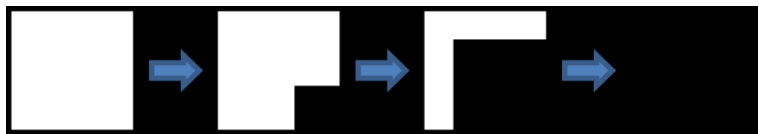

```
<p:transition>
  <p:cover dir="u"/>
</p:transition>
```

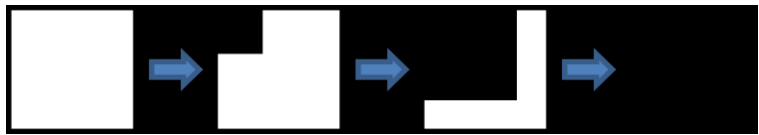

```
<p:transition>
  <p:cover dir="ld"/>
</p:transition>
```

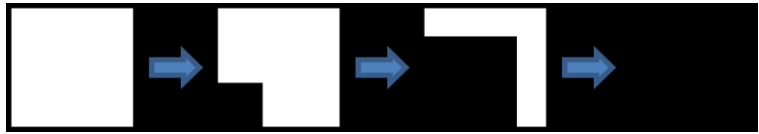

```
<p:transition>  
  <p:cover dir="lu"/>  
</p:transition>
```

```
<p:transition>  
  <p:cover dir="rd"/>  
</p:transition>
```

```
<p:transition>  
  <p:cover dir="ru"/>  
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|--|
| dir (Direction) | <p>This attribute specifies if the direction of the transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_EightDirectionTransition](#)) is located in §A.3. *end note*]

19.5.33 cTn (Common Time Node Properties)

This element describes the properties that are common for time nodes.

| Parent Elements |
|--|
| cBhvr (§19.5.22); cMediaNode (§19.5.29); excl (§19.5.40); par (§19.5.53); seq (§19.5.65) |

| Child Elements | Subclause |
|--------------------------------------|-----------|
| childTnLst (Children Time Node List) | §19.5.25 |
| endCondLst (End Conditions List) | §19.5.37 |
| endSync (EndSync) | §19.5.39 |
| iterate (Iterate) | §19.5.49 |
| stCondLst (Start Conditions List) | §19.5.73 |
| subTnLst (Sub-TimeNodes List) | §19.5.78 |

| Attributes | Description |
|----------------------------|--|
| accel (Acceleration) | <p>This attribute describes the percentage of specified duration over which the element's time takes to accelerate from 0 up to the "run rate."</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p> |
| afterEffect (After Effect) | <p>This attribute specifies whether there is an after effect applied to the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| autoRev (Auto Reverse) | <p>This attribute describes whether to automatically play the animation in reverse after playing it in the forward direction.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| bldLvl (Build level) | <p>This attribute describes the build level of the animation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p> |
| decel (Deceleration) | <p>This attribute describes the percentage of specified duration over which the element's time takes to decelerate from the "run rate" down to 0.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p> |

| Attributes | Description |
|-----------------------------|---|
| display (Display) | <p>This attribute describes whether the state of the time node is visible or hidden.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| dur (Duration) | <p>This attribute describes the duration of the time node, expressed as unit time.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p> |
| evtFilter (Event Filter) | <p>This attribute describes the event filter for this time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| fill (Fill) | <p>This attribute describes the fill type for the time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeFillType simple type (§19.7.41).</p> |
| grpId (Group ID) | <p>This attribute describes the Group ID of the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| id (ID) | <p>This attribute specifies the identifier for the timenode.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§19.7.42).</p> |
| masterRel (Master Relation) | <p>This attribute specifies how the time node plays back relative to its master time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeMasterRelation simple type (§19.7.43).</p> |
| nodePh (Node Placeholder) | <p>This attribute describes whether this node is a placeholder.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| nodeType (Node Type) | <p>This attribute specifies the type of time node.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeType simple type (§19.7.47).</p> |
| presetClass (Preset Types) | <p>This attribute describes the class of effect in which it belongs.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodePresetClassType simple type (§19.7.44).</p> |
| presetID (Preset ID) | <p>This attribute describes the preset identifier for the time node.</p> |

| Attributes | Description |
|--|--|
| | The possible values for this attribute are defined by the W3C XML Schema int datatype. |
| presetSubtype (Preset SubType) | <p>This attribute is a bitflag that specifies a direction or some other attribute of the effect. For example it can be set to specify a “From Bottom” for the Fly In effect, or “Bold” for the Change Font Style effect.</p> <p>The possible values for this attribute are defined by the W3C XML Schema int datatype.</p> |
| repeatCount (Repeat Count) | <p>This attribute describes the number of times the element should repeat, in units of thousandths.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p> |
| repeatDur (Repeat Duration) | <p>This attribute describes the amount of time over which the element should repeat. If absent, the attribute is taken to be the same as the specified duration.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p> |
| restart (Restart) | <p>This attribute specifies if a node is to restart when it completes its action.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeRestartType simple type (§19.7.45).</p> |
| spd (Speed) | <p>This attribute specifies the percentage by which to speed up (or slow down) the timing. If negative, the timing is reversed. <i>[Example: if speed is 200% and the specified duration is 10 seconds, the actual duration is 5 seconds. end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |
| syncBehavior (Synchronization Behavior) | <p>This attribute specifies how the time node synchronizes to its group.</p> <p>The possible values for this attribute are defined by the ST_TLTimeNodeSyncType simple type (§19.7.46).</p> |
| tmFilter (Time Filter) | <p>This attribute specifies the time filter for the time node.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLCommonTimeNodeData](#)) is located in §A.3. end note]

19.5.34 cut (Cut Slide Transition)

This element describes the cut slide transition effect, which simply replaces the previous slide with the new slide instantaneously. No animation is used, but an option exists to cut to a black screen before showing the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “cut” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:cut thruBlk="0"/>
</p:transition>
```

```
<p:transition>
  <p:cut thruBlk="1"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|------------------------------------|--|
| thruBlk (Transition Through Black) | <p>This attribute specifies if the transition starts from a black screen (and then transition the new slide over black).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

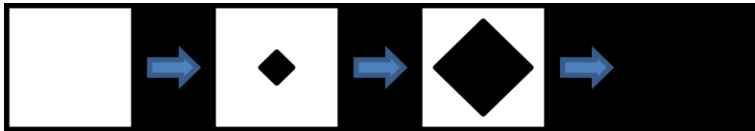

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OptionalBlackTransition](#)) is located in §A.3. *end note]*

19.5.35 diamond (Diamond Slide Transition)

This element describes the diamond slide transition effect, which uses a diamond pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[Example: Consider the following case in which the “diamond” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:diamond/>
</p:transition>
```

end example]

[Note: Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. end note]

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. end note]

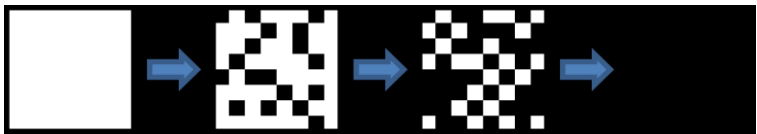

19.5.36 dissolve (Dissolve Slide Transition)

This element describes the dissolve slide transition effect, which uses a set of randomly placed squares on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition has been shown below.

[Example: Consider the following case in which the “dissolve” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:dissolve/>
```

</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Empty) is located in §A.3. *end note]*

19.5.37 endCondLst (End Conditions List)

This element describes a list of the end conditions that shall be met in order to stop the time node.

[*Example:* Consider a shape a shape with an audio attached to the animation. The <endCondList> element should be used as follows to specifies when the sound is done:

```
<p:audio>
  <p:cMediaNode>
    <p:cTn display="0" masterRel="sameClick">
      <p:stCondLst> ... </p:stCondLst>
      <p:endCondLst>
        <p:cond evt="onStopAudio" delay="0">
          <p:tgtEl>
            <p:sldTgt/>
          </p:tgtEl>
        </p:cond>
      </p:endCondLst>
    </p:cTn>
    <p:tgtEl> ... </p:tgtEl>
  </p:cMediaNode>
</p:audio>
```

end example]

| Parent Elements |
|-----------------|
| cTn (§19.5.33) |

| Child Elements | Subclause |
|------------------|-----------|
| cond (Condition) | §19.5.31 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.38 endSnd (Stop Sound Action)

This element stops all previous sounds during a slide transition.

[*Example:* Consider a slide transition that stops all previous sounds. The <endSnd> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:endSnd/>
  </p:sndAc>
</p:transition>
```

end example]

| Parent Elements |
|------------------|
| sndAc (§19.5.69) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.39 endSync (EndSync)

This element is used to synchronizes the stopping of parallel elements in the timing tree. It is used on interactive timeline sequences to specify that the interactive sequence's duration ends when all of the child timenodes have ended. It is also used to make interactive sequences restart-able (so that the entire interactive sequence can be repeated if the trigger object is clicked on repeatedly).

[*Example:* Consider a shape with a fill change animation. The <endSync> element should be used as follows:

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn>
    <p:stCondLst/>
    <p:endSync evt="end" delay="0">
      <p:rtn val="all"/>
    </p:endSync>
  <p:childTnLst/>
```

```
</p:cTn>
<p:nextCondLst/>
</p:seq>
```

end example]

| Parent Elements |
|-----------------|
| cTn (§19.5.33) |

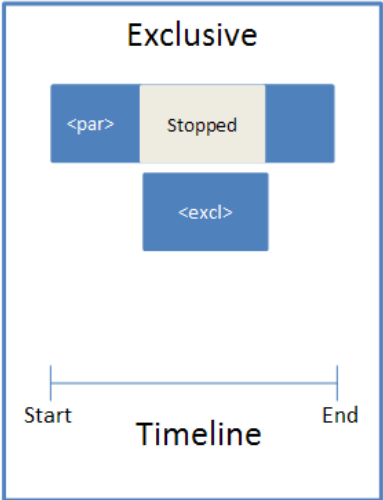

| Child Elements | Subclause |
|-----------------------------------|-----------|
| rtn (Runtime Node Trigger Choice) | §19.5.64 |
| tgtEl (Target Element) | §19.5.81 |
| tn (Time Node) | §19.5.86 |

| Attributes | Description |
|-----------------------|---|
| delay (Trigger Delay) | This attribute describes the delay after an animation is triggered. The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38). |
| evt (Trigger Event) | This attribute describes the event that triggers an animation. The possible values for this attribute are defined by the ST_TLTriggerEvent simple type (§19.7.48). |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TLTimeCondition](#)) is located in §A.3. *end note*]

19.5.40 **excl (Exclusive)**

This element describes the Exclusive time node. This time node is used to pause all other timelines when it is activated. Conceptually it can be though of as follows:

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| cTn (Common Time Node Properties) | §19.5.33 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTimeNodeExclusive](#)) is located in §A.3. end note]

19.5.41 fade (Fade Slide Transition)

This element describes the fade slide transition effect, which smoothly fades the previous slide either directly to the new slide or first to a black screen and then to the new slide. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “fade” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>  
  <p:fade thruBlk="0"/>  
</p:transition>
```

```
<p:transition>
  <p:fade thruBlk="1"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|------------------------------------|--|
| thruBlk (Transition Through Black) | <p>This attribute specifies if the transition starts from a black screen (and then transition the new slide over black).</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_OptionalBlackTransition](#)) is located in §A.3. *end note]*

19.5.42 fltVal (Float Value)

This element specifies a floating point value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

| Parent Elements |
|--|
| progress (§19.5.57); to (§19.5.89); val (§19.5.92) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>This attribute specifies the floating point value that this element contains and that should be used in evaluating this element.</p> <p>The possible values for this attribute are defined by the W3C XML Schema float datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantFloatVal](#)) is located in §A.3. *end note*]

19.5.43 from (From)

This element is used to specify the starting color of the target element.

[*Example:* Consider a shape with an animation fill change from one accent color to another. The <from> element should be used as follows:

```
<p:animClr clrSpc="rgb" dir="cw">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl> ... </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>fillcolor</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:from>
    <a:schemeClr val="accent3"/>
  </p:from>
  <p:to>
    <a:schemeClr val="accent2"/>
  </p:to>
</p:animClr>
```

end example]

| Parent Elements |
|-------------------|
| animClr (§19.5.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.5.44 from (From)

This element specifies an x/y co-ordinate to start the animation from.

[*Example:* Consider a shape with an animation sequence that needs to start at a certain coordinate. The <from> element should be used as follows:

```
<p:animScale>
  <p:cBhvr>
    <p:cTn> ... </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100%" y="100%"/>
  <p:to x="80%" y="100%"/>
</p:animScale>
```

end example]

| Parent Elements |
|---|
| animMotion (§19.5.4); animScale (§19.5.6) |

| Attributes | Description |
|------------------|--|
| x (X coordinate) | This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| y (Y coordinate) | This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLPoint](#)) is located in §A.3. *end note]*

19.5.45 graphicEl (Graphic Element)

This element specifies a graphical element which to animate.

[*Example:* Consider a diagram with an animation effect applied to it. The <graphicEl> element should be used as follows:

```
<p:set>
```

```

<p:cBhvr>
  <p:cTn id="6" dur="1" fill="hold"> ... </p:cTn>
  <p:tgtEl>
    <p:spTgt spid="4">
      <p:graphicEl>
        <a:dgm id="{87C2C707-C3F4-4E81-A967-A8B8AE13E575}"/>
      </p:graphicEl>
    </p:spTgt>
  </p:tgtEl>
  <p:attrNameLst> ... </p:attrNameLst>
</p:cBhvr>
<p:to> ... </p:to>
</p:set>

```

end example]

| Parent Elements |
|------------------|
| spTgt (§19.5.72) |

| Child Elements | Subclause |
|--------------------------|--------------|
| chart (Chart to Animate) | §20.1.2.2.3 |
| dgm (Diagram to Animate) | §20.1.2.2.12 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AnimationElementChoice](#)) is located in §A.4.1. *end note*]

19.5.46 hsl (HSL)

This element specifies an incremental HSL (Hue, Saturation, Lightness) value to add to a color animation.

[*Example:* Consider a shape with a lightening emphasis animation. The <hsl> element should be used as follows:

```

<p:animClr clrSpc="hsl">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
</p:by>

```

```
<p:hs1 h="0" s="0" l="0"/>
</p:by>
</p:animClr>
```

end example]

| Parent Elements |
|-----------------|
| by (§19.5.20) |

| Attributes | Description |
|----------------|---|
| h (Hue) | Specifies hue as an angle. The values range from [0, 360] degrees. The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3). |
| l (Lightness) | Specifies a lightness as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |
| s (Saturation) | Specifies a saturation as a percentage. The values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLByHslColorTransform](#)) is located in §A.3. *end note*]

19.5.47 inkTgt (Ink Target)

This element specifies an animation target element that is represented by a sub-shape in a legacy graphical object.

[*Example:* Consider an ink diagram with an animation blinds transition effect applied to it. The <inkTgt> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:inkTgt spid="_x0000_s2057"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

| Parent Elements |
|------------------|
| tgtEl (§19.5.81) |

| Attributes | Description |
|-----------------|---|
| spid (Shape ID) | This attribute specifies the shape identifier. The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLSubShapeId](#)) is located in §A.3. *end note*]

19.5.48 intVal (Integer)

This element specifies an integer value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

| Parent Elements |
|--|
| progress (§19.5.57); to (§19.5.89); val (§19.5.92) |

| Attributes | Description |
|-------------|---|
| val (Value) | This attribute specifies the integer value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema int datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantIntegerVal](#)) is located in §A.3. *end note*]

19.5.49 iterate (Iterate)

This element specifies how the animation should be successively applied to sub elements of the target element for a repeated effect. It can be applied to contained timing and animation structures over the letters, words, or shapes within a target element.

[Example: Consider a text animation where the words appear letter by letter. The <iterate> element should be used as follows:

```
<p:par>
```

```
<p:cTn id="1" >
  <p:stCondLst> ... </p:stCondLst>
  <p:iterate type="lt">
    <p:tmPct val="10000"/>
  </p:iterate>
  <p:childTnLst> ... </p:childTnLst>
</p:cTn>
</p:par>
```

end example]

| Parent Elements |
|-----------------|
| cTn (§19.5.33) |

| Child Elements | Subclause |
|-------------------------|-----------|
| tmAbs (Time Absolute) | §19.5.82 |
| tmPct (Time Percentage) | §19.5.83 |

| Attributes | Description |
|--------------------------|--|
| backwards (Backwards) | This attribute specifies whether to go backwards in the timeline to the previous node. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| type (Iterate Type) | This attribute specifies the iteration behavior and applies it to each letter, word or shape within a container element. Values are by word, by letter, or by element. If there is no text or block elements such as shapes within the container or a single word, letter, or shape (depending on iterate type) then no iteration happens and the behavior is applied to the element itself instead. The possible values for this attribute are defined by the ST_IterateType simple type (§19.7.4). |

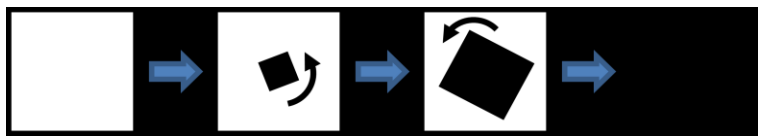

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLIterateData](#)) is located in §A.3.
end note]

19.5.50 newsflash (Newsflash Slide Transition)

This element describes the newsflash slide transition effect, which grows and spins the new slide counter-clockwise into place over the previous slide. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “newsflash” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:newsflash/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.51 nextCondLst (Next Conditions List)

This element describes a list of conditions that shall be met to advance to the next animation sequence.

[*Example:* Consider a shape with a text emphasis changing the size of its font.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> ... </p:cTn>
  <p:prevCondLst> ... </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

end example]

| Parent Elements |
|-----------------|
| seq (§19.5.65) |

| Child Elements | Subclause |
|------------------|-----------|
| cond (Condition) | §19.5.31 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.52 **oleChartEl (Embedded Chart Element)**

This element specifies the subelement of an embedded chart to animate.

[*Example:* Consider an embedded Chart with a entrance animation effect applied to each of the graph's categories. The <oleChartEl> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="19460">
        <p:oleChartEl type="category" lvl="1"/>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

| Parent Elements |
|------------------|
| spTgt (§19.5.72) |

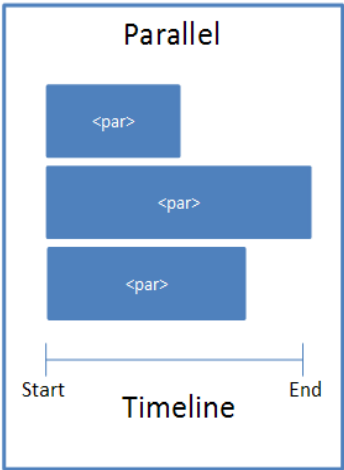

| Attributes | Description |
|-------------|---|
| lvl (Level) | This attribute describes the element levels to animate. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| type (Type) | This attribute specifies how to chart should be built during its animation. The possible values for this attribute are defined by the ST_TLChartSubelementType |

| Attributes | Description |
|------------|-------------------------|
| | simple type (§19.7.31). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLOleChartTargetElement](#)) is located in §A.3. *end note*]

19.5.53 par (Parallel Time Node)

This element describes the Parallel time node which can be activated along with other parallel time node containers. Conceptually it can be thought of as follows:

[Example: Consider a simple animation with a blind entrance. The <par> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| cTn (Common Time Node Properties) | §19.5.33 |

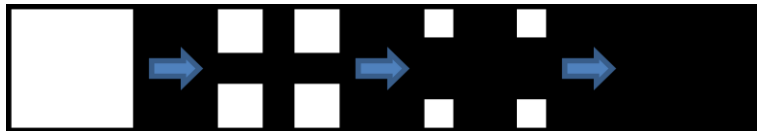

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLTimeNodeParallel](#)) is located in §A.3. *end note*]

19.5.54 plus (Plus Slide Transition)

This element describes the plus slide transition effect, which uses a plus pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “plus” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:plus/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.55 prevCondLst (Previous Conditions List)

This element describes a list of conditions that shall be met in order to go backwards in an animation sequence.

[*Example:* Consider trying to emphasize text within a shape by changing the size of its font.

```

<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq">
    </p:cTn>
    <p:prevCondLst>
      <p:cond evt="onPrev" delay="0">
        <p:tgtEl>
          <p:sldTgt/>
        </p:tgtEl>
      </p:cond>
    </p:prevCondLst>
    <p:nextCondLst>
    </p:nextCondLst>
  </p:seq>

```

end example]

| Parent Elements |
|-----------------|
| seq (§19.5.65) |

| Child Elements | Subclause |
|------------------|-----------|
| cond (Condition) | §19.5.31 |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.56 pRg (Paragraph Text Range)

This element specifies a text range to animate based on starting and ending paragraph number.

[Example: Consider an animation entrance of the first 3 text paragraphs. The <pRg> element should be used as follows:

```

<p:animEffect transition="in" filter="checkerboard(across)">
  <p:cBhvr>
    <p:cTn id="12" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="3">
        <p:txEl>
          <p:pRg st="0" end="2"/>
        </p:txEl>
      </p:spTgt>
    </p:tgtEl>
  </p:cBhvr>

```

</p:animEffect>

end example]

| Parent Elements |
|-----------------|
| txEl (§19.5.91) |

| Attributes | Description |
|------------|---|
| end (End) | This attribute defines the end of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |
| st (Start) | This attribute defines the start of the index range. The possible values for this attribute are defined by the ST_Index simple type (§19.7.3). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_IndexRange](#)) is located in §A.3. *end note*]

19.5.57 progress (Progress)

This element defines the progression of an animation. The default for the way animation progress happens through an animEffect is a linear ramp from 0 to 1, starting at the effect’s begin time & ending at the effect’s end time. When you specify a value for the progress attribute, you are overriding this default behaviour. The value between 0 and 1 represents a percentage through the effect, where 0 is 0% and 1 is 100%.

Each animEffect is in fact an object-based transition. These transitions can be specified as “In” (where the object is not visible at 0% and becomes completely visible at 100%) or “Out” (where the object is visible at 0% and becomes completely invisible at 100%). You would set the progress attribute if you want to use the animEffect as a “static” effect, where the transition properties do not actually change over time. As an alternative to using the progress attribute, you can use the tmFilter (time filter), which is a base attribute of any effect/timemode, to specify the way that progress through an effect should be performed dynamically.

| Parent Elements |
|----------------------|
| animEffect (§19.5.3) |

| Child Elements | Subclause |
|---------------------------|-----------|
| boolVal (Boolean Variant) | §19.5.19 |
| clrVal (Color Value) | §19.5.27 |
| fltVal (Float Value) | §19.5.42 |
| intVal (Integer) | §19.5.48 |

| Child Elements | Subclause |
|-----------------------|-----------|
| strVal (String Value) | §19.5.75 |

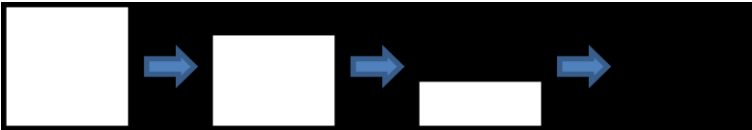

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLAnimVariant](#)) is located in §A.3.
end note]

19.5.58 pull (Pull Slide Transition)

This element describes the pull slide transition effect, which moves the previous slide to an off-screen location, continually revealing more of the new slide until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “pull” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:pull dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="l"/>
</p:transition>
```

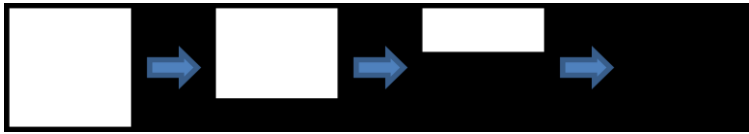

```
<p:transition>
  <p:pull dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="u"/>
```

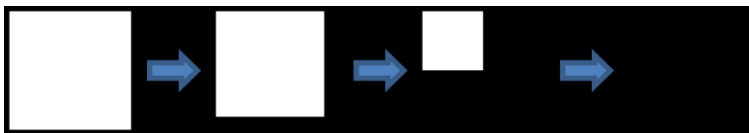

</p:transition>

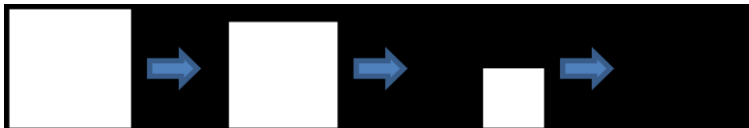

```
<p:transition>
  <p:pull dir="ld"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="lu"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="rd"/>
</p:transition>
```

```
<p:transition>
  <p:pull dir="ru"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|--|
| dir (Direction) | <p>This attribute specifies if the direction of the transition.</p> <p>The possible values for this attribute are defined by the ST_TransitionEightDirectionType simple type (§19.7.51).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_EightDirectionTransition](#)) is located in §A.3. end note]

19.5.59 push (Push Slide Transition)

This element describes the push slide transition effect, which moves the new slide in from an off-screen location, continually pushing the previous slide to an opposite off-screen location until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “push” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:push dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:push dir="l"/>
</p:transition>
```

```
<p:transition>
  <p:push dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:push dir="u"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|---|
| dir (Direction) | This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SideDirectionTransition](#)) is located in §A.3. *end note]*

19.5.60 random (Random Slide Transition)

This element describes the random slide transition effect, which chooses a random transition from the set available in the rendering application. This transition thus can be different each time it is used.

[*Example:* Consider the following case in which the “random” slide transition is applied to a slide, along with a set of attributes. The proper usage is shown below:

```
<p:transition>
  <p:random/>
</p:transition>
```

end example]

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

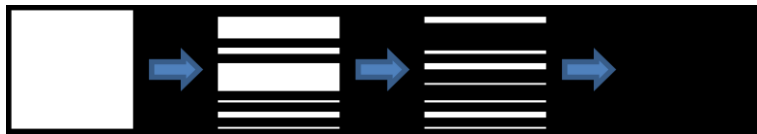

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note*]

19.5.61 randomBar (Random Bar Slide Transition)

This element describes the randomBar slide transition effect, which uses a set of randomly placed horizontal or vertical bars on the slide that continue to be added to until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “randomBar” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:randomBar dir="horz"/>
</p:transition>
```

```
<p:transition>
  <p:randomBar dir="vert"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note*]

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|----------------------------|--|
| dir (Transition Direction) | This attribute specifies a horizontal or vertical transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |

[Note: The W3C XML Schema definition of this element's content model ([CT_OrientationTransition](#)) is located in §A.3. *end note*]

19.5.62 rCtr (Rotation Center)

This element describes the center of the rotation used to rotate a motion path by X angle.

[Example: For example, suppose we have a simple animation with a checkbox text entrance.

```
<p:animMotion origin="layout" path="M 0 0 L 0.25 0.33333 E"
pathEditMode="relative" rAng="0" ptsTypes="">
  <p:cBhvr>
    <p:cTn id="6" dur="2000" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>ppt_x</p:attrName>
      <p:attrName>ppt_y</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:rCtr x="56.7%" y="83.4%"/>
</p:animMotion>
```

end example]

| Parent Elements |
|----------------------|
| animMotion (§19.5.4) |

| Attributes | Description |
|------------------|--|
| x (X coordinate) | This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| y (Y coordinate) | This attribute describes the Y coordinate. |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note*]

19.5.63 rgb (RGB)

The element specifies an incremental RGB value to add to the color property.

[Example: Consider a shape with a color emphasis animation. The <rgb> element should be used as follows:

```
<p:animClr clrSpc="rgb">
  <p:cBhvr>
    <p:cTn id="8" dur="500" fill="hold"/>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
    <p:attrNameLst>
      <p:attrName>stroke.color</p:attrName>
    </p:attrNameLst>
  </p:cBhvr>
  <p:by>
    <p:rgb r="10" g="20" b="30"/>
  </p:by>
</p:animClr>
```

end example]

| Parent Elements |
|-----------------|
| by (§19.5.20) |

| Attributes | Description |
|------------|--|
| b (Blue) | This attribute specifies a blue component luminance as a percentage. Values are in the range [-100%, 100%]. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |
| g (Green) | This attribute specifies a green component luminance as a percentage. |

| Attributes | Description |
|------------|--|
| | <p>Values are in the range [-100%, 100%].</p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).</p> |
| r (Red) | <p>This attribute specifies a red component luminance as a percentage. Values are in the range [-100%, 100%].</p> <p>The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLByRgbColorTransform](#)) is located in §A.3. *end note*]

19.5.64 rtn (Runtime Node Trigger Choice)

This element specifies the child time node that triggers a time condition. References a child time node or all child nodes. Order is based on the child's end time.

[*Example:* Consider an animation which ends the synchronization of all parallel time nodes when all the child nodes have ended their animation. The <rtn> element should be used as follows:

```
<p:cTn>
  <p:stCondLst> ... </p:stCondLst>
  <p:endSync evt="end" delay="0">
    <p:rtn val="all"/>
  </p:endSync>
  <p:childTnLst> ... </p:childTnLst>
</p:cTn>
```

end example]

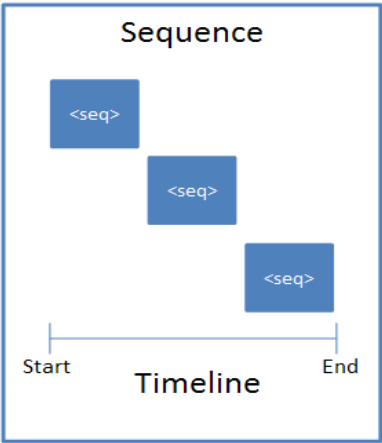

| Parent Elements |
|-------------------------------------|
| cond (§19.5.31); endSync (§19.5.39) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>This attribute describes the value that triggers the runtime node.</p> <p>The possible values for this attribute are defined by the ST_TLTriggerRuntimeNode simple type (§19.7.49).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTriggerRuntimeNode](#)) is located in §A.3. *end note*]

19.5.65 seq (Sequence Time Node)

This element describes the Sequence time node and it can only be activated when the one before it finishes. Conceptually it can be though of as follows:

[Example: For example, suppose we have a simple animation with a blind entrance.

```
<p:timing>
  <p:tnLst>
    <p:par>
      <p:cTn id="1" dur="indefinite" restart="never" nodeType="tmRoot">
        <p:childTnLst>
          <p:seq concurrent="1" nextAc="seek">
            ...
          </p:seq>
        </p:childTnLst>
      </p:cTn>
    </p:par>
  </p:tnLst>
</p:timing>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|-----------------------------------|-----------|
| cTn (Common Time Node Properties) | §19.5.33 |

| Child Elements | Subclause |
|--|-----------|
| nextCondLst (Next Conditions List) | §19.5.51 |
| prevCondLst (Previous Conditions List) | §19.5.55 |

| Attributes | Description |
|----------------------------|---|
| concurrent (Concurrent) | <p>This attribute specifies if concurrency is enabled or disabled. By default this attribute has a value of "disabled". When the value is set to "enabled", the previous element is left enabled when advancing to the next element in a sequence instead of being ended. This is only relevant for advancing via the next condition element being triggered. The only other way to advance to the next element would be to have the current element end, which implies it is no longer concurrent.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| nextAc (Next Action) | <p>This attribute specifies what to do when going forward in sequence. By default this attribute has a value of "none". When this is set to seek it seeks the element to a natural end time (not necessarily the actual end time).</p> <p>The natural end position is defined as the latest non-infinite end time of the children. If a child loops forever, the end of its first loop is used as its "end time" for the purposes of this calculation.</p> <p>Some container elements can have infinite durations due to an infinite-duration child element. The engine needs to recurse down through all infinite duration containers to calculate their natural duration in case a child might have non-infinite duration within it that needs to be taken into account.</p> <p>The possible values for this attribute are defined by the ST_TLNextActionType simple type (§19.7.34).</p> |
| prevAc (Previous Action) | <p>This attribute specifies what to do when going backwards in a sequence. By default it is set to "none" and nothing special is done. When the value is "skipTimed", the sequence continues to go backwards until it reaches a sequence element that was defined to begin only on the next condition element.</p> <p>The possible values for this attribute are defined by the ST_TLPreviousActionType simple type (§19.7.37).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeNodeSequence](#)) is located in §A.3. end note]

19.5.66 set (Set Time Node Behavior)

This element allows the setting of a particular property value to a fixed value while the behavior is active and restores the value when the behavior is reset or turned off.

[*Example:* For example, suppose we want to set certain properties during an animation effect. The <set> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr>
      <p:cTn id="6" dur="1" fill="hold"> ... </p:cTn>
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
      <p:attrNameLst>
        <p:attrName>style.visibility</p:attrName>
      </p:attrNameLst>
    </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:animEffect transition="in" filter="blinds(horizontal)">
    ...
  </p:animEffect>
</p:childTnLst>
```

end example]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |

| cBhvr (Common Behavior) | §19.5.22 |
| to (To) | §19.5.89 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLSetBehavior](#)) is located in §A.3.
end note]

19.5.67 sldTgt (Slide Target)

This element specifies the slide as the target element.

[Example: For example, suppose we have a simple animation with a blind entrance.

```
<p:seq concurrent="1" nextAc="seek">
  <p:cTn id="2" dur="indefinite" nodeType="mainSeq"> ... </p:cTn>
  <p:prevCondLst> ... </p:prevCondLst>
  <p:nextCondLst>
    <p:cond evt="onNext" delay="0">
      <p:tgtEl>
        <p:sldTgt/>
      </p:tgtEl>
    </p:cond>
  </p:nextCondLst>
</p:seq>
```

end example]

| Parent Elements |
|------------------|
| tgtEl (§19.5.81) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. end note]

19.5.68 **snd (Sound)**

This element specifies the audio information to play during a slide transition.

[Example: Consider a slide transition with an audio effect. The <snd> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>
```

end example]

| Parent Elements |
|------------------|
| stSnd (§19.5.76) |

| Attributes | Description |
|-----------------------------|---|
| embed (Embedded Audio File) | Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [Note: A list of |

| Attributes | Description |
|---|--|
| Relationship ID) | suggested audio types is provided in §15.2.2. <i>end note</i> |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| name (Sound Name) | Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. |
| Namespace: http://purl.oclc.org/ooxml/drawingml/main | The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

19.5.69 sndAc (Sound Action)

This element describes a sound action for slide transition. This element specifies that the start of the slide transition is accompanied by the playback of an audio file; the actual audio file used is specified by the snd element (§19.5.68).

[*Example:* Consider a slide transition with a sound effect. The <sndAc> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>
```

end example]

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Child Elements | Subclause |
|----------------------------|-----------|
| endSnd (Stop Sound Action) | §19.5.38 |
| stSnd (Start Sound Action) | §19.5.76 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TransitionSoundAction](#)) is located in §A.3. *end note*]

19.5.70 sndTgt (Sound Target)

This element describes the sound information for a target object.

[*Example:* Consider a shape with a sound effect animation. The <sndTgt> element should be used as follows:

```
<p:subTnLst>
  <p:audio>
    <p:cMediaNode>
      <p:cTn display="0" masterRel="sameClick"> ... </p:cTn>
      <p:tgtEl>
        <p:sndTgt r:embed="rId2" r:link="rId3"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:audio>
</p:subTnLst>
```

end example]

| Parent Elements |
|------------------|
| tgtEl (§19.5.81) |

| Attributes | Description |
|--|---|
| embed (Embedded Audio File Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>] The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| name (Sound Name) Namespace: http://purl.oclc.org/ooxml/drawingml/main | Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

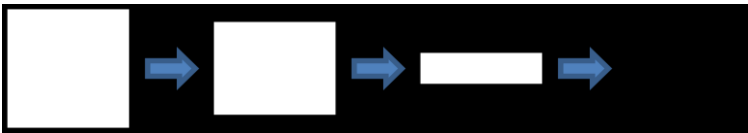

[Note: The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

19.5.71 split (Split Slide Transition)

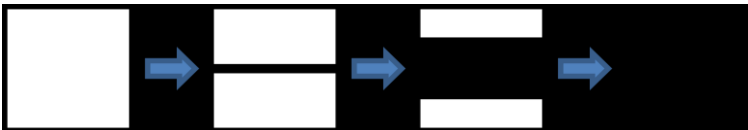

This element describes the split slide transition effect, which reveals the new slide directly on top of the previous one by wiping either horizontal or vertical from the outside in, or from the inside out, until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “split” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:split orient="horz" dir="in"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="horz" dir="out"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="vert" dir="in"/>
</p:transition>
```

```
<p:transition>
  <p:split orient="vert" dir="out"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|----------------------|--|
| dir (Direction) | This attribute specifies the direction of a "split" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52). |
| orient (Orientation) | This attribute specifies the orientation of a "split" slide transition. The possible values for this attribute are defined by the ST_Direction simple type (§19.7.2). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SplitTransition](#)) is located in §A.3. *end note]*

19.5.72 spTgt (Shape Target)

The element specifies the shape in which to apply a certain animation to.

[*Example:* Consider a shape whose id is 3 in which we want to apply a fade animation effect. The <spTgt> should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

| Parent Elements |
|------------------|
| tgtEl (§19.5.81) |

| Child Elements | Subclause |
|-------------------------------------|-----------|
| bg (Background) | §19.5.10 |
| graphicEl (Graphic Element) | §19.5.45 |
| oleChartEl (Embedded Chart Element) | §19.5.52 |
| subSp (Subshape) | §19.5.77 |
| txEl (Text Element) | §19.5.91 |

| Attributes | Description |
|-----------------|--|
| spid (Shape ID) | <p>This attribute specifies the shape identifier.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLShapeTargetElement](#)) is located in §A.3. *end note*]

19.5.73 stCondLst (Start Conditions List)

This element contains a list conditions that shall be met for a time node to be activated.

[*Example:* For example, suppose we have a shape with an entrance appearance after 5 seconds. The <stCondLst>element should be used as follows:

```
<p:par>
  <p:cTn id="5" nodeType="clickEffect">
    <p:stCondLst>
      <p:cond delay="5000"/>
    </p:stCondLst>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>
```

end example]

| Parent Elements |
|-----------------|
| cTn (§19.5.33) |

| Child Elements | Subclause |
|------------------|-----------|
| cond (Condition) | §19.5.31 |

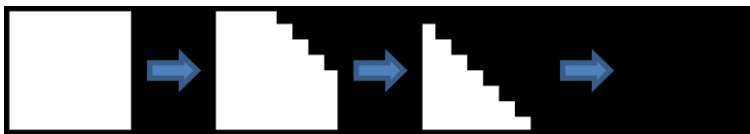

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLTimeConditionList](#)) is located in §A.3. *end note*]

19.5.74 strips (Strips Slide Transition)

This element describes the strips slide transition effect, which uses a set of bars that are arranged in a staggered fashion and wipes them across the screen until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “strips” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:strips dir="ld"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="lu"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="rd"/>
</p:transition>
```

```
<p:transition>
  <p:strips dir="ru"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|--|
| dir (Direction) | This attribute specifies if the direction of the transition. The possible values for this attribute are defined by the ST_TransitionCornerDirectionType simple type (§19.7.50). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CornerDirectionTransition](#)) is located in §A.3. *end note]*

19.5.75 strVal (String Value)

This element specifies a string value to be used for evaluation by a parent element. The exact meaning of the value contained within this element is not defined here but is dependent on the usage of this element in conjunction with one of the listed parent elements.

| Parent Elements |
|--|
| progress (§19.5.57); to (§19.5.89); val (§19.5.92) |

| Attributes | Description |
|-------------|---|
| val (Value) | This attribute specifies the string value that this element contains and that should be used in evaluating this element. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TLAnimVariantStringVal](#)) is located in §A.3. *end note]*

19.5.76 stSnd (Start Sound Action)

This element describes the sound that starts playing during a slide transition.

[Example: Consider a slide transition that starts with a sound effect. The <stSnd> element should be used as follows:

```
<p:transition>
  <p:sndAc>
    <p:stSnd>
      <p:snd r:embed="rId2"/>
    </p:stSnd>
  </p:sndAc>
</p:transition>
```

end example]

| Parent Elements |
|------------------|
| sndAc (§19.5.69) |

| Child Elements | Subclause |
|----------------|-----------|
| snd (Sound) | §19.5.68 |

| Attributes | Description |
|-------------------|---|
| loop (Loop Sound) | This attribute specifies if the sound loops until the next sound event occurs in slideshow. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element’s content model ([CT TransitionStartSoundAction](#)) is located in §A.3. end note]

19.5.77 subSp (Subshape)

This element specifies the subshape of a legacy graphical object to animate.

[Example: Consider adding animation to a legacy diagram. The <subSp> element should be used as follows:

```
<p:animEffect transition="in" filter="blinds(horizontal)">
  <p:cBhvr>
    <p:cTn id="7" dur="500"/>
    <p:tgtEl>
      <p:spTgt spid="2053">
        <p:subSp spid="_x0000_s70664"/>
      </p:spTgt>
    </p:tgtEl>
```

```

    </p:cBhvr>
  </p:animEffect>

```

end example]

| Parent Elements |
|------------------|
| spTgt (§19.5.72) |

| Attributes | Description |
|-----------------|--|
| spid (Shape ID) | <p>This attribute specifies the shape identifier.</p> <p>The possible values for this attribute are defined by the ST_ShapeID simple type (§20.1.10.54).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLSubShapeId](#)) is located in §A.3.
end note]

19.5.78 subTnLst (Sub-TimeNodes List)

This element describes time nodes that have a start time which is not based on the containing timenode. It is instead based on their master relationship (masterRel). At runtime, they are inserted dynamically into the timing tree as child timenodes for playback, based on the logic defined by the master relationship. These elements are used for animations such as "dim after" and "play sound effects"

[Example: Consider an animation with a "Fly In" effect on paragraphs so that each paragraph flies in on a separate click. Then the "Dim After" effect for paragraph 1 does not happen until paragraph 2 flies in. The <subTnLst> element should be used as follows:

```

<p:par>
  <p:cTn id="5" grpId="0" nodeType="clickEffect">
    <p:stCondLst> ... </p:stCondLst>
    <p:childTnLst> ... </p:childTnLst>
    <p:subTnLst>
      <p:set>
        <p:cBhvr override="childStyle">
          <p:cTn fill="hold" masterRel="nextClick" afterEffect="1"/>
          <p:tgtEl> ... </p:tgtEl>
          <p:attrNameLst> ... </p:attrNameLst>
        </p:cBhvr>
        <p:to> ... </p:to>
      </p:set>
    </p:subTnLst>
  </p:cTn>

```

</p:par>

end example]

| Parent Elements |
|-----------------|

| Attributes | Description |
|------------|--|
| | <pre> <p:cBhvr> <p:cTn id="9" dur="664" tmFilter="0.0,0.0; 0.25,0.07; 0.50,0.2; 0.75,0.467; 1.0,1.0"> <p:stCondLst> <p:cond delay="0"/> </p:stCondLst> </p:cTn> <p:tgtEl> <p:spTgtspid="4"/> </p:tgtEl> <p:attrNameLst> <p:attrName>ppt_y</p:attrName> </p:attrNameLst> </p:cBhvr> <p:tavLst> <p:tav tm="0%" fmla="#ppt_y-sin(pi*\$)/3"> <p:val> <p:fltValval="0.5"/> </p:val> </p:tav> <p:tav tm="100%"> <p:val> <p:fltValval="1"/> </p:val> </p:tav> </p:tavLst> </p:anim> </pre> <p>The animation example above modifies the ppt_y variable of the object by subtracting $\sin(\pi * \\$)/3$ from the non-animated value of ppt_y. The start value is 0.5 and the end value is 1 specified in each of the val elements. The total time for this animation is specified within the dur attribute and the filtered time graph is specified by the tmFilter attribute. The end result is that the object moves from a point above its non-animated position back to its non-animated position. With the specification of the tmFilter it has a modified time graph such that it also appears to accelerate as it reaches its final position.</p> <p>[Note: For this example, the non-animated value of ppt_y is the value of this variable if the object were to be statically rendered on the slide without animation properties. <i>end note</i>]</p> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| tm (Time) | <p>This attribute specifies the time at which the attribute being animated takes on the value.</p> <p>The possible values for this attribute are defined by the ST_TLTimeAnimateValueTime</p> |

| Attributes | Description |
|------------|-------------------------|
| | simple type (§19.7.39). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeAnimateValue](#)) is located in §A.3. *end note*]

19.5.80 **tavLst (Time Animated Value List)**

This element specifies a list of time animated value elements.

[Example: Consider a shape with a "fly-in" animation. The <tav> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> ... </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="1+#ppt_h/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100000">
      <p:val>
        <p:strVal val="#ppt_y"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

end example]

| Parent Elements |
|-----------------|
| anim (§19.5.1) |

| Child Elements | Subclause |
|--------------------------|-----------|
| tav (Time Animate Value) | §19.5.79 |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLTimeAnimateValueList](#)) is located in §A.3. *end note*]

19.5.81 **tgtEl (Target Element)**

This element specifies the target children elements which have the animation effects applied to.

[*Example:* Consider a shape with ID 3 with a fade effect animation applied to it. The <tgtEl> element should be used as follows:

```
<p:animEffect transition="in" filter="fade">
  <p:cBhvr>
    <p:cTn id="7" dur="2000"/>
    <p:tgtEl>
      <p:spTgt spid="3"/>
    </p:tgtEl>
  </p:cBhvr>
</p:animEffect>
```

end example]

| Parent Elements |
|--|
| cBhvr (§19.5.22); cMediaNode (§19.5.29); cond (§19.5.31); endSync (§19.5.39) |

| Child Elements | Subclause |
|-----------------------|-----------|
| inkTgt (Ink Target) | §19.5.47 |
| sldTgt (Slide Target) | §19.5.67 |
| sndTgt (Sound Target) | §19.5.70 |
| spTgt (Shape Target) | §19.5.72 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLTimeTargetElement](#)) is located in §A.3. *end note]*

19.5.82 **tmAbs (Time Absolute)**

This element describes the duration of the iteration interval in absolute time.

[*Example:* Consider a text animation where the words appear letter by letter every 10 seconds. The <tmAbs> element should be used as follows:

```
<p:par>
  <p:cTn id="5" >
    <p:stCondLst> ... </p:stCondLst>
    <p:iterate type="lt">
      <p:tmAbs val="10000"/>
    </p:iterate>
```

```

    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>

```

end example]

| Parent Elements |
|--------------------|
| iterate (§19.5.49) |

| Attributes | Description |
|------------|--|
| val (Time) | <p>This attribute describes an amount of time, in milliseconds.</p> <p>The possible values for this attribute are defined by the ST_TLTime simple type (§19.7.38).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLiterateIntervalTime](#)) is located in §A.3. *end note*]

19.5.83 tmPct (Time Percentage)

This element describes the duration of the iteration interval in a percentage of time.

[Example: Consider a text animation where the words appear letter by letter every 10th of the animation duration. The <tmPct> element should be used as follows:

```

<p:par>
  <p:cTn id="5" >
    <p:stCondLst> ... </p:stCondLst>
    <p:iterate type="lt">
      <p:tmPct val="10%"/>
    </p:iterate>
    <p:childTnLst> ... </p:childTnLst>
  </p:cTn>
</p:par>

```

end example]

| Parent Elements |
|--------------------|
| iterate (§19.5.49) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>This attribute specifies the time expressed as a percentage.</p> <p>The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLIterateIntervalPercentage](#)) is located in §A.3. *end note*]

19.5.84 **tmpl (Template Effects)**

This element specifies the "template" effects that are used by the build element. Template effects are used in text builds on the master slide. They define the rules of what effect should be applied to the 1st level paragraph, 2nd level paragraph, etc.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> ... </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
          </p:tmpl>
        </p:tmplLst>
      </p:bldP>
    </p:bldLst>
  </p:timing>
```

end example]

| Parent Elements |
|--------------------|
| tmplLst (§19.5.85) |

| Child Elements | Subclause |
|------------------------|-----------|
| tnLst (Time Node List) | §19.5.87 |

| Attributes | Description |
|-------------|---|
| lvl (Level) | <p>This attribute describes the paragraph indent level to which this template effect applies.</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTemplate](#)) is located in §A.3. *end note*]

19.5.85 **tmplLst (Template effects)**

This element describes a list of template effects that describe what kind of effects should be applied to a paragraph level properties.

[Example: Consider a template with a fade in effect applied to it. The <tmpl> element should be used as follows:

```
<p:timing>
  <p:tnLst> ... </p:tnLst>
  <p:bldLst>
    <p:bldP spid="3" grpId="0" build="p">
      <p:tmplLst>
        <p:tmpl lvl="1">
          </p:tmpl>
        </p:tmplLst>
      </p:bldP>
    </p:bldLst>
  </p:timing>
```

end example]

| Parent Elements |
|-----------------|
| bldP (§19.5.16) |

| Child Elements | Subclause |
|-------------------------|-----------|
| tmpl (Template Effects) | §19.5.84 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTemplateList](#)) is located in §A.3. *end note*]

19.5.86 **tn (Time Node)**

This element describes the time node trigger choice.

[Example: Consider a time node with an event condition. The <tn> element should be used as follows:

```
<p:par>
  <p:cTn id="5">
    <p:stCondLst>
      <p:cond delay="0"/>
```

```
</p:stCondLst>
<p:endCondLst>
  <p:cond evt="begin" delay="0">
    <p:tn val="5"/>
  </p:cond>
</p:endCondLst>
<p:childTnLst> ... </p:childTnLst>
</p:cTn>
</p:par>
```

end example]

| Parent Elements |
|-------------------------------------|
| cond (§19.5.31); endSync (§19.5.39) |

| Attributes | Description |
|-------------|---|
| val (Value) | This attribute specifies a time node identifier. The possible values for this attribute are defined by the ST_TLTimeNodeID simple type (§19.7.42). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLTriggerTimeNodeID](#)) is located in §A.3. *end note*]

19.5.87 tnLst (Time Node List)

This element specifies a list of time node elements used in an animation sequence.

[*Example:* Consider a simple animation sequence. The <tnLst> element should be used as follows:

```
<p:timing>
  <p:tnLst>
    <p:par> ... </p:par>
  </p:tnLst>
</p:timing>
```

end example]

| Parent Elements |
|--------------------------------------|
| timing (§19.3.1.48); tmpl (§19.5.84) |

| Child Elements | Subclause |
|----------------------------------|-----------|
| anim (Animate) | §19.5.1 |
| animClr (Animate Color Behavior) | §19.5.2 |
| animEffect (Animate Effect) | §19.5.3 |
| animMotion (Animate Motion) | §19.5.4 |
| animRot (Animate Rotation) | §19.5.5 |
| animScale (Animate Scale) | §19.5.6 |
| audio (Audio) | §19.5.9 |
| cmd (Command) | §19.5.28 |
| excl (Exclusive) | §19.5.40 |
| par (Parallel Time Node) | §19.5.53 |
| seq (Sequence Time Node) | §19.5.65 |
| set (Set Time Node Behavior) | §19.5.66 |
| video (Video) | §19.5.93 |

[Note: The W3C XML Schema definition of this element's content model ([CT TimeNodeList](#)) is located in §A.3.
end note]

19.5.88 to (To)

This element specifies the target location for an animation motion or animation scale effect

[Example: Consider an animation with a "light speed" entrance effect.

```
<p:animScale>
  <p:cBhvr>
    <p:cTn id="9" dur="200" decel="10.5%" autoRev="1" fill="hold">
      <p:stCondLst>
        <p:cond delay="600"/>
      </p:stCondLst>
    </p:cTn>
    <p:tgtEl>
      <p:spTgt spid="4"/>
    </p:tgtEl>
  </p:cBhvr>
  <p:from x="100%" y="100%"/>
  <p:to x="80%" y="100%"/>
</p:animScale>
```

end example]

| Parent Elements |
|---|
| animMotion (§19.5.4); animScale (§19.5.6) |

| Attributes | Description |
|------------------|--|
| x (X coordinate) | This attribute describes the X coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| y (Y coordinate) | This attribute describes the Y coordinate. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TLPoint](#)) is located in §A.3. *end note*]

19.5.89 to (To)

The element specifies the certain attribute of a time node after an animation effect.

[Example: Consider an animation effect that leaves a string value visible afterwards. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:set>
    <p:cBhvr> ... </p:cBhvr>
    <p:to>
      <p:strVal val="visible"/>
    </p:to>
  </p:set>
  <p:anim calcmode="lin" valueType="num"> ... </p:anim>
</p:childTnLst>
```

end example]

| Parent Elements |
|-----------------|
| set (§19.5.66) |

| Child Elements | Subclause |
|---------------------------|-----------|
| boolVal (Boolean Variant) | §19.5.19 |

| Child Elements | Subclause |
|-----------------------|-----------|
| clrVal (Color Value) | §19.5.27 |
| fltVal (Float Value) | §19.5.42 |
| intVal (Integer) | §19.5.48 |
| strVal (String Value) | §19.5.75 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TLAnimVariant](#)) is located in §A.3. *end note*]

19.5.90 to (To)

This element specifies the resulting color for the animation color change.

[*Example*: Consider emphasize a shape by changing its fill color from blue to red. The <to> element should be used as follows:

```
<p:childTnLst>
  <p:animClr clrSpc="rgb">
    <p:cBhvr> ... </p:cBhvr>
    <p:to>
      <a:schemeClr val="accent2"/>
    </p:to>
  </p:animClr>
</p:childTnLst>
```

end example]

| Parent Elements |
|-------------------|
| animClr (§19.5.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

19.5.91 txEl (Text Element)

This element specifies a text element to animate.

[Example: Consider a shape containing text to be animated. The <txEl> should be used as follows:

```
<p:tgtEl>
  <p:spTgt spid="5">
    <p:txEl>
      <p:pRg st="1" end="1"/>
    </p:txEl>
  </p:spTgt>
</p:tgtEl>
```

end example]

| Parent Elements |
|------------------|
| spTgt (§19.5.72) |

| Child Elements | Subclause |
|----------------------------|-----------|
| charRg (Character Range) | §19.5.23 |
| pRg (Paragraph Text Range) | §19.5.56 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TLTextTargetElement](#)) is located in §A.3. *end note]*

19.5.92 val (Value)

The element specifies a value for a time animate.

[Example: Consider a shape with a fade in animation effect. The <val> element should be used as follows:

```
<p:anim calcmode="lin" valueType="num">
  <p:cBhvr additive="base"> ... </p:cBhvr>
  <p:tavLst>
    <p:tav tm="0%">
      <p:val>
        <p:strVal val="0-#ppt_w/2"/>
      </p:val>
    </p:tav>
    <p:tav tm="100%">
      <p:val>
        <p:strVal val="#ppt_x"/>
      </p:val>
    </p:tav>
  </p:tavLst>
</p:anim>
```

```
        </p:tav>
    </p:tavLst>
</p:anim>
```

end example]

| Parent Elements |
|-----------------|
| tav (§19.5.79) |

| Child Elements | Subclause |
|---------------------------|-----------|
| boolVal (Boolean Variant) | §19.5.19 |
| clrVal (Color Value) | §19.5.27 |
| fltVal (Float Value) | §19.5.42 |
| intVal (Integer) | §19.5.48 |
| strVal (String Value) | §19.5.75 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLAnimVariant](#)) is located in §A.3.
end note]

19.5.93 video (Video)

This element specifies video information in an animation sequence. This element specifies that this node within the animation tree triggers the playback of a video file; the actual video file used is specified by the videoFile element (§20.1.3.6).

[*Example:* Consider a slide with an animated video content. The <video> element is used as follows:

```
<p:cSld>
  <p:spTree>
    <p:pic>
      <p:nvPicPr>
        <p:cNvPr id="4"/>
        ...
        <p:nvPr>
          <a:videoFile r:link="rId1" contentType="video/ogg"/>
        </p:nvPr>
      </p:nvPicPr>
      ...
    </p:pic>
  </p:spTree>
</p:cSld>
...
```

```
<p:childTnLst>
  <p:seq concurrent="1" nextAc="seek">
    ...
  </p:seq>
  <p:video>
    <p:cMediaNode>
      ...
      <p:tgtEl>
        <p:spTgt spid="4"/>
      </p:tgtEl>
    </p:cMediaNode>
  </p:video>
</p:childTnLst>
```

The video element specifies the location of the video playback within the animation sequence; its child spTgt element specifies that the shape which contains the video to be played has a shape ID of 4. If we look at the shape with that ID value, its child videoFile element references an external video file of content type video/ogg located at the target of the relationship with ID rId1.*end example*]

| Parent Elements |
|--|
| childTnLst (§19.5.25); subTnLst (§19.5.78); tnLst (§19.5.87) |

| Child Elements | Subclause |
|---|-----------|
| cMediaNode (Common Media Node Properties) | §19.5.29 |

| Attributes | Description |
|-----------------------|---|
| fullScr (Full Screen) | <p>This attribute specifies if the video is displayed in full-screen.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

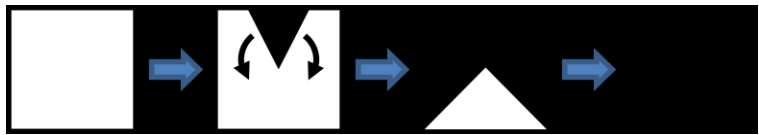

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TLMediaNodeVideo](#)) is located in §A.3. *end note*]

19.5.94 wedge (Wedge Slide Transition)

This element describes the wedge slide transition effect, which uses two radial edges that wipe from top to bottom in opposite directions until the new slide is fully shown. The rendering of this transition has been shown below.

[*Example:* Consider the following case in which the “wedge” slide transition is applied to a slide, along with a set of attributes. The proper usage and a sample rendering are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wedge/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Empty](#)) is located in §A.3. *end note]*

19.5.95 wheel (Wheel Slide Transition)

This element describes the wheel slide transition effect, which uses a set of radial edges and wipes them in the clockwise direction until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “wheel” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wheel spokes="1"/>
</p:transition>
```

```
<p:transition>
  <p:wheel spokes="2"/>
```

</p:transition>

<p:transition>
 <p:wheel spokes="3"/>
</p:transition>

<p:transition>
 <p:wheel spokes="4"/>
</p:transition>

<p:transition>
 <p:wheel spokes="8"/>
</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|--|
| spokes (Spokes) | This attributes specifies the number of spokes ("pie pieces") in the wheel The possible values for this attribute are defined by the W3C XML Schema unsignedInt |

| Attributes | Description |
|------------|-------------|
| | datatype. |

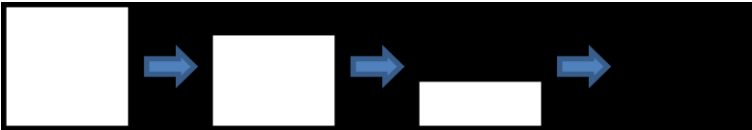

[Note: The W3C XML Schema definition of this element’s content model ([CT_WheelTransition](#)) is located in §A.3.
end note]

19.5.96 wipe (Wipe Slide Transition)

This element describes the wipe slide transition effect, which wipes the new slide over the previous slide from one edge of the screen to the opposite until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[Example: Consider the following cases in which the “wipe” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

```
<p:transition>
  <p:wipe dir="d"/>
</p:transition>
```

```
<p:transition>
  <p:wipe dir="l"/>
</p:transition>
```

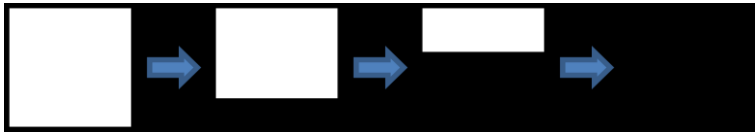

```
<p:transition>
  <p:wipe dir="r"/>
</p:transition>
```

```
<p:transition>
  <p:wipe dir="u"/>
```

</p:transition>

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|---|
| dir (Direction) | This attribute specifies the direction of the slide transition. The possible values for this attribute are defined by the ST_TransitionSideDirectionType simple type (§19.7.53). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_SideDirectionTransition](#)) is located in §A.3. *end note]*

19.5.97 zoom (Zoom Slide Transition)

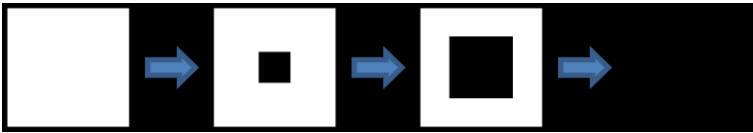

This element describes the zoom slide transition effect, which uses a box pattern centered on the slide that increases in size until the new slide is fully shown. The rendering of this transition depends upon the attributes specified which have been shown below.

[*Example:* Consider the following cases in which the “zoom” slide transition is applied to a slide, along with a set of attributes. The proper usage and sample renderings are shown below, with the XML fragments preceding the corresponding rendering:

<p:transition>
 <p:zoom dir="in"/>
</p:transition>

```
<p:transition>
  <p:zoom dir="out"/>
</p:transition>
```

end example]

[*Note:* Any rendering shown above is for example purposes only. Exact rendering of any transition is determined by the rendering application. As such, the same transition can have many variations depending on the implementation. *end note]*

| Parent Elements |
|-------------------------|
| transition (§19.3.1.50) |

| Attributes | Description |
|-----------------|--|
| dir (Direction) | This attribute specifies the direction of an "in/out" slide transition. The possible values for this attribute are defined by the ST_TransitionInOutDirectionType simple type (§19.7.52). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_InOutTransition](#)) is located in §A.3. *end note]*

19.6 Slide Synchronization Data

It is often the case that slides are repurposed from existing presentations to be used in other presentations. In such cases, it is often beneficial for there to be an association, or a pairing, between the original slide and all copied instances of it. In the presence of such a pairing, applications can enable a variety of time-saving features, including the automatic updates of copied slides when the original slide changes. The Slide Synchronization Data part is designed to enable such application-defined functionality.

This information is stored in the Slide Synchronization Data part, which is referenced via an implicit relationship from the associated Slide part.

19.6.1 sldSyncPr (Slide Synchronization Properties)

This element specifies the information needed to associate the original slide with all copied instances of it.

| Parent Elements |
|--|
| Root element of PresentationML Slide Synchronization Data part |

| Child Elements | Subclause |
|-------------------------|------------|
| extLst (Extension List) | §19.2.1.12 |

| Attributes | Description |
|--|---|
| clientInsertedTime (Client Slide Insertion date/time) | <p>The date and time that the original slide was last updated in the current presentation.</p> <p>The date/time is stored in ISO 8601 format.</p> <p>[<i>Note</i>: This value can be used to inform the user of when the last synchronization was, as well as to determine when to next check for an updated version. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p> |
| serverSldId (Server's Slide File ID) | <p>A string that, when paired with the target of the Slide Synchronization Data part's external relationship, uniquely identifies the original slide.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| serverSldModified Time (Server's Slide File's modification date/time) | <p>The date and time that the original slide was last modified in its location as defined by the target of the Slide Synchronization Data part's external relationship.</p> <p>The date and time are stored in ISO 8601 format.</p> <p>The possible values for this attribute are defined by the W3C XML Schema dateTime datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_SlideSyncProperties](#)) is located in §A.3. *end note*]

19.7 Simple Types

This is the complete list of simple types dedicated to PresentationML.

19.7.1 ST_BookmarkIdSeed (Bookmark ID Seed)

This simple type specifies constraints for value of the Bookmark ID seed.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 1.
- This simple type has a maximum value of less than 2147483648.

| Referenced By |
|--|
| presentation@bookmarkIdSeed (§19.2.1.26) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_BookmarkIdSeed](#)) is located in §A.3. *end note*]

19.7.2 ST_Direction (Direction)

This simple type defines a direction of either horizontal or vertical.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---------------------------------|
| horz (Horizontal) | Defines a horizontal direction. |
| vert (Vertical) | Defines a vertical direction. |

| Referenced By |
|---|
| blinds@dir (§19.5.18); checker@dir (§19.5.24); comb@dir (§19.5.30); guide@orient (§19.2.2.4); ph@orient (§19.3.1.36); randomBar@dir (§19.5.61); split@orient (§19.5.71) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Direction](#)) is located in §A.3. *end note*]

19.7.3 ST_Index (Index)

This simple type defines the position of an object in an ordered list.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|---|
| charRg@end (§19.5.23); charRg@st (§19.5.23); cm@idx (§19.4.1); pRg@end (§19.5.56); pRg@st (§19.5.56); sldRg@end (§19.2.1.38); sldRg@st (§19.2.1.38) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_Index](#)) is located in §A.3. *end note*]

19.7.4 ST_IterateType (Iterate Type)

This simple type specifies how the animation is applied over subelements of the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---------------------|
| el (Element) | Iterate by element. |
| lt (Letter) | Iterate by Letter. |
| wd (Word) | Iterate by Word. |

| Referenced By |
|-------------------------|
| iterate@type (§19.5.49) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_IterateType](#)) is located in §A.3. *end note*]

19.7.5 ST_Name (Name string)

This simple type specifies a name, such as for a comment author or custom show.

This simple type's contents are a restriction of the W3C XML Schema string datatype.

| Referenced By |
|---|
| cmAuthor@initials (§19.4.2); cmAuthor@name (§19.4.2); custShow@name (§19.2.1.6) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Name](#)) is located in §A.3. *end note*]

19.7.6 ST_OleObjectFollowColorScheme (Embedded object to Follow Color Scheme)

This simple type determines if the Embedded object is re-colored to reflect changes to the color schemes.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| full (Full) | Setting this enumeration causes the Embedded object to respond to all changes in the color scheme in the presentation. |

| Enumeration Value | Description |
|---|---|
| none (None) | Setting this enumeration causes the Embedded object to not respond to changes in the color scheme in the presentation. |
| textAndBackground (Text and Background) | Setting this enumeration causes the Embedded object to respond only to changes in the text and background colors of the color scheme in the presentation. |

| Referenced By |
|-------------------------------------|
| embed@followColorScheme (§19.3.2.2) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_OleObjectFollowColorScheme](#)) is located in §A.3. *end note*]

19.7.7 ST_PhotoAlbumFrameShape (Photo Album Shape for Photo Mask)

This simple type specifies the values for photo frame types within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| frameStyle1 (Rectangle Photo Frame) |  |
| frameStyle2 (Rounded Rectangle Photo Frame) |  |
| frameStyle3 (Simple White Photo Frame) |  |
| frameStyle4 (Simple Black Photo Frame) |  |
| frameStyle5 (Compound Black Photo Frame) |  |

| Enumeration Value | Description |
|---|---|
| frameStyle6 (Center Shadow Photo Frame) |  |
| frameStyle7 (Soft Edge Photo Frame) |  |

| Referenced By |
|-------------------------------|
| photoAlbum@frame (§19.2.1.24) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PhotoAlbumFrameShape](#)) is located in §A.3. *end note*]

19.7.8 ST_PhotoAlbumLayout (Photo Album Layout Definition)

This simple type specifies the values for photo layouts within a photo album presentation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| 1pic (1 Photo per Slide) |  <p>Specifies that photo album slides should have a single picture, centered horizontally and vertically, on the slide with no title.</p> |
| 1picTitle (1 Photo per Slide with Titles) |  <p>Specifies that photo album slides should have a single picture and a single title text box, centered horizontally and vertically, on the slide.</p> |
| 2pic (2 Photos per Slide) |  <p>Specifies that photo album slides should have two pictures of the same size, positioned side-by-side,</p> |

| Enumeration Value | Description |
|--|---|
| | centered horizontally and vertically, on the slide with no title. |
| 2picTitle (2 Photos per Slide with Titles) |  <p>Specifies that photo album slides should have two pictures of the same size, positioned side-by-side, with a single title text box centered over them, collectively centered horizontally and vertically, on the slide.</p> |
| 4pic (4 Photos per Slide) |  <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, centered horizontally and vertically, on the slide with no title.</p> |
| 4picTitle (4 Photos per Slide with Titles) |  <p>Specifies that photo album slides should have four pictures of the same size, positioned in a two-by-two matrix, with a single title text box centered over the matrix, centered horizontally and vertically, on the slide.</p> |
| fitToSlide (Fit Photos to Slide) |  <p>Specifies that photo album slides should have a single picture, stretched to fit the entire slide size, with no title.</p> |

| Referenced By |
|--------------------------------|
| photoAlbum@layout (§19.2.1.24) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST PhotoAlbumLayout](#)) is located in §A.3. *end note*]

19.7.9 ST_PlaceholderSize (Placeholder Size)

This simple type facilitates the storing of the size of the placeholder. This size is described relative to the body placeholder on the master.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| full (Full) | Specifies that the placeholder should take the full size of the body placeholder on the master. |
| half (Half) | Specifies that the placeholder should take the half size of the body placeholder on the master. Half size vertically or horizontally? Needs a picture. |
| quarter (Quarter) | Specifies that the placeholder should take a quarter of the size of the body placeholder on the master. Picture would be helpful |

| Referenced By |
|--------------------|
| ph@sz (§19.3.1.36) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_PlaceholderSize](#)) is located in §A.3. *end note*]

19.7.10 ST_PlaceholderType (Placeholder IDs)

This simple type facilitates the storing of the content type a placeholder should contain.

[*Note*: Some placeholder types are not allowed for all SlideBase types. *end note*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|--|
| body (Body) | Contains body text. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master. Can be horizontal or vertical on Slide and Slide Layout. |
| chart (Chart) | Contains a chart or graph. Special type. Allowed for Slide and Slide Layout. |
| clipArt (Clip Art) | Contains a single clip art image. Special type. Allowed for Slide and Slide Layout. |
| ctrTitle (Centered Title) | Contains a title intended to be centered on the slide. |

| Enumeration Value | Description |
|-----------------------|--|
| | Allowed for Slide and Slide Layout. |
| dgm (Diagram) | Contains a diagram. Special type. Allowed for Slide and Slide Layout. |
| dt (Date and Time) | Contains the date and time. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master |
| fttr (Footer) | Contains text to be used as a footer in the document. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master |
| hdr (Header) | Contains text to be used as a header for the document. Allowed for Notes, Notes Master, Handout Master . |
| media (Media) | Contains multimedia content such as audio or a movie clip. Special type. Allowed for Slide and Slide Layout. |
| obj (Object) | Contains any content type. Special type. Allowed for Slide and Slide Layout. |
| pic (Picture) | Contains a picture. Special type. Allowed for Slide and Slide Layout. |
| sldImg (Slide Image) | Contains an image of the slide. Allowed for Notes and Notes Master. |
| sldNum (Slide Number) | Contains the number of a slide. Allowed for Slide, Slide Layout, Slide Master, Notes, Notes Master, Handout Master |
| subTitle (Subtitle) | Contains a subtitle. Allowed for Slide and Slide Layout. |
| tbl (Table) | Contains a table. Special type. Allowed for Slide and Slide Layout. |
| title (Title) | Contains a slide title. Allowed for Slide, Slide Layout and Slide Master. Can be horizontal or vertical on Slide and Slide Layout. |

| Referenced By |
|----------------------|
| ph@type (§19.3.1.36) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PlaceholderType](#)) is located in §A.3. *end note*]

19.7.11 ST_PrintColorMode (Print Color Mode)

This simple type specifies the color mode that should be used when printing a presentation document.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------|---|
| bw (Black and White Mode) | Print should be in Black and White only |
| clr (Color Mode) | Print should be in Full Color |
| gray (Grayscale Mode) | Print should be in Grayscale only |

| Referenced By |
|----------------------------|
| prnPr@clrMode (§19.2.1.28) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintColorMode](#)) is located in §A.3. *end note*]

19.7.12 ST_PrintWhat (Default print output)

This simple type specifies the default print layout that should be used when printing

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|--|
| handouts1 (1 Slide / Handout Page) | 1 Slide and Handout Page layout should be used. |
| handouts2 (2 Slides / Handout Page) | 2 Slides and Handout Page layout should be used. |
| handouts3 (3 Slides / Handout Page) | 3 Slides and Handout Page layout should be used. |
| handouts4 (4 Slides / Handout Page) | 4 Slides and Handout Page layout should be used. |
| handouts6 (6 Slides / Handout Page) | 6 Slides and Handout Page layout should be used. |
| handouts9 (9 Slides / Handout Page) | 9 Slides and Handout Page layout should be used. |
| notes (Notes) | Notes layout should be used. |
| outline (Outline) | Outline layout should be used. |
| slides (Slides) | Slides layout should be used. |

| Referenced By |
|----------------------------|
| prnPr@prnWhat (§19.2.1.28) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PrintWhat](#)) is located in §A.3. *end note*]

19.7.13 ST_SlideId (Slide Identifier)

This simple type specifies the allowed numbering for the slide identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than 2147483648.
- This simple type has a minimum value of greater than or equal to 256.

| Referenced By |
|-----------------------|
| sldId@id (§19.2.1.33) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideId](#)) is located in §A.3. *end note*]

19.7.14 ST_SlideLayoutId (Slide Layout ID)

This simple type sets the bounds for the slide layout id value. This layout id is used to identify the different slide layout designs.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

| Referenced By |
|-----------------------------|
| sldLayoutId@id (§19.3.1.40) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideLayoutId](#)) is located in §A.3. *end note*]

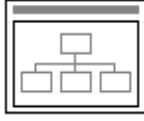

19.7.15 ST_SlideLayoutType (Slide Layout Type)

This simple type defines an arrangement of content on a slide. Each layout type is not tied to an exact positioning of placeholders, but rather provides a higher-level description of the content type and positioning of placeholders. This information can be used by the application to aid in mapping between different layouts. The application can choose which, if any, of these layouts to make available through its user interface.

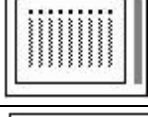

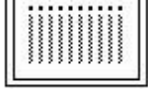

Each layout contains zero or more placeholders, each with a specific content type. An "object" placeholder can contain any kind of data. Media placeholders are intended to hold video or audio clips. The enumeration value descriptions include illustrations of sample layouts for each value of the simple type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| blank (Slide Layout Type Enumeration (Blank)) |  Blank |
| chart (Chart) |  Title and chart |
| chartAndTx (Slide Layout Type Enumeration (Chart and Text)) |  Title, chart on left and text on right |
| clipArtAndTx (Clip Art and Text) |  Title, clipart on left, text on right |
| clipArtAndVertTx (Clip Art and Vertical Text) |  Title, clip art on left, vertical text on right |
| cust (Slide Layout Type Enumeration (Custom)) | Custom layout defined by user |
| dgm (Slide Layout Type Enumeration (Diagram)) |  Title and diagram |
| fourObj (Four Objects) |  Title and four objects |
| mediaAndTx (Slide Layout Type Enumeration (Media and Text)) |  Title, media on left, text on right |
| obj (Title and Object) |  Title and object |
| objAndTwoObj (Object and Two Object) |  Title, one object on left, two objects on right |
| objAndTx (Slide Layout Type Enumeration (Object and Text)) |  Title, object on left, text on right |
| objOnly (Object) | Object only |

| Enumeration Value | Description | |
|---|---|--|
| |  | |
| objOverTx (Slide Layout Type Enumeration (Object over Text)) |  | Title, object on top, text on bottom |
| objTx (Title, Object, and Caption) |  | Title, object and caption text |
| picTx (Picture and Caption) |  | Title, picture, and caption text |
| secHead (Section Header) |  | Section header title and subtitle text |
| tbl (Slide Layout Type Enumeration (Table)) |  | Title and table |
| title (Slide Layout Type Enumeration (Title)) |  | Title layout with centered title and subtitle placeholders |
| titleOnly (Slide Layout Type Enumeration (Title Only)) |  | Title only |
| twoColTx (Slide Layout Type Enumeration (Two Column Text)) |  | Title, text on left, text on right |
| twoObj (Two Objects) |  | Title, object on left, object on right |
| twoObjAndObj (Two Objects and Object) |  | Title, two objects on left, one object on right |
| twoObjAndTx (Two Objects and Text) |  | Title, two objects on left, text on right |

| Enumeration Value | Description |
|---|--|
| twoObjOverTx (Two Objects over Text) |  Title, two objects on top, text on bottom |
| twoTxTwoObj (Two Text and Two Objects) |  Title, two objects each with text |
| tx (Slide Layout Type Enumeration (Text)) |  Title and text |
| txAndChart (Slide Layout Type Enumeration (Text and Chart)) |  Title, text on left and chart on right |
| txAndClipArt (Text and Clip Art) |  Title, text on left, clip art on right |
| txAndMedia (Slide Layout Type Enumeration (Text and Media)) |  Title, text on left, media on right |
| txAndObj (Slide Layout Type Enumeration (Text and Object)) |  Title, text on left, object on right |
| txAndTwoObj (Text and Two Objects) |  Title, text on left, two objects on right |
| txOverObj (Slide Layout Type Enumeration (Text over Object)) |  Title, text on top, object on bottom |
| vertTitleAndTx (Vertical Title and Text) |  Vertical title on right, vertical text on left |
| vertTitleAndTxOverChart (Vertical Title and Text Over Chart) |  Vertical title on right, vertical text on top, chart on bottom |
| vertTx (Vertical Text) |  Title and vertical text body |

| Referenced By |
|-----------------------------|
| sldLayout@type (§19.3.1.39) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideLayoutType](#)) is located in §A.3. *end note*]

19.7.16 ST_SlideMasterId (Slide Master ID)

This simple type specifies the allowed numbering for the slide master identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 2147483648.

| Referenced By |
|-----------------------------|
| sldMasterId@id (§19.2.1.36) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideMasterId](#)) is located in §A.3. *end note*]

19.7.17 ST_SlideSizeCoordinate (Slide Size Coordinate)

This simple type specifies the slide size coordinate in EMUs (English Metric Units).

This simple type's contents are a restriction of the ST_PositiveCoordinate32 datatype (§20.1.10.42).

This simple type also specifies the following restrictions:

- This simple type has a maximum value of less than or equal to 51206400.
- This simple type has a minimum value of greater than or equal to 914400.

| Referenced By |
|--|
| sldSz@cx (§19.2.1.39); sldSz@cy (§19.2.1.39) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideSizeCoordinate](#)) is located in §A.3. *end note*]

19.7.18 ST_SlideSizeType (Slide Size Type)

This simple type specifies the kind of slide size that the slide should be optimized for.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|--|
| 35mm (35mm Film) | Slide size should be optimized for 35mm film output |
| A3 (A3) | Slide size should be optimized for A3 output |
| A4 (A4) | Slide size should be optimized for A4 output |
| B4ISO (B4ISO) | Slide size should be optimized for B4ISO output |
| B4JIS (B4JIS) | Slide size should be optimized for B4JIS output |
| B5ISO (B5ISO) | Slide size should be optimized for B5ISO output |
| B5JIS (B5JIS) | Slide size should be optimized for B5JIS output |
| banner (Banner) | Slide size should be optimized for banner output |
| custom (Custom) | Slide size should be optimized for custom output |
| hagakiCard (Hagaki Card) | Slide size should be optimized for hagaki card output |
| ledger (Ledger) | Slide size should be optimized for ledger output |
| letter (Letter) | Slide size should be optimized for letter output |
| overhead (Overhead) | Slide size should be optimized for overhead output |
| screen16x10 (Screen 16x10) | Slide size should be optimized for 16x10 screen output |
| screen16x9 (Screen 16x9) | Slide size should be optimized for 16x9 screen output |
| screen4x3 (Screen 4x3) | Slide size should be optimized for 4x3 screen output |

| Referenced By |

| sldSz@type (§19.2.1.39) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SlideSizeType](#)) is located in §A.3. end note]

19.7.19 ST_SplitterBarState (Splitter Bar State)

This simple type specifies the state that the splitter bar should be shown in. The splitter bar separates a primary and secondary region within a viewing area.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---|
| maximized (Max) | The primary region occupies the greatest amount of the viewing area allowed by the application. |
| minimized (Min) | The primary region occupies the least amount of the viewing area allowed by the application. |

| Enumeration Value | Description |
|---------------------|--|
| restored (Restored) | The primary region has a specific intermediate size. |

| Referenced By |
|--|
| normalViewPr@horzBarState (§19.2.2.6); normalViewPr@vertBarState (§19.2.2.6) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_SplitterBarState](#)) is located in §A.3. *end note*]

19.7.20 ST_TLAnimateBehaviorCalcMode (Time List Animate Behavior Calculate Mode)

This simple type specifies how the animation flows from point to point.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|-------------|
| discrete (Calc Mode Enum (Discrete)) | Discrete |
| fm1a (Calc Mode Enum (Formula)) | Formula |
| lin (Calc Mode Enum (Linear)) | Linear |

| Referenced By |
|-------------------------|
| anim@calcmode (§19.5.1) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateBehaviorCalcMode](#)) is located in §A.3. *end note*]

19.7.21 ST_TLAnimateBehaviorValueType (Time List Animate Behavior Value Types)

This simple type specifies the type of property value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------------|-------------|
| clr (Value Type Enum (Color)) | Color |
| num (Value Type Enum (Number)) | Number |

| Enumeration Value | Description |
|----------------------------------|-------------|
| str (Value Type Enum (String)) | String |

| Referenced By |
|--------------------------|
| anim@valueType (§19.5.1) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateBehaviorValueType](#)) is located in §A.3. *end note*]

19.7.22 ST_TLAnimateColorDirection (Time List Animate Color Direction)

This simple type specifies the direction in which to interpolate the animation (clockwise or counterclockwise).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------------|-------------------|
| ccw (Counter-Clockwise) | Counter-Clockwise |
| cw (Direction Enum (Clockwise)) | Clockwise |

| Referenced By |
|-----------------------|
| animClr@dir (§19.5.2) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateColorDirection](#)) is located in §A.3. *end note*]

19.7.23 ST_TLAnimateColorSpace (Time List Animate Color Space)

This simple type specifies the color space of the animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|----------------------------|
| hsl (Color Space Enum (HSL)) | Hue, Saturation, Luminance |
| rgb (Color Space Enum (RGB)) | Red, Green, Blue |

| Referenced By |
|--------------------------|
| animClr@clrSpc (§19.5.2) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateColorSpace](#)) is located in §A.3. *end note*]

19.7.24 ST_TLAnimateEffectTransition (Time List Animate Effect Transition)

This simple type specifies whether the effect is a transition in, transition out, or neither.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|-------------|
| in (Transition Enum (In)) | In |
| none (Transition Enum (None)) | None |
| out (Transition Enum (Out)) | Out |

| Referenced By |
|---------------------------------|
| animEffect@transition (§19.5.3) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateEffectTransition](#)) is located in §A.3. *end note*]

19.7.25 ST_TLAnimateMotionBehaviorOrigin (Time List Animate Motion Behavior Origin)

This simple type specifies what the origin of the motion path is relative to.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------|-------------|
| layout (Origin Enum (Layout)) | Layout |
| parent (Origin Enum (Parent)) | Parent |

| Referenced By |
|-----------------------------|
| animMotion@origin (§19.5.4) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLAnimateMotionBehaviorOrigin](#)) is located in §A.3. *end note*]

19.7.26 ST_TLAnimateMotionPathEditMode (Time List Animate Motion Path Edit Mode)

This simple type specifies how the motion path moves when the target element is moved.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------|
| fixed (Path Edit Mode Enum (Fixed)) | Fixed |
| relative (Path Edit Mode Enum (Relative)) | Relative |

| Referenced By |
|-----------------------------------|
| animMotion@pathEditMode (§19.5.4) |

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLAnimateMotionPathEditMode) is located in §A.3. *end note*]

19.7.27 ST_TLBehaviorAccumulateType (Behavior Accumulate Type)

This simple type makes a repeating animation build with each iteration when set to "always."

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|-------------|
| always (Accumulate Enum (Always)) | Always |
| none (Accumulate Enum (None)) | None |

| Referenced By |
|-----------------------------|
| cBhvr@accumulate (§19.5.22) |

[*Note*: The W3C XML Schema definition of this simple type's content model (ST_TLBehaviorAccumulateType) is located in §A.3. *end note*]

19.7.28 ST_TLBehaviorAdditiveType (Behavior Additive Type)

This simple type specifies how to apply the animation values to the original value for the property.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------------|-------------|
| base (Additive Enum (Base)) | Base |
| mult (Additive Enum (Multiply)) | Multiply |
| none (None) | None |
| repl (Additive Enum (Replace)) | Replace |
| sum (Additive Enum (Sum)) | Sum |

| Referenced By |
|---------------------------|
| cBhvr@additive (§19.5.22) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorAdditiveType](#)) is located in §A.3. *end note*]

19.7.29 ST_TLBehaviorOverrideType (Behavior Override Type)

This simple type specifies how a behavior should override values of the attribute being animated on the target element. The "childStyle" clears the attributes on the children contained inside the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|-------------|
| childStyle (Override Enum (Child Style)) | Child Style |
| normal (Override Enum (Normal)) | Normal |

| Referenced By |
|---------------------------|
| cBhvr@override (§19.5.22) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorOverrideType](#)) is located in §A.3. *end note*]

19.7.30 ST_TLBehaviorTransformType (Behavior Transform Type)

This simple type specifies how the behavior animates the target element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|-----------------|
| img (Image) | Image transform |
| pt (Point) | Point transform |

| Referenced By |
|---------------------------|
| cBhvr@xfrmType (§19.5.22) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLBehaviorTransformType](#)) is located in §A.3. *end note*]

19.7.31 ST_TLChartSubelementType (Chart Subelement Type)

This simple type defines an animation target element that is represented by a subelement of a chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--------------------------------------|
| category (Category Axis) | Category |
| gridLegend (Grid Legend) | Background Element (Grid and Legend) |
| ptInCategory (Single Point in Category) | Category Element |
| ptInSeries (Single Point in Data Series) | Series Element |
| series (Data Series) | Series |

| Referenced By |
|----------------------------|
| oleChartEl@type (§19.5.52) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLChartSubelementType](#)) is located in §A.3. *end note*]

19.7.32 ST_TLCommandType (Command Type)

This simple type specifies a command type.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------------|-------------|
| call (Command Type Enum (Call)) | Call |
| evt (Command Type Enum (Event)) | Event |
| verb (Command Type Enum (Verb)) | Verb |

| Referenced By |
|---------------------|
| cmd@type (§19.5.28) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLCommandType](#)) is located in §A.3. *end note*]

19.7.33 ST_TLDiagramBuildType (Diagram Build Types)

This simple type specifies the different diagram build types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-----------------------|
| allAtOnce (Diagram Build Type Enum (All At Once)) | All At Once |
| breadthByLvl (Diagram Build Type Enum (Breadth By Level)) | Breadth By Level |
| breadthByNode (Diagram Build Type Enum (Breadth By Node)) | Breadth By Node |
| ccw (Diagram Build Type Enum (Counter-Clockwise)) | Counter-Clockwise |
| ccwIn (Diagram Build Type Enum (Counter-Clockwise-In)) | Counter-Clockwise-In |
| ccwOut (Diagram Build Type Enum (Counter-Clockwise-Out)) | Counter-Clockwise-Out |
| cust (Diagram Build Type Enum (Custom)) | Custom |
| cw (Diagram Build Type Enum (Clockwise)) | Clockwise |
| cwIn (Diagram Build Type Enum (Clockwise-In)) | Clockwise-In |
| cwOut (Diagram Build Type Enum (Clockwise-Out)) | Clockwise-Out |
| depthByBranch (Diagram Build Type Enum (Depth By Branch)) | Depth By Branch |
| depthByNode (Diagram Build Type Enum (Depth By Node)) | Depth By Node |
| down (Diagram Build Type Enum (Down)) | Down |

| Enumeration Value | Description |
|---|-------------|
| inByRing (Diagram Build Type Enum (In-By-Ring)) | In-By-Ring |
| outByRing (Diagram Build Type Enum (Out-By-Ring)) | Out-By-Ring |
| up (Diagram Build Type Enum (Up)) | Up |
| whole (Diagram Build Type Enum (Whole)) | Whole |

| Referenced By |
|-----------------------|
| bldDgm@bld (§19.5.12) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLDiagramBuildType](#)) is located in §A.3. *end note*]

19.7.34 ST_TLNextActionType (Next Action Type)

This simple type specifies what to do when going forward in a sequence. When the value is "seek," it seeks the current child element to its natural end time before advancing to the next element.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---------------------------------------|-------------|
| none (Next Action Type Enum (None)) | None |
| seek (Next Action Type Enum (Seek)) | Seek |

| Referenced By |
|-----------------------|
| seq@nextAc (§19.5.65) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLNextActionType](#)) is located in §A.3. *end note*]

19.7.35 ST_TLOleChartBuildType (Embedded Chart Build Type)

This simple type describes how to build an embedded Chart.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------|
| allAtOnce (Chart Build Type Enum (All At Once)) | All At Once |

| Enumeration Value | Description |
|---|---------------------|
| category (Chart Build Type Enum (Category)) | By Category |
| categoryEl (Chart Build Type Enum (Category Element)) | By Category Element |
| series (Chart Build Type Enum (Series)) | By Series |
| seriesEl (Chart Build Type Enum (Series Element)) | By Series Element |

| Referenced By |
|----------------------------|
| bldOleChart@bld (§19.5.15) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLOleChartBuildType](#)) is located in §A.3. *end note*]

19.7.36 ST_TLParaBuildType (Paragraph Build Type)

This simple type describes how to build a paragraph.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------|--|
| allAtOnce (All At Once) | Specifies to animate all paragraphs at once. |
| cust (Custom) | Specifies the build has custom user settings. |
| p (Paragraph) | Specifies to animate paragraphs grouped by bullet level. |
| whole (Whole) | Specifies to animate the entire body of text as one block. |

| Referenced By |
|-----------------------|
| bldP@build (§19.5.16) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLParaBuildType](#)) is located in §A.3. *end note*]

19.7.37 ST_TLPreviousActionType (Previous Action Type)

This simple type specifies what to do when going backwards in a sequence. When the value is "skipTimed," the sequence continues to go backwards until it reaches a sequence element that was defined to being only on a "next" event.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|-------------|
| none (Previous Action Type Enum (None)) | None |
| skipTimed (Previous Action Type Enum (Skip Timed)) | Skip Timed |

| Referenced By |
|-----------------------|
| seq@prevAc (§19.5.65) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLPreviousActionType](#)) is located in §A.3. *end note*]

19.7.38 ST_TLTime (Time)

This simple type specifies time after which to automatically advance the build to the next step. An amount of time, in milliseconds.

This simple type is a union of the following types:

- The ST_TLTimeIndefinite simple type (§19.7.40).
- The W3C XML Schema unsignedInt datatype.

| Referenced By |
|--|
| bldP@advAuto (§19.5.16); cond@delay (§19.5.31); cTn@dur (§19.5.33); cTn@repeatCount (§19.5.33); cTn@repeatDur (§19.5.33); endSync@delay (§19.5.39); tmAbs@val (§19.5.82) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTime](#)) is located in §A.3. *end note*]

19.7.39 ST_TLTimeAnimateValueTime (Animation Time)

This simple type specifies a percentage within the time span of the element. A value of `indefinite` means the attribute should be ignored.

This simple type is a union of the following types:

- The ST_PositiveFixedPercentage simple type (§20.1.10.44).
- The ST_TLTimeIndefinite simple type (§19.7.40).

| Referenced By |
|-------------------|
| tav@tm (§19.5.79) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeAnimateValueType](#)) is located in §A.3. *end note*]

19.7.40 ST_TLTimeIndefinite (Indefinite Time Declaration)

This simple type specifies a value that designates an "indefinite" amount time -- typically means this property is subordinate to other, defined properties.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------------|---------------------------|
| indefinite (Indefinite Type Enum) | Specifies Indefinite Time |

| Referenced By |
|--|
| ST_TLTime (§19.7.38); ST_TLTimeAnimateValueType (§19.7.39) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTimeIndefinite](#)) is located in §A.3. *end note*]

19.7.41 ST_TLTimeNodeFillType (Time Node Fill Type)

This simple type specifies what modifications the effect leaves on the target element's properties when the effect ends.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------|
| freeze (Freeze) | Freeze |
| hold (TimeNode Fill Type Enum (Hold)) | Hold |
| remove (Remove) | Remove |
| transition (Transition) | Transition |

| Referenced By |
|---------------------|
| cTn@fill (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeFillType](#)) is located in §A.3. *end note*]

19.7.42 ST_TLTimeNodeID (Time Node ID)

This simple type represents a node or event on the timeline by its identifier.

This simple type's contents are a restriction of the W3C XML Schema unsignedInt datatype.

| Referenced By |
|--------------------------------------|
| cTn@id (§19.5.33); tn@val (§19.5.86) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeID](#)) is located in §A.3. *end note*]

19.7.43 ST_TLTimeNodeMasterRelation (Time Node Master Relation)

This simple type specifies how the time node plays back relative to its master time node.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|-------------|
| lastClick (TimeNode Master Relation Enum (Last Click)) | Last Click |
| nextClick (TimeNode Master Relation Enum (Next Click)) | Next Click |
| sameClick (TimeNode Master Relation Enum (Same Click)) | Same Click |

| Referenced By |
|--------------------------|
| cTn@masterRel (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeMasterRelation](#)) is located in §A.3. *end note*]

19.7.44 ST_TLTimeNodePresetClassType (Time Node Preset Class Type)

This simple type specifies the class of effect in which this effect belongs.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------------|
| emph (Preset Type Enum (Emphasis)) | Emphasis Preset |
| entr (Preset Type Enum (Entrance)) | Entrance Preset |
| exit (Exit) | Exit Preset |
| mediacall (Preset Type Enum (Media Call)) | Media Call Preset |
| path (Preset Type Enum (Path)) | Path Preset |
| verb (Preset Type Enum (Verb)) | Verb Preset |

| Referenced By |
|----------------------------|
| cTn@presetClass (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodePresetClassType](#)) is located in §A.3. *end note*]

19.7.45 ST_TLTimeNodeRestartType (Time Node Restart Type)

This simple type determines whether an effect can play more than once.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|---------------------------------|
| always (Restart Enum (Always)) | Always restart node |
| never (Restart Enum (Never)) | Never restart node |
| whenNotActive (Restart Enum (When Not Active)) | Restart when node is not active |

| Referenced By |
|------------------------|
| cTn@restart (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeRestartType](#)) is located in §A.3. *end note*]

19.7.46 ST_TLTimeNodeSyncType (Time Node Sync Type)

This simple type specifies how the time node synchronizes to its group.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------|
| canSlip (TimeNode Sync Enum (Can Slip)) | Can Slip |
| locked (TimeNode Sync Enum (Locked)) | Locked |

| Referenced By |
|-----------------------------|
| cTn@syncBehavior (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeSyncType](#)) is located in §A.3. *end note*]

19.7.47 ST_TLTimeNodeType (Time Node Type)

This simple type specifies time node types.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|----------------------|
| afterEffect (Node Type Enum (After Effect)) | After Effect |
| afterGroup (Node Type Enum (After Group)) | After Group |
| clickEffect (Node Type Enum (Click Effect)) | Click Effect |
| clickPar (Node Type Enum (Click Paragraph)) | Click Paragraph |
| interactiveSeq (Node Type Enum (Interactive Sequence)) | Interactive Sequence |
| mainSeq (Node Type Enum (Main Sequence)) | Main Sequence |
| tmRoot (Node Type Enum (Timing Root)) | Timing Root |
| withEffect (Node Type Enum (With Effect)) | With Effect |
| withGroup (Node Type Enum (With Group)) | With Group |

| Referenced By |
|-------------------------|
| cTn@nodeType (§19.5.33) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTimeNodeType](#)) is located in §A.3. *end note*]

19.7.48 ST_TLTriggerEvent (Trigger Event)

This simple type specifies a particular event that causes the time condition to be true.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|------------------------------------|
| begin (Trigger Event Enum (Begin)) | Fire trigger at the beginning |
| end (Trigger Event Enum (End)) | Fire trigger at the end |
| onBegin (Trigger Event Enum (On Begin)) | Fire trigger at the beginning |
| onClick (Trigger Event Enum (On Click)) | Fire trigger on a mouse click |
| onDbClick (Trigger Event Enum (On Double Click)) | Fire trigger on double-mouse click |
| onEnd (Trigger Event Enum (On End)) | Fire trigger at the end |
| onMouseOut (Trigger Event Enum (On Mouse Out)) | Fire trigger on mouse out |
| onMouseOver (Trigger Event Enum (On Mouse Over)) | Fire trigger on mouse over |
| onNext (Trigger Event Enum (On Next)) | Fire trigger on next node |
| onPrev (Trigger Event Enum (On Previous)) | Fire trigger on previous node |
| onStopAudio (Trigger Event Enum (On Stop Audio)) | Fire trigger on stop audio |

| Referenced By |
|---|
| cond@evt (§19.5.31); endSync@evt (§19.5.39) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TLTriggerEvent](#)) is located in §A.3. *end note*]

19.7.49 ST_TLTriggerRuntimeNode (Trigger RunTime Node)

This simple type specifies the child time node that triggers a time condition. References a child TimeNode or all child nodes. Order is based on the child's end time.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|-------------|
| all (Trigger RunTime Node Enum (All)) | All |
| first (Trigger RunTime Node (First)) | First |
| last (Trigger RunTime Node (Last)) | Last |

| Referenced By |
|--------------------|
| rtn@val (§19.5.64) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TLTriggerRuntimeNode](#)) is located in §A.3. *end note*]

19.7.50 ST_TransitionCornerDirectionType (Transition Corner Direction Type)

This simple type specifies diagonal directions for slide transitions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--|
| ld (Transition Corner Direction Enum (Left-Down)) | Specifies the slide transition direction of left-down |
| lu (Transition Corner Direction Enum (Left-Up)) | Specifies the slide transition direction of left-up |
| rd (Transition Corner Direction Enum (Right-Down)) | Specifies the slide transition direction of right-down |
| ru (Transition Corner Direction Enum (Right-Up)) | Specifies the slide transition direction of right-up |

| Referenced By |
|---|
| ST_TransitionEightDirectionType (§19.7.51); strips@dir (§19.5.74) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TransitionCornerDirectionType](#)) is located in §A.3. *end note*]

19.7.51 ST_TransitionEightDirectionType (Transition Eight Direction)

This simple type specifies the direction of an animation.

This simple type is a union of the following types:

- The ST_TransitionCornerDirectionType simple type (§19.7.50).
- The ST_TransitionSideDirectionType simple type (§19.7.53).

| Referenced By |
|---|
| cover@dir (§19.5.32); pull@dir (§19.5.58) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_TransitionEightDirectionType](#)) is located in §A.3. *end note*]

19.7.52 ST_TransitionInOutDirectionType (Transition In/Out Direction Type)

This simple type specifies if a slide transition should go in or out.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--|
| in (Transition In/Out Direction Enum (In)) | Specifies the slide transition should go in |
| out (Transition In/Out Direction Enum (Out)) | Specifies the slide transition should go out |

| Referenced By |
|---|
| split@dir (§19.5.71); zoom@dir (§19.5.97) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionInOutDirectionType](#)) is located in §A.3. *end note*]

19.7.53 ST_TransitionSideDirectionType (Transition Side Direction Type)

This simple type defines a set of slide transition directions.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| d (Transition Side Direction Enum (Down)) | Specifies that the transition direction is down |
| l (Transition Side Direction Enum (Left)) | Specifies that the transition direction is left |
| r (Transition Side Direction (Right)) | Specifies that the transition direction is right |
| u (Transition Side Direction Enum (Up)) | Specifies that the transition direction is up |

| Referenced By |

| push@dir (§19.5.59); ST_TransitionEightDirectionType (§19.7.51); wipe@dir (§19.5.96) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_TransitionSideDirectionType](#)) is located in §A.3. *end note*]

19.7.54 ST_TransitionSpeed (Transition Speed)

This simple type defines the allowed transition speeds for transitioning from the current slide to the next.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--------------------------|
| fast (Fast) | Fast slide transition. |
| med (Medium) | Medium slide transition. |
| slow (low) | Slow slide transition. |

| Referenced By |
|-----------------------------|
| transition@spd (§19.3.1.50) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_TransitionSpeed](#)) is located in §A.3. *end note*]

19.7.55 ST_ViewType (List of View Types)

This simple type specifies the kind of view that should be used when displaying the presentation document to the user.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| handoutView (Handout View) | Handout View mode should be used. |
| notesMasterView (Notes Master View) | Notes Master View mode should be used. |
| notesView (Notes View) | Notes View mode should be used. |
| outlineView (Outline View) | Outline View mode should be used. |
| sldMasterView (Slide Master View) | Slide Master View mode should be used. |
| sldSorterView (Slide Sorter View) | Slide Sorter View mode should be used. |
| sldThumbnailView (Slide Thumbnail View) | Slide Thumbnail View mode should be used. |
| sldView (Normal Slide View) | Normal Slide View mode should be used. |

| Referenced By |
|------------------------------|
| viewPr@lastView (§19.2.2.18) |

[*Note*: The W3C XML Schema definition of this simple type's content model ([ST_ViewType](#)) is located in §A.3. *end note*]

20. DrawingML - Framework Reference Material

The subordinate subclauses specify the semantics for the XML markup comprising DrawingML content, which can be used within the contents of WordprocessingML, SpreadsheetML, or PresentationML documents.

This portion of DrawingML defines its core pieces.

20.1 DrawingML - Main

The DrawingML Main namespace defines all of the base constructs for all kinds of DrawingML objects (charts, diagrams, shapes, pictures, and so on). These constructs and primitives are defined below.

20.1.1 Table of Contents

This subclause is informative.

| | |
|--|-------------|
| 20.1.2 Basics | 3021 |
| 20.1.2.1 EMU Unit of Measurement | 3021 |
| 20.1.2.2 Core Drawing Object Information | 3021 |
| 20.1.2.2.1 bldChart (Build Chart) | 3021 |
| 20.1.2.2.2 bldDgm (Build Diagram) | 3022 |
| 20.1.2.2.3 chart (Chart to Animate) | 3023 |
| 20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties) | 3023 |
| 20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties) | 3024 |
| 20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties) | 3024 |
| 20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties) | 3025 |
| 20.1.2.2.8 cNvPr (Non-Visual Drawing Properties) | 3026 |
| 20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties) | 3028 |
| 20.1.2.2.10 cxnSp (Connection Shape) | 3029 |
| 20.1.2.2.11 cxnSpLocks (Connection Shape Locks) | 3031 |
| 20.1.2.2.12 dgm (Diagram to Animate) | 3032 |
| 20.1.2.2.13 endCxn (Connection End) | 3033 |
| 20.1.2.2.14 ext (Extension) | 3034 |
| 20.1.2.2.15 extLst (Extension List) | 3034 |
| 20.1.2.2.16 graphic (Graphic Object) | 3035 |
| 20.1.2.2.17 graphicData (Graphic Object Data) | 3036 |
| 20.1.2.2.18 graphicFrame (Graphic Frame) | 3036 |
| 20.1.2.2.19 graphicFrameLocks (Graphic Frame Locks) | 3037 |
| 20.1.2.2.20 grpSp (Group shape) | 3038 |
| 20.1.2.2.21 grpSpLocks (Group Shape Locks) | 3040 |
| 20.1.2.2.22 grpSpPr (Visual Group Shape Properties) | 3041 |
| 20.1.2.2.23 hlinkHover (Hyperlink for Hover) | 3042 |

End of informative text.

20.1.2 Basics

This section describes all the basic common elements associated with the DrawingML framework.

20.1.2.1 EMU Unit of Measurement

Throughout ECMA-376, the EMU is used as a unit of measurement for length. An *EMU* is defined as follows:

$$1 \text{ emu} = \frac{1}{914400} \text{ US inch} = \frac{1}{360000} \text{ cm}$$

[*Rationale*: The EMU was created in order to be able to evenly divide in both English and Metric units, in order to avoid rounding errors during the calculation. The usage of EMUs also facilitates a more seamless system switch and interoperability between different locales utilizing different units of measurement. EMUs define an integer based, high precision coordinate system. *end rationale*]

20.1.2.2 Core Drawing Object Information

Within DrawingML, there is the notion of core drawing elements. These are elements that both are vital to and common across the DrawingML framework. These elements denote the most integral pieces of the DrawingML document structure and thus are among the most widely used.

[*Note*: Measurement Units - Length units must be expressed in device-independent physical units: English Metric units (EMUs), points, picas, and inches. Device-dependent units such as pixels must not be used. *end note*]

20.1.2.2.1 bldChart (Build Chart)

This element specifies how to build the animation for a diagram.

[*Example*: Consider the following example where a chart is specified to be animated by category rather than as one entity. Thus, the bldChart element should be used as follows:

```
<p:bdldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldChart bld="category"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bdldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldSub (§19.5.17) |

| Attributes | Description |
|-----------------------------|--|
| animBg (Animate Background) | Specifies whether or not the chart background elements should be animated as well. [<i>Note</i> : An example of background elements are grid lines and the chart legend. <i>end note</i>] The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| bld (Build) | Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. The possible values for this attribute are defined by the ST_AnimationChartBuildType simple type (§20.1.10.5). |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_AnimationChartBuildProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.2 bldDgm (Build Diagram)

This element specifies how to build the animation for a diagram.

[*Example*: Consider having a diagram appear as an entity as opposed to by section. The bldDgm element should be used as follows:

```
<p:bldLst>
  <p:bldGraphic spid="4" grpId="0">
    <p:bldSub>
      <a:bldDgm bld="one"/>
    </p:bldSub>
  </p:bldGraphic>
</p:bldLst>
```

end example]

| Parent Elements |
|-------------------|
| bldSub (§19.5.17) |

| Attributes | Description |
|-------------|---|
| bld (Build) | Specifies how the chart is built. The animation animates the sub-elements in the container in the particular order defined by this attribute. |

| Attributes | Description |
|-------------------------|--|
| | The possible values for this attribute are defined by the ST_AnimationDgmBuildType simple type (§20.1.10.7). |
| rev (Reverse Animation) | Specifies whether the animation of the objects in this diagram should be reversed or not. If this attribute is not specified, a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationDgmBuildProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.3 chart (Chart to Animate)

This element specifies a reference to a chart that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a chart there is also animation build steps defined.

| Parent Elements |
|----------------------|
| graphicEl (§19.5.45) |

| Attributes | Description |
|--------------------------------|--|
| bldStep (Animation Build Step) | Specifies which step this part of the chart should be built using. For instance the chart can be built as one object meaning it is animated as a single graphic. Alternatively the chart can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_ChartBuildStep simple type (§20.1.10.13). |
| categoryIdx (Category Index) | Specifies the index of the category within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype. |
| seriesIdx (Series Index) | Specifies the index of the series within the corresponding chart that should be animated. The possible values for this attribute are defined by the W3C XML Schema int datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationChartElement](#)) is located in §A.4.1. *end note*]

20.1.2.2.4 cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties)

This element specifies the non-visual drawing properties for a connector shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

| Parent Elements |
|--------------------------|
| nvCxnSpPr (§20.1.2.2.25) |

| Child Elements | Subclause |
|-------------------------------------|--------------|
| cxnSpLocks (Connection Shape Locks) | §20.1.2.2.11 |
| endCxn (Connection End) | §20.1.2.2.13 |
| extLst (Extension List) | §20.1.2.2.15 |
| stCxn (Connection Start) | §20.1.2.2.36 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT NonVisualConnectorProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.5 cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties)

This element specifies the non-visual drawing properties for a graphic frame. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

| Parent Elements |
|---------------------------------|
| nvGraphicFramePr (§20.1.2.2.26) |

| Child Elements | Subclause |
|---|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| graphicFrameLocks (Graphic Frame Locks) | §20.1.2.2.19 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT NonVisualGraphicFrameProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.6 cNvGrpSpPr (Non-Visual Group Shape Drawing Properties)

This element specifies the non-visual drawing properties for a group shape. These non-visual properties are properties that the generating application would utilize when rendering the slide surface.

| Parent Elements |
|--------------------------|
| nvGrpSpPr (§20.1.2.2.27) |

| Child Elements | Subclause |
|--------------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| grpSpLocks (Group Shape Locks) | §20.1.2.2.21 |

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualGroupDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.7 cNvPicPr (Non-Visual Picture Drawing Properties)

This element specifies the non-visual properties for the picture canvas. These properties are to be used by the generating application to determine how certain properties are to be changed for the picture object in question.

[*Example:* Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
  <p:cNvPicPr>
    <a:picLocks noChangeAspect="1"/>
  </p:cNvPicPr>
</p:nvPicPr>
...
</p:pic>
```

end example]

| Parent Elements |
|------------------------|
| nvPicPr (§20.1.2.2.28) |

| Child Elements | Subclause |
|--------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| picLocks (Picture Locks) | §20.1.2.2.31 |

| Attributes | Description |
|--|---|
| preferRelativeResize (Relative Resize Preferred) | <p>Specifies if the user interface should show the resizing of the picture based on the picture's current size or its original size. If this attribute is set to true, then scaling is relative to the original picture size as opposed to the current picture size.</p> <p>[<i>Example:</i> Consider the case where a picture has been resized within a document and is now 50% of the originally inserted picture size. Now if the user chooses to make a later adjustment to the size of this picture within the generating application, then the value of this attribute should be checked.</p> |

| Attributes | Description |
|------------|---|
| | <p>If this attribute is set to true then a value of 50% is shown. Similarly, if this attribute is set to false, then a value of 100% should be shown because the picture has not yet been resized from its current (smaller) size. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_NonVisualPictureProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.8 cNvPr (Non-Visual Drawing Properties)

This element specifies non-visual canvas properties. This allows for additional information that does not affect the appearance of the picture to be stored.

[Example: Consider the following DrawingML.

```
<p:pic>
...
<p:nvPicPr>
  <p:cNvPr id="4" name="Lilly_by_Lisher.jpg"/>
</p:nvPicPr>
...
</p:pic>
```

end example]

| Parent Elements |
|--|
| nvCxnSpPr (§20.1.2.2.25); nvGraphicFramePr (§20.1.2.2.26); nvGrpSpPr (§20.1.2.2.27); nvPicPr (§20.1.2.2.28); nvSpPr (§20.1.2.2.29) |

| Child Elements | Subclause |
|----------------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| hlinkClick (Click Hyperlink) | §21.1.2.3.5 |
| hlinkHover (Hyperlink for Hover) | §20.1.2.2.23 |

| Attributes | Description |
|-------------------------------------|--|
| descr (Alternative Text for Object) | <p>Specifies alternative text for the current DrawingML object, for use by assistive technologies or applications which do not display the current object.</p> <p>If this element is omitted, then no alternative text is present for the parent object.</p> |

| Attributes | Description |
|------------------------|--|
| | <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... descr="A picture of a bowl of fruit"></pre> <p>The descr attribute contains alternative text which can be used in place of the actual DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| hidden (Hidden) | <p>Specifies whether this DrawingML object is displayed. When a DrawingML object is displayed within a document, that object can be hidden (i.e., present, but not visible). This attribute determines whether the object is rendered or made hidden. [<i>Note</i>: An application can have settings which allow this object to be viewed. <i>end note</i>]</p> <p>If this attribute is omitted, then the parent DrawingML object shall be displayed (i.e., not hidden).</p> <p>[<i>Example</i>: Consider an inline DrawingML object which must be hidden within the document's content. This setting would be specified as follows:</p> <pre><... hidden="true" /></pre> <p>The hidden attribute has a value of true, which specifies that the DrawingML object is hidden and not displayed when the document is displayed. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| id (Unique Identifier) | <p>Specifies a unique identifier for the current DrawingML object within the current document. This ID can be used to assist in uniquely identifying this object so that it can be referred to by other parts of the document.</p> <p>If multiple objects within the same document share the same id attribute value, then the document shall be considered non-conformant.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... id="10" ... ></pre> <p>The id attribute has a value of 10, which is the unique identifier for this DrawingML object. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21).</p> |
| name (Name) | <p>Specifies the name of the object. [<i>Note</i>: Typically, this is used to store the original file</p> |

| Attributes | Description |
|---------------|--|
| | <p>name of a picture object. <i>end note</i></p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre>< ... name="foo.jpg" ></pre> <p>The name attribute has a value of <code>foo.jpg</code>, which is the name of this DrawingML object. <i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| title (Title) | <p>Specifies the title (caption) of the current DrawingML object.</p> <p>If this attribute is omitted, then no title text is present for the parent object.</p> <p>[<i>Example</i>: Consider a DrawingML object defined as follows:</p> <pre><... title="Process Flow Diagram"></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_NonVisualDrawingProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.9 cNvSpPr (Non-Visual Shape Drawing Properties)

This element specifies the non-visual drawing properties for a shape. These properties are to be used by the generating application to determine how the shape should be dealt with

[*Example*: Consider the shape that has a shape lock applied to it.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 1"/>
    <p:cNvSpPr>
      <a:spLocks noGrp="1"/>
    </p:cNvSpPr>
  </p:nvSpPr>
  ...
</p:sp>
```

This shape lock is stored within the non-visual drawing properties for this shape. *end example*]

| Parent Elements |
|-----------------------|
| nvSpPr (§20.1.2.2.29) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| spLocks (Shape Locks) | §20.1.2.2.34 |

| Attributes | Description |
|------------------|--|
| txBox (Text Box) | <p>Specifies that the corresponding shape is a text box and thus should be treated as such by the generating application. If this attribute is omitted then it is assumed that the corresponding shape is not specifically a text box.</p> <p>[<i>Note</i>: Because a shape is not specified to be a text box does not mean that it cannot have text attached to it. A text box is merely a specialized shape with specific properties. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_NonVisualDrawingShapeProps](#)) is located in §A.4.1. *end note*]

20.1.2.2.10 cxnSp (Connection Shape)

This element specifies a connection shape that is used to connect two sp elements. Once a connection is specified using a cxnSp, it is left to the generating application to determine the exact path the connector takes. That is the connector routing algorithm is left up to the generating application as the desired path might be different depending on the specific needs of the application.

[*Example*: Consider the following connector shape that connects two regular shapes.]

```
<p:spTree>
```

```
...
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="1" name="Rectangle 1"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
...
</p:sp>
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="2" name="Rectangle 2"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
...
</p:sp>
<p:cxnSp>
  <p:nvCxnSpPr>
    <p:cNvPr id="3" name="Elbow Connector 3"/>
    <p:cNvCxnSpPr>
      <a:stCxn id="1" idx="3"/>
      <a:endCxn id="2" idx="1"/>
    </p:cNvCxnSpPr>
    <p:nvPr/>
  </p:nvCxnSpPr>
...
</p:cxnSp>

20.1.2.2.11 cxnSpLocks (Connection Shape Locks)

This element specifies all locking properties for a connection shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

| Parent Elements |
|--|
| cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|---|---|
| noAdjustHandles (Disallow Showing Adjust Handles) | Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noChangeArrowheads (Disallow Arrowhead Changes) | Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noChangeAspect (Disallow Aspect Ratio Change) | Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noChangeShapeType (Disallow Shape Type Change) | Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noEditPoints (Disallow Shape Point Editing) | Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. |

| Attributes | Description |
|-------------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noGrp (Disallow Shape Grouping) | <p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noMove (Disallow Shape Movement) | <p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noResize (Disallow Shape Resize) | <p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noRot (Disallow Shape Rotation) | <p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noSelect (Disallow Shape Selection) | <p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_ConnectorLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.12 dgm (Diagram to Animate)

This element specifies a reference to a diagram that should be animated within a sequence of slide animations. In addition to simply acting as a reference to a diagram there is also animation build steps defined.

| Parent Elements |
|----------------------|
| graphicEl (§19.5.45) |

| Attributes | Description |
|--------------------------------|--|
| bldStep (Animation Build Step) | Specifies which step this part of the diagram should be built using. For instance the diagram can be built as one object meaning it is animated as a single graphic. Alternatively the diagram can be animated, or built as separate pieces. The possible values for this attribute are defined by the ST_DgmBuildStep simple type (§20.1.10.20). |
| id (Identifier) | Specifies the GUID of the shape for this build step in the animation. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4). |

[Note: The W3C XML Schema definition of this element's content model ([CT_AnimationDgmElement](#)) is located in §A.4.1. *end note*]

20.1.2.2.13 endCxn (Connection End)

This element specifies the ending connection that should be made by the corresponding connector shape. This connects the end tail of the connector to the final destination shape.

| Parent Elements |
|--|
| cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8) |

| Attributes | Description |
|-----------------|---|
| id (Identifier) | Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21). |
| idx (Index) | Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it shall be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Connection](#)) is located in §A.4.1. *end note*]

20.1.2.2.14 **ext** (Extension)

This element specifies an extension that is used for future extensions to the current version of DrawingML. This allows for the specifying of currently unknown elements in the future that is used for later versions of generating applications.

[*Note:* This element is not intended to reintroduce transitional schema into the strict conformance class. *end note*]

| Parent Elements |
|--|
| extLst (§21.4.2.13); extLst (§20.1.2.2.15) |

| Child Elements | Subclause |
|--|-----------|
| Zero or more elements in any namespace | n/a |

| Attributes | Description |
|-----------------------------------|---|
| uri (Uniform Resource Identifier) | Specifies the URI, or uniform resource identifier that represents the data stored under this tag. The URI is used to identify the correct 'server' that can process the contents of this tag. The possible values for this attribute are defined by the W3C XML Schema token datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OfficeArtExtension](#)) is located in §A.4.1. *end note*]

20.1.2.2.15 **extLst** (Extension List)

This element specifies the extension list within which all future extensions of element type **ext** is defined. The extension list along with corresponding future extensions is used to extend the storage capabilities of the DrawingML framework. This allows for various new types of data to be stored natively within the framework.

20.1.2.2.19 graphicFrameLocks (Graphic Frame Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

| Parent Elements |
|---|
| cNvGraphicFramePr (§21.3.2.4); cNvGraphicFramePr (§20.1.2.2.5); cNvGraphicFramePr (§20.5.2.5); cNvGraphicFramePr (§20.4.2.4); cNvGraphicFramePr (§19.3.1.9) |

| Child Elements | Subclause |
|-------------------------|---------------|
| extLst (Extension List) | \$20.1.2.2.15 |

| Attributes | Description |
|--|---|
| noChangeAspect (Disallow Aspect Ratio Change) | Specifies that the generating application should not allow aspect ratio changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noDrilldown (Disallow Selection of Child Shapes) | Specifies that the generating application should not allow selecting of objects within the corresponding graphic frame but allow selecting of the graphic frame itself. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noGrp (Disallow Shape Grouping) | Specifies that the generating application should not allow shape grouping for the corresponding graphic frame. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noMove (Disallow Shape Movement) | Specifies that the corresponding graphic frame cannot be moved. Objects that reside within the graphic frame can still be moved unless they also have been locked. If this attribute is not specified, then a value of false is assumed. |

| Attributes | Description |
|-------------------------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noResize (Disallow Shape Resize) | <p>Specifies that the generating application should not allow size changes for the corresponding graphic frame. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noSelect (Disallow Shape Selection) | <p>Specifies that the generating application should not allow selecting of the corresponding picture. That means also that no picture, shapes or text attached to this picture can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>[<i>Note</i>: If this attribute is specified to be true then the graphic frame cannot be selected and the objects within the graphic frame cannot be selected as well. That is the entire graphic frame including all sub-parts are considered un-selectable. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GraphicalObjectFrameLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.20 grpSp (Group shape)

This element specifies a group shape that represents many shapes grouped together. This shape is to be treated just as if it were a regular shape but instead of being described by a single geometry it is made up of all the shape geometries encompassed within it. Within a group shape each of the shapes that make up the group are specified just as they normally would. The idea behind grouping elements however is that a single transform can apply to many shapes at the same time.

[*Example*: Consider the following group shape.

```
<p:grpSp>
  <p:nvGrpSpPr>
    <p:cNvPr id="10" name="Group 9"/>
    <p:cNvGrpSpPr/>
    <p:nvPr/>
  </p:nvGrpSpPr>
```

```

<p:grpSpPr>
  <a:xfrm>
    <a:off x="838200" y="990600"/>
    <a:ext cx="2426208" cy="978408"/>
    <a:chOff x="838200" y="990600"/>
    <a:chExt cx="2426208" cy="978408"/>
  </a:xfrm>
</p:grpSpPr>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
<p:sp>
...
</p:sp>
</p:grpSp>

```

In the above example we see three shapes specified within a single group. These three shapes have their position and sizes specified just as they normally would within the shape tree. The generating application should apply the transformation after the bounding box for the group shape has been calculated. *end example*]

| Attributes | Description |
|-------------------------|---|
| action (Action Setting) | <p>Specifies an action that is to be taken when this hyperlink is activated. This can be used to specify a slide to be navigated to or a script of code to be run.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| endSnd (End Sounds) | Specifies if the URL in question should stop all sounds that are playing when it is clicked. |

| Attributes | Description |
|---|---|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| highlightClick (Highlight Click) | <p>Specifies if this attribute has already been used within this document. That is when a hyperlink has already been visited that this attribute would be utilized so the generating application can determine the color of this text. If this attribute is omitted, then a value of 0 or false is implied.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| history (Add Hyperlink to Page History) | <p>Specifies whether to add this URI to the history when navigating to it. This allows for the viewing of this presentation without the storing of history information on the viewing machine. If this attribute is omitted, then a value of 1 or true is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| id (Drawing Object Hyperlink Target) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | <p>Specifies the relationship id that when looked up in this slides relationship file contains the target of this hyperlink. This attribute cannot be omitted.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p> |
| invalidUrl (Invalid URL) | <p>Specifies the URL when it has been determined by the generating application that the URL is invalid. That is the generating application can still store the URL but it is known that this URL is not correct.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| tgtFrame (Target Frame) | <p>Specifies the target frame that is to be used when opening this hyperlink. When the hyperlink is activated this attribute is used to determine if a new window is launched for viewing or if an existing one can be used. If this attribute is omitted, then a new window is opened.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| tooltip (Hyperlink Tooltip) | <p>Specifies the tooltip that should be displayed when the hyperlink text is hovered over with the mouse. If this attribute is omitted, then the hyperlink text itself can be displayed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Hyperlink](#)) is located in §A.4.1. *end note*]

20.1.2.2.24 **ln (Outline)**

This element specifies an outline style that can be applied to a number of different objects such as shapes and text. The line allows for the specifying of many different types of outlines including even line dashes and bevels.

| Parent Elements |
|--|
| bottom (§20.1.4.2.6); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); insideH (§20.1.4.2.14); insideV (§20.1.4.2.15); left (§20.1.4.2.18); lnStyleLst (§20.1.4.1.21); right (§20.1.4.2.22); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tl2br (§20.1.4.2.31); top (§20.1.4.2.32); tr2bl (§20.1.4.2.33); whole (§21.4.3.9) |

| Child Elements | Subclause |
|-------------------------------|--------------|
| bevel (Line Join Bevel) | §20.1.8.9 |
| custDash (Custom Dash) | §20.1.8.21 |
| extLst (Extension List) | §20.1.2.2.15 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| headEnd (Line Head/End Style) | §20.1.8.38 |

| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| prstDash (Preset Dash) | §20.1.8.48 |
| round (Round Line Join) | §20.1.8.52 |
| solidFill (Solid Fill) | §20.1.8.54 |
| tailEnd (Tail line end style) | §20.1.8.57 |

| Attributes | Description |
|----------------------------|---|
| algn (Stroke Alignment) | Specifies the alignment to be used for the underline stroke. The possible values for this attribute are defined by the ST_PenAlignment simple type (§20.1.10.39). |
| cap (Line Ending Cap Type) | Specifies the ending caps that should be used for this line. [<i>Note:</i> Examples of cap types are rounded, flat, etc. <i>end note</i>] If this attribute is omitted, than a value of square is assumed. The possible values for this attribute are defined by the ST_LineCap simple type (§20.1.10.31). |

| Attributes | Description |
|---------------------------|---|
| cmpd (Compound Line Type) | Specifies the compound line type to be used for the underline stroke. If this attribute is omitted, then a value of sng is assumed. The possible values for this attribute are defined by the ST_CompoundLine simple type (§20.1.10.15). |
| w (Line Width) | Specifies the width to be used for the underline stroke. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the ST_LineWidth simple type (§20.1.10.35). |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.25 nvCxnSpPr (Non-Visual Properties for a Connection Shape)

This element specifies all non-visual properties for a connection shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a connection shape. This allows for additional information that does not affect the appearance of the connection shape to be stored.

| Parent Elements |
|----------------------|
| cxnSp (§20.1.2.2.10) |

| Child Elements | Subclause |
|--|-------------|
| cNvCxnSpPr (Non-Visual Connector Shape Drawing Properties) | §20.1.2.2.4 |
| cNvPr (Non-Visual Drawing Properties) | §20.1.2.2.8 |

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlConnectorNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.26 nvGraphicFramePr (Non-Visual Properties for a Graphic Frame)

This element specifies all non-visual properties for a graphic frame. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a graphic frame. This allows for additional information that does not affect the appearance of the graphic frame to be stored.

| Parent Elements |
|-----------------------------|
| graphicFrame (§20.1.2.2.18) |

| Child Elements | Subclause |
|---|-------------|
| cNvGraphicFramePr (Non-Visual Graphic Frame Drawing Properties) | §20.1.2.2.5 |
| cNvPr (Non-Visual Drawing Properties) | §20.1.2.2.8 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GvmlGraphicFrameNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.27 nvGrpSpPr (Non-Visual Properties for a Group Shape)

This element specifies all non-visual properties for a group shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a group shape. This allows for additional information that does not affect the appearance of the group shape to be stored.

| Parent Elements |
|--|
| grpSp (§20.1.2.2.20); lockedCanvas (§20.3.2.1) |

| Child Elements | Subclause |
|--|-------------|
| cNvGrpSpPr (Non-Visual Group Shape Drawing Properties) | §20.1.2.2.6 |
| cNvPr (Non-Visual Drawing Properties) | §20.1.2.2.8 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GvmlGroupShapeNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.28 nvPicPr (Non-Visual Properties for a Picture)

This element specifies all non-visual properties for a picture. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a picture. This allows for additional information that does not affect the appearance of the picture to be stored.

[*Example*: Consider the following PresentationML.

```
<p:pic>
...
  <p:nvPicPr>
    ...
  </p:nvPicPr>
...
</p:pic>
```

end example]

| Parent Elements |
|--------------------|
| pic (§20.1.2.2.30) |

| Child Elements | Subclause |
|--|-------------|
| cNvPicPr (Non-Visual Picture Drawing Properties) | §20.1.2.2.7 |
| cNvPr (Non-Visual Drawing Properties) | §20.1.2.2.8 |

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlPictureNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.29 nvSpPr (Non-Visual Properties for a Shape)

This element specifies all non-visual properties for a shape. This element is a container for the non-visual identification properties, shape properties and application properties that are to be associated with a shape. This allows for additional information that does not affect the appearance of the shape to be stored.

| Parent Elements |
|-------------------|
| sp (§20.1.2.2.33) |

| Child Elements | Subclause |
|---|-------------|
| cNvPr (Non-Visual Drawing Properties) | §20.1.2.2.8 |
| cNvSpPr (Non-Visual Shape Drawing Properties) | §20.1.2.2.9 |

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlShapeNonVisual](#)) is located in §A.4.1. *end note*]

20.1.2.2.30 pic (Picture)

This element specifies the existence of a picture object within the document.

[Example: Consider the following PresentationML that specifies the existence of a picture within a document. This picture can have non-visual properties, a picture fill as well as shape properties attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="4" name="lake.JPG" descr="Picture of a Lake" />
    <p:cNvPicPr>
      <a:picLocks noChangeAspect="1"/>
    </p:cNvPicPr>
  </p:nvPicPr>
</p:pic>
```

```

    <p:blipFill>
    ...
    </p:blipFill>
    <p:spPr>
    ...
    </p:spPr>
  </p:pic>

```

end example]

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlPicture](#)) is located in §A.4.1.
end note]

20.1.2.2.31 picLocks (Picture Locks)

This element specifies all locking properties for a graphic frame. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

| Parent Elements |
|---|
| cNvPicPr (§21.3.2.6); cNvPicPr (§20.1.2.2.7); cNvPicPr (§20.2.2.2); cNvPicPr (§20.5.2.7); cNvPicPr (§19.3.1.11) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|---|--|
| noAdjustHandles (Disallow Showing Adjust Handles) | Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. |

| Attributes | Description |
|---|---|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noChangeArrowheads (Disallow Arrowhead Changes) | <p>Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noChangeAspect (Disallow Aspect Ratio Change) | <p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noChangeShapeType (Disallow Shape Type Change) | <p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noCrop (Disallow Crop Changes) | <p>Specifies that the generating application should not allow cropping for the corresponding picture. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noEditPoints (Disallow Shape Point Editing) | <p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noGrp (Disallow Shape Grouping) | <p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noMove (Disallow Shape Movement) | <p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

| Attributes | Description |
|-------------------------------------|--|
| noResize (Disallow Shape Resize) | <p>Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noRot (Disallow Shape Rotation) | <p>Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noSelect (Disallow Shape Selection) | <p>Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PictureLocking](#)) is located in §A.4.1. *end note*]

20.1.2.2.32 **snd (Hyperlink Sound)**

This element specifies a sound to be played when a hyperlink within the document is activated. This sound is specified from within the parent hyperlink element.

| Parent Elements |
|---|
| hlinkClick (§21.1.2.3.5); hlinkHover (§20.1.2.2.23); hlinkMouseOver (§21.1.2.3.6) |

| Attributes | Description |
|---|--|
| embed (Embedded Audio File Relationship ID) | <p>Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>]</p> |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p> |
| name (Sound) | <p>Specifies the original name or given short name for the corresponding sound. This is used</p> |

| Attributes | Description |
|------------|---|
| Name) | to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

20.1.2.2.33 sp (Shape)

This element specifies the existence of a single shape. A shape can either be a preset or a custom geometry, defined using the DrawingML framework. In addition to a geometry each shape can have both visual and non-visual properties attached. Text and corresponding styling information can also be attached to a shape. This shape is specified along with all other shapes within either the shape tree or group shape elements.

[Note: Shapes are the preferred mechanism for specifying text on a slide. *end note*]

| Parent Elements |
|--|
| grpSp (§20.1.2.2.20); lockedCanvas (§20.3.2.1) |

| Child Elements | Subclause |
|--|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| nvSpPr (Non-Visual Properties for a Shape) | §20.1.2.2.29 |

| style (Shape Style) | §20.1.2.2.37 |
| txSp (Text Shape) | §20.1.2.2.41 |

[Note: The W3C XML Schema definition of this element's content model ([CT_GvmlShape](#)) is located in §A.4.1. *end note*]

20.1.2.2.34 spLocks (Shape Locks)

This element specifies all locking properties for a shape. These properties inform the generating application about specific properties that have been previously locked and thus should not be changed.

| Parent Elements |
|---|
| cNvSpPr (§21.3.2.8); cNvSpPr (§20.1.2.2.9); cNvSpPr (§20.5.2.9); cNvSpPr (§19.3.1.13) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|---|---|
| noAdjustHandles (Disallow Showing Adjust Handles) | <p>Specifies that the generating application should not show adjust handles for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noChangeArrowheads (Disallow Arrowhead Changes) | <p>Specifies that the generating application should not allow arrowhead changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noChangeAspect (Disallow Aspect Ratio Change) | <p>Specifies that the generating application should not allow aspect ratio changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noChangeShapeType (Disallow Shape Type Change) | <p>Specifies that the generating application should not allow shape type changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noEditPoints (Disallow Shape Point Editing) | <p>Specifies that the generating application should not allow shape point changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noGrp (Disallow Shape Grouping) | <p>Specifies that the generating application should not allow shape grouping for the corresponding connection shape. That is it cannot be combined within other shapes to form a group of shapes. If this attribute is not specified, then a value of false is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| noMove (Disallow Shape Movement) | <p>Specifies that the generating application should not allow position changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed.</p> |

| Attributes | Description |
|--|---|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noResize (Disallow Shape Resize) | Specifies that the generating application should not allow size changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noRot (Disallow Shape Rotation) | Specifies that the generating application should not allow shape rotation changes for the corresponding connection shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noSelect (Disallow Shape Selection) | Specifies that the generating application should not allow selecting of the corresponding connection shape. That means also that no picture, shapes or text attached to this connection shape can be selected if this attribute has been specified. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| noTextEdit (Disallow Shape Text Editing) | Specifies that the generating application should not allow editing of the shape text for the corresponding shape. If this attribute is not specified, then a value of false is assumed. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_ShapeLocking](#)) is located in §A.4.1. end note]

20.1.2.2.35 spPr (Shape Properties)

This element specifies the visual shape properties that can be applied to a shape.

| Parent Elements |
|---|
| cxnSp (§20.1.2.2.10); lnDef (§20.1.4.1.20); pic (§20.1.2.2.30); sp (§20.1.2.2.33); spDef (§20.1.4.1.27); txDef (§20.1.4.1.28) |

| xfrm (2D Transform for Individual Objects) | §20.1.7.6 |

| Attributes | Description |
|-------------------------------|--|
| bwMode (Black and White Mode) | <p>Specifies that the picture should be rendered using only black and white coloring. That is the coloring information for the picture should be converted to either black or white when rendering the picture.</p> <p>No gray is to be used in rendering this image, only stark black and stark white.</p> <p>[<i>Note</i>: This does not mean that the picture itself that is stored within the file is necessarily a black and white picture. This attribute instead sets the rendering mode that the picture has applied to when rendering. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_BlackWhiteMode simple type (§20.1.10.10).</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_ShapeProperties](#)) is located in §A.4.1. *end note*]

20.1.2.2.36 stCxn (Connection Start)

This element specifies the starting connection that should be made by the corresponding connector shape. This connects the head of the connector to the first shape.

| Parent Elements |
|--|
| cNvCxnSpPr (§21.3.2.3); cNvCxnSpPr (§20.1.2.2.4); cNvCxnSpPr (§20.5.2.4); cNvCxnSpPr (§19.3.1.8) |

| Attributes | Description |
|-----------------|---|
| id (Identifier) | Specifies the id of the shape to make the final connection to. The possible values for this attribute are defined by the ST_DrawingElementId simple type (§20.1.10.21). |
| idx (Index) | Specifies the index into the connection site table of the final connection shape. That is there are many connection sites on a shape and it shall be specified which connection site the corresponding connector shape should connect to. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Connection](#)) is located in §A.4.1.
end note]

20.1.2.2.37 style (Shape Style)

This element specifies the style information for a shape.

| Parent Elements |
|---|
| cxnSp (§20.1.2.2.10); lnDef (§20.1.4.1.20); pic (§20.1.2.2.30); sp (§20.1.2.2.33); spDef (§20.1.4.1.27); txDef (§20.1.4.1.28) |

| Child Elements | Subclause |
|------------------------------|--------------|
| effectRef (Effect Reference) | §20.1.4.2.8 |
| fillRef (Fill Reference) | §20.1.4.2.10 |
| fontRef (Font Reference) | §20.1.4.1.17 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ShapeStyle](#)) is located in §A.4.1.
end note]

20.1.2.2.38 sx (Horizontal Ratio)

This element specifies the horizontal ratio for use within a scaling calculation.

| Parent Elements |
|--------------------|
| scale (§19.2.2.13) |

| Attributes | Description |
|-----------------|--|
| d (Denominator) | Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype. |
| n (Numerator) | Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Ratio](#)) is located in §A.4.1. *end note*]

20.1.2.2.39 sy (Vertical Ratio)

This element specifies the vertical ratio for use within a scaling calculation.

| Parent Elements |
|--------------------|
| scale (§19.2.2.13) |

| Attributes | Description |
|-----------------|--|
| d (Denominator) | Specifies the denominator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype. |
| n (Numerator) | Specifies the numerator to be used within the equation. The possible values for this attribute are defined by the W3C XML Schema long datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_Ratio](#)) is located in §A.4.1. *end note*]

20.1.2.2.40 txBody (Shape Text Body)

This element specifies the existence of text to be contained within the corresponding shape. All visible text and visible text related properties are contained within this element. There can be multiple paragraphs and within paragraphs multiple runs of text.

| Parent Elements |
|--------------------------------------|
| tc (§21.1.3.16); txSp (§20.1.2.2.41) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_TextBody](#)) is located in §A.4.1. *end note*]

20.1.2.2.41 txSp (Text Shape)

This element specifies the existence of a text shape within a parent shape. This text shape is specifically used for displaying text as it has only text related child elements.

| Parent Elements |
|---|
| grpSp (§20.1.2.2.20); lockedCanvas (§20.3.2.1); sp (§20.1.2.2.33) |

| Child Elements | Subclause |
|--|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| txBody (Shape Text Body) | §20.1.2.2.40 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlTextShape](#)) is located in §A.4.1. *end note*]

20.1.2.2.42 useSpRect (Use Shape Text Rectangle)

This element specifies that the text rectangle from the parent shape should be used for this text shape. If this attribute is specified then the text rectangle, or text bounding box as it is also called should have the same dimensions as the text bounding box of the parent shape within which this text shape resides.

| Parent Elements |
|---------------------|
| txSp (§20.1.2.2.41) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GvmlUseShapeRectangle](#)) is located in §A.4.1. *end note*]

20.1.2.3 Colors

Given its own section within DrawingML Basics, colors are an integral part of the DrawingML framework. Colors are used in virtually every object to help describe its appearance when it is rendered on the screen. Since not every generating application wishes to represent color in the same manner, it is possible to specify color in a number of different ways.

20.1.2.3.1 alpha (Alpha)

This element specifies its input color with the specific opacity, but with its color unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the opacity as expressed by a percentage value.</p> <p><i>[Example: The following represents a green solid fill which is 50% opaque</i></p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alpha val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.2 alphaMod (Alpha Modulation)

This element specifies a more or less opaque version of its input color. An alpha modulate never increases the alpha beyond 100%. A 200% alpha modulate makes a input color twice as opaque as before. A 50% alpha modulate makes a input color half as opaque as before.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the opacity as expressed by a percentage relative to the input color.</p> <p>[Example: The following represents a green solid fill which is 50% opaque</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alphaMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositivePercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.3 alphaOff (Alpha Offset)

This element specifies a more or less opaque version of its input color. Increases or decreases the input alpha percentage by the specified percentage offset. A 10% alpha offset increases a 50% opacity to 60%. A -10% alpha offset decreases a 50% opacity to 40%. The transformed alpha values are limited to a range of 0 to 100%. A 10% alpha offset increase to a 100% opaque object still results in 100% opacity.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the opacity as expressed by a percentage offset increase or decrease to the input color. Increases never increase the opacity beyond 100%, decreases never decrease the opacity below 0%.</p> <p>[Example: The following represents a green solid fill which is 90% opaque</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:alphaOff val="-10%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i></p> |

| Attributes | Description |
|------------|---|
| | The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |

[Note: The W3C XML Schema definition of this element's content model ([CT_FixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.4 blue (Blue)

This element specifies the input color with the specific blue component, but with the red and green color components unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the value of the blue component. The assigned value is specified as a percentage with 0% indicating minimal blue and 100% indicating maximum blue.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, FF, FF)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:blue val="100%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.5 blueMod (Blue Modulation)

This element specifies the input color with its blue component modulated by the given percentage. A 50% blue modulate reduces the blue component by half. A 200% blue modulate doubles the blue component.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the blue component as expressed by a percentage relative to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, 80)</p> <pre><a:solidFill> <a:srgbClr val="0000FF"> <a:blueMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.6 blueOff (Blue Offset)

This element specifies the input color with its blue component shifted, but with its red and green color components unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the blue component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the blue component beyond 100%, decreases never decrease the blue component below 0%.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, 00, CC)</p> |

| Attributes | Description |
|------------|--|
| | <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:blueOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Percentage](#)) is located in §A.4.1. *end note]*

20.1.2.3.7 **comp (Complement)**

This element specifies that the color rendered should be the complement of its input color with the complement being defined as such. Two colors are called complementary if, when mixed they produce a shade of grey. For instance, the complement of red which is RGB (255, 0, 0) is cyan which is RGB (0, 255, 255).

Primary colors and secondary colors are typically paired in this way:

- red and cyan (where cyan is the mixture of green and blue)
- green and magenta (where magenta is the mixture of red and blue)
- blue and yellow (where yellow is the mixture of red and green)

[Example:

The following represents the complement of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:comp/>
  </a:srgbClr>
</a:solidFill>
```

end example]

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_ComplementTransform](#)) is located in §A.4.1. *end note]*

20.1.2.3.8 gamma (Gamma)

This element specifies that the output color rendered by the generating application should be the sRGB gamma shift of the input color.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GammaTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.9 gray (Gray)

This element specifies a grayscale of its input color, taking into relative intensities of the red, green, and blue primaries.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_GrayscaleTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.10 green (Green)

This elements specifies the input color with the specified green component, but with its red and blue color components unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the value of the green component. The assigned value is specified as a percentage with 0% indicating minimal green and 100% indicating maximum green.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, 00, FF) to value RRGGBB= (00, FF, FF)</p> <pre><a:solidFill> <a:srgbClr val="0000FF"> <a:green val="100%"/> </a:srgbClr></pre> |

| Attributes | Description |
|------------|--|
| | <code></a:solidFill></code> <i>end example]</i> The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.11 `greenMod` (Green Modulation)

This element specifies the input color with its green component modulated by the given percentage. A 50% green modulate reduces the green component by half. A 200% green modulate doubles the green component.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | Specifies the green component as expressed by a percentage relative to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%. <i>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 80, 00)</i> <pre> <a:solidFill> <a:srgbClr val="00FF00"> <a:greenMod val="50%"/> </a:srgbClr> </a:solidFill> </pre> <i>end example]</i> The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.12 greenOff (Green Offset)

This element specifies the input color with its green component shifted, but with its red and blue color components unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the green component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the green component beyond 100%, decreases never decrease the green component below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, CC, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:greenOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.13 hslClr (Hue, Saturation, Luminance Color Model)

This element specifies a color using the HSL color model. A perceptual gamma of 2.2 is assumed.

Hue refers to the dominant wavelength of color, saturation refers to the purity of its hue, and luminance refers to its lightness or darkness.

As with all colors, colors defined with the HSL color model can have color transforms applied to it.

[*Example:*

The color blue having RGB value RRGGBB = (00, 00, 80) is equivalent to

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
```

</a:solidFill>

end example]

| Attributes | Description |
|------------------|--|
| hue (Hue) | <p>Specifies the angular value describing the wavelength. Expressed in 1/6000ths of a degree.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p> |
| lum (Luminance) | <p>Specifies the luminance referring to the lightness or darkness of the color. Expressed as a percentage with 0% referring to maximal dark (black) and 100% referring to maximal white.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |
| sat (Saturation) | <p>Specifies the saturation referring to the purity of the hue. Expressed as a percentage with 0% referring to grey, 100% referring to the purest form of the hue.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_HslColor](#)) is located in §A.4.1. *end note*]

20.1.2.3.14 hue (Hue)

This element specifies the input color with the specified hue, but with its saturation and luminance unchanged.

[Example: The following two solid fills are equivalent.

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
```

```

<a:solidFill>
  <a:hslClr hue="0" sat="100%" lum="50%">
    <a:hue val="1440000"/>
  </a:hslClr>
</a:solidFill>

```

end example]

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | Specifies the actual angle value to be used with the input color's hue component. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedAngle](#)) is located in §A.4.1. *end note*]

20.1.2.3.15 hueMod (Hue Modulate)

This element specifies the input color with its hue modulated by the given percentage. A 50% hue modulate decreases the angular hue value by half. A 200% hue modulate doubles the angular hue value.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | Specifies the opacity as expressed by a percentage relative to the input color. [Example: The following represents a green solid fill which is 50% opaque <pre> <a:solidFill> <a:srgbClr val="00FF00"> <a:alphaMod val="50%"/> </a:srgbClr> </a:solidFill> </pre> <i>end example]</i> |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositivePercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.16 hueOff (Hue Offset)

This element specifies the input color with its hue shifted, but with its saturation and luminance unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the actual angular value of the shift. The result of the shift shall be between 0 and 360 degrees. Shifts resulting in angular values less than 0 are treated as 0. Shifts resulting in angular values greater than 360 are treated as 360.</p> <p>[Example: The following increases the hue angular value by 10 degrees.</p> <pre><a:solidFill> <a:hslClr hue="0" sat="100%" lum="50%"/> <a:hueOff val="600000"/> </a:solidFill></pre> <p><i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Angle](#)) is located in §A.4.1. *end note*]

20.1.2.3.17 inv (Inverse)

This element specifies the inverse of its input color.

[Example:

The inverse of red (1, 0, 0) is cyan (0, 1, 1).

The following represents cyan, the inverse of red:

```
<a:solidFill>
  <a:srgbClr val="FF0000">
    <a:inv/>
  </a:srgbClr>
</a:solidFill>
```

end example]

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_InverseTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.18 **invGamma (Inverse Gamma)**

This element specifies that the output color rendered by the generating application should be the inverse sRGB gamma shift of the input color.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_InverseGammaTransform](#)) is located in §A.4.1. *end note*]

20.1.2.3.19 **lum (Luminance)**

This element specifies the input color with the specified luminance, but with its hue and saturation unchanged. Typically luminance values fall in the range [0%, 100%].

[Example:

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
```

```

<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="0%">
    <a:lum val="50%"/>
  <a:hslClr/>
</a:solidFill>

```

end example]

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the value of the luminance. The assigned value is specified as a percentage with 0% indicating minimal luminance and 100% indicating maximum luminance.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 66, 00)</p> <pre> <a:solidFill> <a:srgbClr val="00FF00"> <a:lum val="20%"/> </a:srgbClr> </a:solidFill> </pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.20 lumMod (Luminance Modulation)

This element specifies the input color with its luminance modulated by the given percentage. A 50% luminance modulate reduces the luminance by half. A 200% luminance modulate doubles the luminance.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the luminance as expressed by a percentage relative to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 75, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:lumMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.21 lumOff (Luminance Offset)

This element specifies the input color with its luminance shifted, but with its hue and saturation unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the luminance as expressed by a percentage offset increase or decrease to the input color. Increases never increase the luminance beyond 100%, decreases never decrease the luminance below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, 99, 00)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:lumOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.22 prstClr (Preset Color)

This element specifies a color which is bound to one of a predefined collection of colors.

[Example:

The following defines a solid fill bound to the "black" preset color.

```
<a:solidFill>
  <a:prstClr val="black">
</a:solidFill>
```

end example]

| Attributes | Description |
|------------|--|
| | <pre><a:srgbClr val="FF0000"> <a:redMod val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.25 redOff (Red Offset)

This element specifies the input color with its red component shifted, but with its green and blue color components unchanged.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | <p>Specifies the red component as expressed by a percentage offset increase or decrease to the input color component. Increases never increase the red component beyond 100%, decreases never decrease the red component below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (FF, 00, 00) to value RRGGBB= (CC, 00, 00)</p> <pre><a:solidFill> <a:srgbClr val="FF0000"> <a:redOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note: The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.*
end note]

20.1.2.3.26 **sat** (Saturation)

This element specifies the input color with the specified saturation, but with its hue and luminance unchanged. Typically saturation values fall in the range [0%, 100%].

[*Example:*

The following two solid fills are equivalent:

```
<a:solidFill>
  <a:hslClr hue="14400000" sat="100%" lum="50%">
</a:solidFill>
<a:solidFill>
  <a:hslClr hue="14400000" sat="0%" lum="50%">
    <a:sat val="100000"/>
  <a:hslClr/>
</a:solidFill>
```

end example]

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the value of the saturation. The assigned value is specified as a percentage with 0% indicating minimal saturation and 100% indicating maximum saturation.</p> <p>[<i>Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (40, C0, 40)</i></p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:sat val="50%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.27 **satMod (Saturation Modulation)**

This element specifies the input color with its saturation modulated by the given percentage. A 50% saturation modulate reduces the saturation by half. A 200% saturation modulate doubles the saturation.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the saturation as expressed by a percentage relative to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.</p> <p>[Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (66, 99, 66)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:satMod val="20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.28 **satOff (Saturation Offset)**

This element specifies the input color with its saturation shifted, but with its hue and luminance unchanged. A 10% offset to 20% saturation yields 30% saturation.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|--|
| val (Value) | <p>Specifies the saturation as expressed by a percentage offset increase or decrease to the input color. Increases never increase the saturation beyond 100%, decreases never decrease the saturation below 0%.</p> <p>[<i>Example:</i> The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (19, E5, 19)</p> <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:satOff val="-20%"/> </a:srgbClr> </a:solidFill></pre> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Percentage](#)) is located in §A.4.1.
end note]

20.1.2.3.29 schemeClr (Scheme Color)

This element specifies a color bound to a user's theme. As with all elements which define a color, it is possible to apply a list of color transforms to the base color defined.

| Parent Elements |
|--|
| accent1 (§20.1.4.1.1); accent2 (§20.1.4.1.2); accent3 (§20.1.4.1.3); accent4 (§20.1.4.1.4); accent5 (§20.1.4.1.5); accent6 (§20.1.4.1.6); alphaInv (§20.1.8.4); bgClr (§20.1.8.10); bgRef (§19.3.1.3); buClr (§21.1.2.4.4); clrFrom (§20.1.8.17); clrMru (§19.2.1.4); clrRepl (§20.1.8.18); clrTo (§20.1.8.19); clrVal (§19.5.27); contourClr (§20.1.5.6); custClr (§20.1.4.1.8); dk1 (§20.1.4.1.9); dk2 (§20.1.4.1.10); duotone (§20.1.8.23); effectClrLst (§21.4.4.7); effectRef (§20.1.4.2.8); extrusionClr (§20.1.5.7); fgClr (§20.1.8.27); fillClrLst (§21.4.4.8); fillRef (§20.1.4.2.10); folHlink (§20.1.4.1.15); fontRef (§20.1.4.1.17); from (§19.5.43); glow (§20.1.8.32); gs (§20.1.8.36); highlight (§21.1.2.3.4); hlink (§20.1.4.1.19); innerShdw (§20.1.8.40); linClrLst (§21.4.4.9); lnRef (§20.1.4.2.19); lt1 (§20.1.4.1.22); lt2 (§20.1.4.1.23); outerShdw (§20.1.8.45); penClr (§19.2.1.23); prstShdw (§20.1.8.49); solidFill (§20.1.8.54); tcTxStyle (§20.1.4.2.30); to (§19.5.90); txEffectClrLst (§21.4.4.12); txFillClrLst (§21.4.4.13); txLinClrLst (§21.4.4.14) |

[Note: The W3C XML Schema definition of this element's content model ([CT_SchemeColor](#)) is located in §A.4.1. end note]

20.1.2.3.30 **scrgbClr** (RGB Color Model - Percentage Variant)

This element specifies a color using the red, green, blue RGB color model. Each component, red, green, and blue is expressed as a percentage from 0% to 100%. A linear gamma of 1.0 is assumed.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[Example: The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%" />
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC" />
</a:solidFill>
```

end example]

| g (Green) | <p>Specifies the percentage of green.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |

| Attributes | Description |
|------------|--|
| r (Red) | Specifies the percentage of red. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ScRgbColor](#)) is located in §A.4.1. *end note*]

20.1.2.3.31 shade (Shade)

This element specifies a darker version of its input color. A 10% shade is 10% of the input color combined with 90% black.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | Specifies the shade as expressed by a percentage value. [Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (00, BC, 00) <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:shade val="50%"/> </a:srgbClr> </a:solidFill></pre> <i>end example</i> The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.2.3.32 srgbClr (RGB Color Model - Hex Variant)

This element specifies a color using the red, green, blue RGB color model. Red, green, and blue is expressed as sequence of hex digits, RRGGBB. A perceptual gamma of 2.2 is used.

Specifies the level of red as expressed by a percentage offset increase or decrease relative to the input color.

[*Example:* The following represent the same color

```
<a:solidFill>
  <a:scrgbClr r="50%" g="50%" b="50%" />
</a:solidFill>
<a:solidFill>
  <a:srgbClr val="BCBCBC" />
</a:solidFill>
```

end example]

| shade (Shade) | §20.1.2.3.31 |
| tint (Tint) | §20.1.2.3.34 |

| Attributes | Description |
|----------------------|--|
| lastClr (Last Color) | Specifies the color value that was last computed by the generating application. The possible values for this attribute are defined by the ST_HexColorRGB simple type (§22.9.2.5). |
| val (Value) | Specifies the system color value. The possible values for this attribute are defined by the ST_SystemColorVal simple type (§20.1.10.57). |

[Note: The W3C XML Schema definition of this element's content model ([CT_SystemColor](#)) is located in §A.4.1. *end note*]

20.1.2.3.34 tint (Tint)

This element specifies a lighter version of its input color. A 10% tint is 10% of the input color combined with 90% white.

| Parent Elements |
|---|
| hslClr (§20.1.2.3.13); prstClr (§20.1.2.3.22); schemeClr (§20.1.2.3.29); scrgbClr (§20.1.2.3.30); srgbClr (§20.1.2.3.32); sysClr (§20.1.2.3.33) |

| Attributes | Description |
|-------------|---|
| val (Value) | Specifies the tint as expressed by a percentage value. [Example: The following manipulates the fill from having RGB value RRGGBB = (00, FF, 00) to value RRGGBB= (BC, FF, BC) <pre><a:solidFill> <a:srgbClr val="00FF00"> <a:tint val="50%"/> </a:srgbClr> </a:solidFill></pre> <i>end example</i> The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PositiveFixedPercentage](#)) is located in §A.4.1. *end note*]

20.1.3 Audio and Video

The Audio and Video portion of the DrawingML framework deals with all media of these two kinds that can be attached to objects within a document. Types of audio that can be represented within a file are CD audio, QuickTime audio, and any other generic audio. When dealing with generic audio there is the option for embedding it within the file and also linking it. The linking option is preferable if the size of the audio file is too large and thus increases the size of the document by an undesirable amount. For video there are two kinds that can be represented and that is either a QuickTime movie or any other generic movie. When dealing with generic video there is only the option of linking to the media as video is too large to embed within a document.

20.1.3.1 audioCd (Audio from CD)

This element specifies the existence of Audio from a CD. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the sound however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has an audio from a CD attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioCd>
        <a:st track="1"/>
        <a:end track="3" time="65"/>
      </a:audioCd>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single audioCD element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioCD element from within the timing node list. For this example we see that the audio for this CD starts playing at the 0 second mark on the first track and ends on the 1 minute 5 second mark of the third track. *end example*]

| Parent Elements |
|-----------------------------------|
| nvPr (§19.3.1.33) |

| Child Elements | Subclause |
|-------------------------|--------------|
| end (Audio End Time) | §20.1.3.3 |
| extLst (Extension List) | §20.1.2.2.15 |
| st (Audio Start Time) | §20.1.3.5 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AudioCD](#)) is located in §A.4.1. *end note*]

20.1.3.2 audioFile (Audio from File)

This element specifies the existence of an audio file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example:* Consider the following picture object that has an audio file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:audioFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single audioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this audioFile element from within the timing node list. The Linked relationship id is used to retrieve the actual audio file for playback purposes. *end example*]

| Parent Elements |
|-------------------|
| nvPr (§19.3.1.33) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|---|---|
| contentType (Content Type of Linked Audio File) | <p>Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [<i>Note: A list of suggested audio types is provided in §15.2.2. end note</i>]</p> <p>If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship's target.</p> <p>A producer that wants interoperability should use the following standard format:</p> <ul style="list-style-type: none">• audio/mpeg ISO/IEC 11172-3 <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | <p>Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p> |

[*Note: The W3C XML Schema definition of this element's content model ([CT_AudioFile](#)) is located in §A.4.1. end note*]

20.1.3.3 end (Audio End Time)

This element specifies the end point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should halt its playback. This element is used in conjunction with an Audio Start Time element to specify the time span for an entire audioCD sound element.

[*Example: Consider the following DrawingML.*

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*]

| Parent Elements |
|---------------------|
| audioCd (§20.1.3.1) |

| Attributes | Description |
|---------------|---|
| time (Time) | Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| track (Track) | Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype. |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AudioCDTime](#)) is located in §A.4.1. *end note*]

20.1.3.4 quickTimeFile (QuickTime from File)

This element specifies the existence of a QuickTime file, as defined in the 2007-09-04 version of the QuickTime File Format Specification: <http://developer.apple.com/documentation/QuickTime/QTFF/qtff.pdf>. [*Note:* For more information on the QuickTime format: <http://developer.apple.com/reference/QuickTime/>. *end note*]. This element is specified within the non-visual properties of an object. The QuickTime file shall be attached to an object as this is how it is represented within the document. The actual playing of the QuickTime however is done within the timing node list that is specified under the timing element.

[*Example:* Consider the following picture object that has a QuickTime file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
```

```
<p:nvPr>
  <a:quickTimeFile r:link="rId1"/>
</p:nvPr>
</p:nvPicPr>
...
</p:pic>
```

In the above example, we see that there is a single quickTimeFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this quickTimeFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. *end example*]

| Parent Elements |
|-----------------------------------|
| nvPr (§19.3.1.33) |

| Child Elements | Subclause |
|---|------------------------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|---|--|
| link (Linked Relationship ID) | Specifies the identification information for a linked object. This attribute is used to specify the location of an object that does not reside within this file. |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_QuickTimeFile](#)) is located in §A.4.1. *end note*]

20.1.3.5 [st \(Audio Start Time\)](#)

This element specifies the start point for a CD Audio sound element. Encompassed within this element are the time and track at which the sound should begin its playback. This element is used in conjunction with an Audio End Time element to specify the time span for an entire audioCD sound element.

[*Example:* Consider the following DrawingML.

```
<a:audioCd>
  <a:st track="1" time="2"/>
  <a:end track="3" time="65"/>
</a:audioCd>
```

In the above example, the audioCD sound element shown specifies for a portion of audio spanning from 2 seconds into the first track to 1 minute, 5 seconds into the third track. *end example*

| Parent Elements |
|---------------------|
| audioCd (§20.1.3.1) |

| Attributes | Description |
|---------------|---|
| time (Time) | Specifies the time in seconds that the CD Audio should be started at. If this attribute is omitted, then a value of 0 is assumed. The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype. |
| track (Track) | Specifies which track of the CD this Audio begins playing on. This attribute is required and cannot be omitted. The possible values for this attribute are defined by the W3C XML Schema unsignedByte datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_AudioCDTime](#)) is located in §A.4.1. *end note*]

20.1.3.6 videoFile (Video from File)

This element specifies the existence of a video file. This element is specified within the non-visual properties of an object. The video shall be attached to an object as this is how it is represented within the document. The actual playing of the video however is done within the timing node list that is specified under the timing element.

[Example: Consider the following picture object that has a video attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
```

```

    <p:nvPr>
      <a:videoFile r:link="rId1"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>

```

In the above example, we see that there is a single videoFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this videoFile element from within the timing node list. The Linked relationship id is used to retrieve the actual video file for playback purposes. *end example*]

| Parent Elements |
|-------------------|
| nvPr (§19.3.1.33) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|--|--|
| contentType (Content Type of Linked Video File) | <p>Specifies the content type for the external file that is referenced by this element. Content types define a media type, a subtype, and an optional set of parameters, as defined in Part 2. If a rendering application cannot process external content of the content type specified, then the specified content can be ignored. [<i>Note</i>: A list of suggested video types is provided in §15.2.17. <i>end note</i>]</p> <p>If this attribute is omitted, application should attempt to determine the content type by reading the contents of the relationship's target.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |
| link (Linked Relationship ID) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | <p>Specifies the identification information for a linked video file. This attribute is used to specify the location of an object that does not reside within this file.</p> <p>The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1).</p> |

[*Note*: The W3C XML Schema definition of this element's content model (CT_VideoFile) is located in §A.4.1. *end note*]

20.1.3.7 wavAudioFile (Audio from WAV File)

This element specifies the existence of an audio WAV file. This element is specified within the non-visual properties of an object. The audio shall be attached to an object as this is how it is represented within the document. The actual playing of the audio however is done within the timing node list that is specified under the timing element.

[*Example:* Consider the following picture object that has an audio WAV file attached to it.

```
<p:pic>
  <p:nvPicPr>
    <p:cNvPr id="7" name="Rectangle 6">
      <a:hlinkClick r:id="" action="ppaction://media"/>
    </p:cNvPr>
    <p:cNvPicPr>
      <a:picLocks noRot="1"/>
    </p:cNvPicPr>
    <p:nvPr>
      <a:wavAudioFile r:embed="rId2"/>
    </p:nvPr>
  </p:nvPicPr>
  ...
</p:pic>
```

In the above example, we see that there is a single wavAudioFile element attached to this picture. This picture is placed within the document just as a normal picture or shape would be. The id of this picture, namely 7 in this case, is used to refer to this wavAudioFile element from within the timing node list. The Embedded relationship id is used to retrieve the actual audio file for playback purposes. *end example*]

[*Note:* This element is generally used for the purposes of embedding audio files within the document. For linking to generic audio files the audioFile element should be used. *end note*]

| Parent Elements |
|-------------------|
| nvPr (§19.3.1.33) |

| Attributes | Description |
|---|---|
| embed (Embedded Audio File Relationship ID) | Specifies the identification information for an embedded audio file. This attribute is used to specify the location of an object that resides locally within the file. [<i>Note:</i> A list of suggested audio types is provided in §15.2.2. <i>end note</i>] |
| Namespace: http://purl.oclc.org/ooxml/officeDocument/relationshi | The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

| Attributes | Description |
|-------------------|--|
| ps | |
| name (Sound Name) | <p>Specifies the original name or given short name for the corresponding sound. This is used to distinguish this sound from others by providing a human readable name for the attached sound should the user need to identify the sound among others within the UI.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EmbeddedWAVAudioFile](#)) is located in §A.4.1. *end note*]

20.1.4 Styles

Styles within DrawingML refer to the way a particular object (be it text or a shape, or anything else) is formatted. Different aspects, ranging from color, line type, fill, and effects applied to the object can be predefined within a theme. The main purpose of a theme is to define a style matrix from which a document can pull style information from in order to format the visual look of objects in a document.

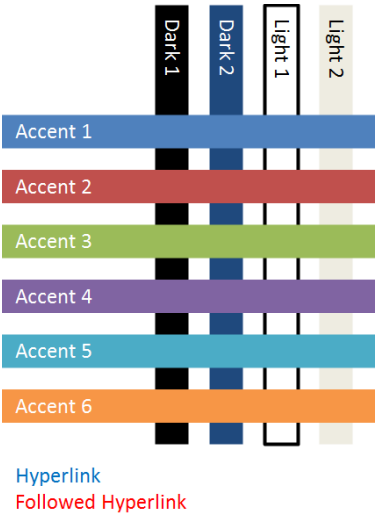

20.1.4.1 Styles

The elements in this section compose the basic definition of a style, including its associated colors, effect styles, line styles, fill styles, background styles, and font scheme.

20.1.4.1.1 accent1 (Accent 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[Note: The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.2 accent2 (Accent 2)

This element defines a color that happens to be the accent 2 color. The set of twelve colors come together to form the color scheme for a theme.

[Example: Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

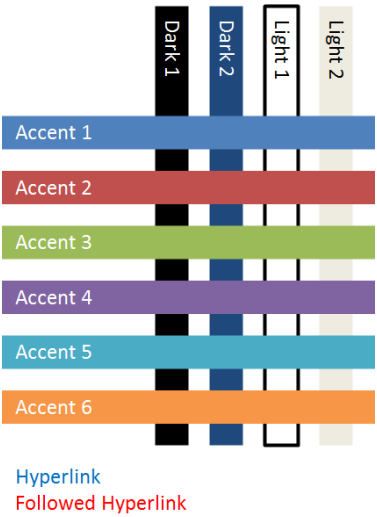

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note*: The W3C XML Schema definition of this element’s content model (CT Color) is located in §A.4.1. *end note*]

20.1.4.1.3 **accent3** (Accent 3)

This element defines a color that happens to be the accent 3 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |

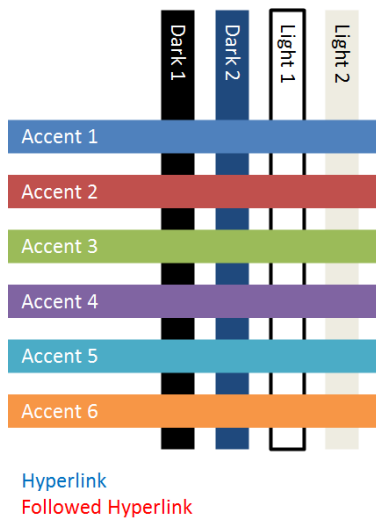

| Child Elements | Subclause |
|---|--------------|
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.4 accent4 (Accent 4)

This element defines a color that happens to be the accent 4 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |

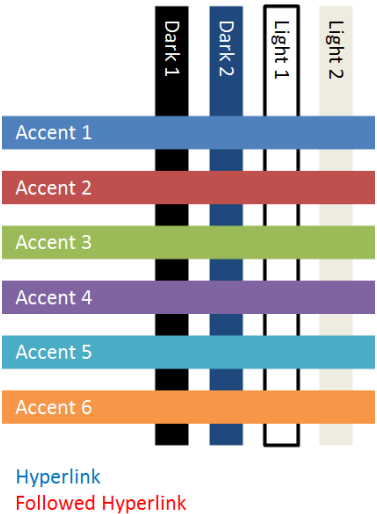

| Child Elements | Subclause |
|---|--------------|
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note*: The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.5 **accent5** (Accent 5)

This element defines a color that happens to be the accent 5 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |

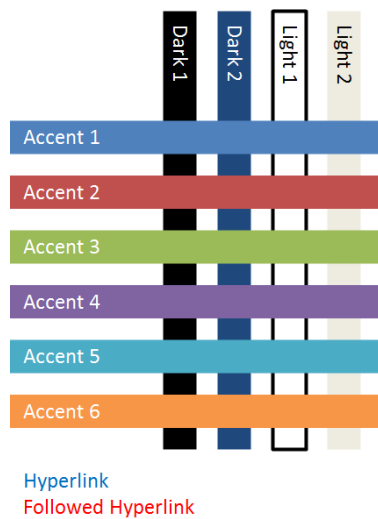

| Child Elements | Subclause |
|-----------------------|--------------|
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model (CT_Color) is located in §A.4.1. *end note*]

20.1.4.1.6 accent6 (Accent 6)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.4.1.7 **bgFillStyleLst (Background Fill Style List)**

This element defines a list of background fills that are used within a theme. The background fills consist of three fills, arranged in order from subtle to moderate to intense.

[*Example:* Consider the following example of a background fill style list within DrawingML:

```
<bgFillStyleLst>
  <solidFill>
...
  </solidFill>
  <gradFill rotWithShape="1">
...
  </gradFill>
  <blipFill>
...
  </blipFill>
</bgFillStyleLst>
```

In this example, we see that the list contains a solid fill for the subtle fill, a gradient fill for the moderate fill and an image fill for the intense background fill. *end example*]

| Parent Elements |
|--------------------------|
| fmtScheme (§20.1.4.1.14) |

| Child Elements | Subclause |
|--------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_BackgroundFillStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.8 `custClr` (Custom color)

This element defines a custom color. The custom colors are used within a custom color list to define custom colors that are extra colors that can be appended to a theme. This is useful within corporate scenarios where there is a set corporate color palette from which to work.

| Parent Elements |
|-------------------------------------|
| <code>custClrLst</code> (§20.1.6.3) |

| Child Elements | Subclause |
|--|--------------|
| <code>hslClr</code> (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| <code>prstClr</code> (Preset Color) | §20.1.2.3.22 |
| <code>schemeClr</code> (Scheme Color) | §20.1.2.3.29 |
| <code>scrgbClr</code> (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| <code>srgbClr</code> (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| <code>sysClr</code> (System Color) | §20.1.2.3.33 |

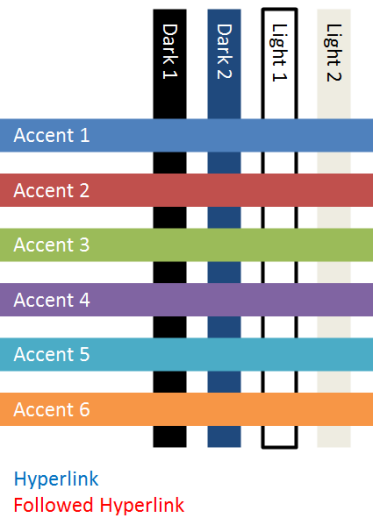

| Attributes | Description |
|--------------------------|--|
| <code>name</code> (Name) | <p>The name of the color shown in the color picker.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT CustomColor](#)) is located in §A.4.1.
end note]

20.1.4.1.9 `dk1` (Dark 1)

This element defines a color that happens to be the dark 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

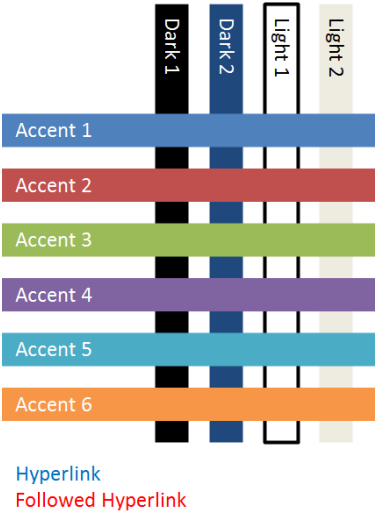

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.10 dk2 (Dark 2)

This element defines a color that happens to be the dark 2 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

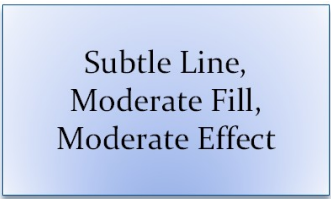

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.11 effectStyle (Effect Style)

This element defines a set of effects and 3D properties that can be applied to an object.

[*Example:* Consider the following example of an effect style within DrawingML:

```
<effectStyle>
  <effectLst>
    <outerShdw blurRad="57150" dist="38100" dir="5400000" align="ctr"
      rotWithShape="0">
      <schemeClr val="phClr">
        <shade val="9000"/>
        <satMod val="105000"/>
        <alpha val="48000"/>
      </schemeClr>
    </outerShdw>
  </effectLst>
</effectStyle>
```

In this example, an outer shadow is being applied to a shape as the moderate effect. *end example*]

| Parent Elements |
|-------------------------------|
| effectStyleLst (§20.1.4.1.12) |

| Child Elements | Subclause |
|----------------------------------|--------------|
| effectDag (Effect Container) | §20.1.8.25 |
| effectLst (Effect Container) | §20.1.8.26 |
| scene3d (3D Scene Properties) | §20.1.4.1.26 |
| sp3d (Apply 3D shape properties) | §20.1.5.12 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EffectStyleItem](#)) is located in §A.4.1. *end note*]

20.1.4.1.12 effectStyleLst (Effect Style List)

This element defines a set of three effect styles that create the effect style list for a theme. The effect styles are arranged in order of subtle to moderate to intense.

[*Example:* Consider the following example of an effect style list within DrawingML:

```

<effectStyleLst>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
...
      </outerShdw>
    </effectLst>
  </effectStyle>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
...
      </outerShdw>
    </effectLst>
  </effectStyle>
  <effectStyle>
    <effectLst>
      <outerShdw blurRad="57150" dist="38100" dir="5400000"
        algn="ctr" rotWithShape="0">
...
      </outerShdw>
    </effectLst>
  <scene3d>
...
  </scene3d>
  <sp3d prstMaterial="powder">
...
  </sp3d>
</effectStyle>
</effectStyleLst>

```

In this example, we see three effect styles defined. The first two (subtle and moderate) define an outer shadow as the effect, while the third effect style (intense) defines an outer shadow along with 3D properties which are to be applied to the object as well. *end example*]

| Parent Elements |
|--------------------------|
| fmtScheme (§20.1.4.1.14) |

| Child Elements | Subclause |
|----------------------------|--------------|
| effectStyle (Effect Style) | §20.1.4.1.11 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT EffectStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.13 fillStyleLst (Fill Style List)

This element defines a set of three fill styles that are used within a theme. The three fill styles are arranged in order from subtle to moderate to intense.

[*Example:* Consider the following example of a fill style list within DrawingML:

```
<fillStyleLst>
  <solidFill>
...
  </solidFill>
  <gradFill rotWithShape="1">
...
  </gradFill>
  <gradFill rotWithShape="1">
...
  </gradFill>
</fillStyleLst>
```

In this example, we see three fill styles being defined within the fill style list. The first style is the subtle style and defines simply a solid fill. The second and third styles (moderate and intense fills respectively) define gradient fills. *end example*]

| Parent Elements |
|--------------------------|
| fmtScheme (§20.1.4.1.14) |

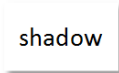

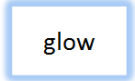

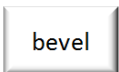

| Child Elements | Subclause |
|--------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

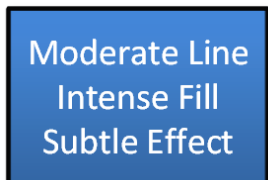

[*Note:* The W3C XML Schema definition of this element’s content model ([CT FillStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.14 `fmtScheme` (Format Scheme)

This element contains the background fill styles, effect styles, fill styles, and line styles which define the style matrix for a theme. The style matrix consists of subtle, moderate, and intense fills, lines, and effects. The background fills are not generally thought of to directly be associated with the matrix, but do play a role in the style of the overall document. Usually, a given object chooses a single line style, a single fill style, and a single effect style in order to define the overall final look of the object.

[*Example:* Consider the following example of the style matrix in use within DrawingML:

| | Line | Fill | Effect |
|----------|--|--|--|
| Subtle |  |  |  |
| Moderate |  |  |  |
| Intense |  |  |  |

In this example, we see a shape styled which utilizes different aspects from the above defined style matrix. *end example]*

| Parent Elements |
|--|
| themeElements (§20.1.6.10); themeOverride (§20.1.6.12) |

| Child Elements | Subclause |
|---|--------------|
| bgFillStyleLst (Background Fill Style List) | §20.1.4.1.7 |
| effectStyleLst (Effect Style List) | §20.1.4.1.12 |
| fillStyleLst (Fill Style List) | §20.1.4.1.13 |
| lnStyleLst (Line Style List) | §20.1.4.1.21 |

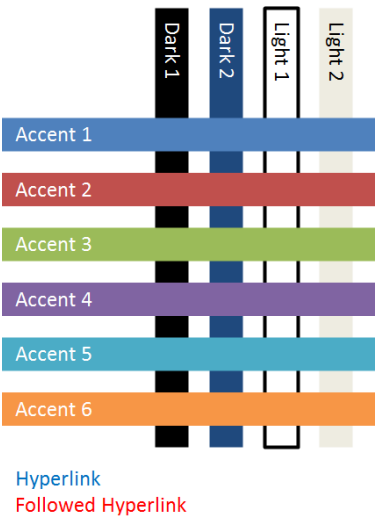

| Attributes | Description |
|-------------|---|
| name (Name) | Defines the name for the format scheme. The name is simply a human readable string which identifies the format scheme in the user interface. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_StyleMatrix](#)) is located in §A.4.1.
end note]

20.1.4.1.15 folHlink (Followed Hyperlink)

This element defines a color that happens to be the followed hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example*: Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |

| Child Elements | Subclause |
|---|--------------|
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.4.1.16 font (Font)

This element defines a font within the styles area of DrawingML. A font is defined by a script along with a typeface.

[*Example:* Consider the following example of a font in DrawingML:

```
<font script="Thai" typeface="Cordia New"/>
```

In this example, we see that the script 'Thai' is supposed to use the font face 'Cordia New'. *end example*]

| Parent Elements |
|---|
| font (§20.1.4.2.13); majorFont (§20.1.4.1.24); minorFont (§20.1.4.1.25) |

| Attributes | Description |
|---------------------|---|
| script (Script) | Specifies the script, or language, in which the typeface is supposed to be used. The possible values for this attribute are defined by the W3C XML Schema string datatype. |
| typeface (Typeface) | Specifies the font face to use. The possible values for this attribute are defined by the ST_TextTypeface simple type (§20.1.10.80). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SupplementalFont](#)) is located in §A.4.1. *end note*]

20.1.4.1.17 fontRef (Font Reference)

This element represents a reference to a themed font. When used it specifies which themed font to use along with a choice of color.

[*Example:* Consider the following example of a font reference within DrawingML:

```
<fontRef idx="minor">
  <schemeClr val="tx1"/>
</fontRef>
```

In this example, we see a font referencing the minor font defined within the theme. *end example]*

| Parent Elements |
|--|
| style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tcTxStyle (§20.1.4.2.30) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|------------------|---|
| idx (Identifier) | Specifies the identifier of the font to reference. The possible values for this attribute are defined by the ST_FontCollectionIndex simple type (§20.1.10.25). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_FontReference](#)) is located in §A.4.1. *end note]*

20.1.4.1.18 fontScheme (Font Scheme)

This element defines the font scheme within the theme. The font scheme consists of a pair of major and minor fonts for which to use in a document. The major font corresponds well with the heading areas of a document, and the minor font corresponds well with the normal text or paragraph areas.

[Example: Consider the following example of a font scheme within DrawingML:

```
<fontScheme name="sample">
  <majorFont>
...
  </majorFont>
```

```

    <minorFont>
...
    </minorFont>
</fontScheme>

```

In this example, we see the major and minor font lists within the font scheme that is named 'sample'. *end example]*

| Parent Elements |
|--|
| themeElements (§20.1.6.10); themeOverride (§20.1.6.12) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| majorFont (Major Font) | §20.1.4.1.24 |
| minorFont (Minor fonts) | §20.1.4.1.25 |

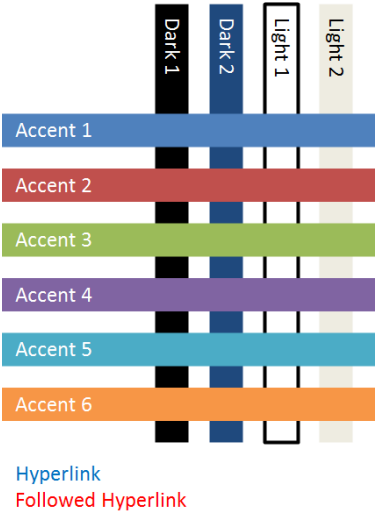

| Attributes | Description |
|-------------|--|
| name (Name) | <p>The name of the font scheme shown in the user interface.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontScheme](#)) is located in §A.4.1. *end note]*

20.1.4.1.19 hlink (Hyperlink)

This element defines a color that happens to be the hyperlink color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.20 InDef (Line Default)

This element defines a default line that is used within a document.

[*Example:* Consider the following example of a default line defined in DrawingML:

```
<InDef>
  <spPr/>
  <bodyPr/>
  <lstStyle/>
```

```

<style>
  <lnRef idx="1">
    <schemeClr val="accent2"/>
  </lnRef>
  <fillRef idx="0">
    <schemeClr val="accent2"/>
  </fillRef>
  <effectRef idx="0">
    <schemeClr val="accent2"/>
  </effectRef>
  <fontRef idx="minor">
    <schemeClr val="tx1"/>
  </fontRef>
</style>
</lnDef>

```

In this example, we see that the default line for the document is being defined as a themed line which references the subtle line style with idx equal to 1. *end example*]

| Parent Elements |
|----------------------------|
| objectDefaults (§20.1.6.7) |

| Child Elements | Subclause |
|-----------------------------|--------------|
| bodyPr (Body Properties) | §21.1.2.1.1 |
| extLst (Extension List) | §20.1.2.2.15 |
| lstStyle (Text List Styles) | §21.1.2.4.12 |
| spPr (Shape Properties) | §20.1.2.2.35 |
| style (Shape Style) | §20.1.2.2.37 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.1.21 lnStyleLst (Line Style List)

This element defines a list of three line styles for use within a theme. The three line styles are arranged in order from subtle to moderate to intense versions of lines. This list makes up part of the style matrix.

[*Example:* Consider the following example of a line style list within DrawingML:

```
<lnStyleLst>
  <ln w="9525" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr">
        <shade val="50000"/>
        <satMod val="103000"/>
      </schemeClr>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="25400" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
  <ln w="38100" cap="flat" cmpd="sng" algn="ctr">
    <solidFill>
      <schemeClr val="phClr"/>
    </solidFill>
    <prstDash val="solid"/>
  </ln>
</lnStyleLst>
```

In this example, we see three lines defined within a line style list. The first line corresponds to the subtle line, the second to the moderate, and the third corresponds to the intense line defined in the theme. *end example*]

| Parent Elements |
|--------------------------|
| fmtScheme (§20.1.4.1.14) |

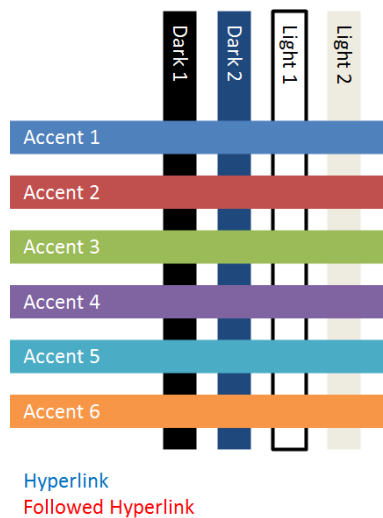

| Child Elements | Subclause |
|----------------|--------------|
| ln (Outline) | §20.1.2.2.24 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_LineStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.1.22 lt1 (Light 1)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

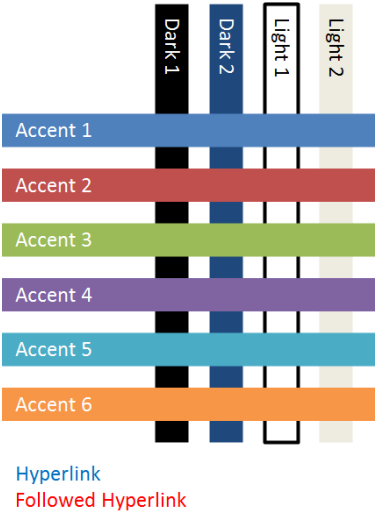

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.23 lt2 (Light 2)

This element defines a color that happens to be the accent 1 color. The set of twelve colors come together to form the color scheme for a theme.

[*Example:* Consider the following example of a set of colors that form a color scheme:

end example]

| Parent Elements |
|-----------------------|
| clrScheme (§20.1.6.2) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note]*

20.1.4.1.24 **majorFont (Major Font)**

This element defines the set of major fonts which are to be used under different languages or locals.

[*Example:* Consider the following example of the major fonts being defined within DrawingML:

```

<majorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="MS Pゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</majorFont>

```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*

| Parent Elements |
|---------------------------|
| fontScheme (§20.1.4.1.18) |

| Child Elements | Subclause |
|--------------------------|--------------|
| cs (Complex Script Font) | §21.1.2.3.1 |
| ea (East Asian Font) | §21.1.2.3.3 |
| extLst (Extension List) | §20.1.2.2.15 |
| font (Font) | §20.1.4.1.16 |
| latin (Latin Font) | §21.1.2.3.7 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.1.25 minorFont (Minor fonts)

This element defines the set of minor fonts that are to be used under different languages or locals.

[*Example:* Consider the following example of the minor fonts being defined within DrawingML:

```
<minorFont>
  <latin typeface="Calibri"/>
  <ea typeface="Arial"/>
  <cs typeface="Arial"/>
  <font script="Jpan" typeface="MS Pゴシック"/>
  <font script="Hang" typeface="HY중고딕"/>
  <font script="Hans" typeface="隶书"/>
  <font script="Hant" typeface="微軟黑體"/>
  <font script="Arab" typeface="Traditional Arabic"/>
  <font script="Hebr" typeface="Arial"/>
  <font script="Thai" typeface="Cordia New"/>
  <font script="Ethi" typeface="Nyala"/>
  <font script="Beng" typeface="Vrinda"/>
  <font script="Gujr" typeface="Shruti"/>
  <font script="Khmr" typeface="DaunPenh"/>
  <font script="Knda" typeface="Tunga"/>
</minorFont>
```

In this example, we see the latin, east asian, and complex script fonts defined along with many fonts for different locals. *end example*]

| Parent Elements |
|---------------------------|
| fontScheme (§20.1.4.1.18) |

| Child Elements | Subclause |
|--------------------------|--------------|
| cs (Complex Script Font) | §21.1.2.3.1 |
| ea (East Asian Font) | §21.1.2.3.3 |
| extLst (Extension List) | §20.1.2.2.15 |
| font (Font) | §20.1.4.1.16 |
| latin (Latin Font) | §21.1.2.3.7 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.1.26 scene3d (3D Scene Properties)

This element defines optional scene-level 3D properties to apply to an object.

| Parent Elements |
|---|
| bodyPr (§21.1.2.1.1); effectStyle (§20.1.4.1.11); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr |

| Parent Elements |
|--|
| (§20.5.2.18); grpSpPr (§19.3.1.23); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44) |

| Child Elements | Subclause |
|---------------------------|--------------|
| backdrop (Backdrop Plane) | §20.1.5.2 |
| camera (Camera) | §20.1.5.5 |
| extLst (Extension List) | §20.1.2.2.15 |
| lightRig (Light Rig) | §20.1.5.9 |

[Note: The W3C XML Schema definition of this element's content model ([CT_Scene3D](#)) is located in §A.4.1. *end note*]

20.1.4.1.27 spDef (Shape Default)

This element defines the formatting that is associated with the default shape. The default formatting can be applied to a shape when it is initially inserted into a document.

[Example: Consider the following example of a shape default being used within DrawingML:

```
<spDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
  <lstStyle>
    <defPPr align="ctr">
      <defRPr/>
    </defPPr>
  </lstStyle>
  <style>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
    <fillRef idx="2">
      <schemeClr val="accent1"/>
    </fillRef>
  </style>
</spDef>
```

```
<effectRef idx="1">
  <schemeClr val="accent1"/>
</effectRef>
<fontRef idx="minor">
  <schemeClr val="dk1"/>
</fontRef>
</style>
</spDef>
```

In this example, we see a default shape which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

| Parent Elements |
|----------------------------|
| objectDefaults (§20.1.6.7) |

| Child Elements | Subclause |
|-----------------------------|--------------|
| bodyPr (Body Properties) | §21.1.2.1.1 |
| extLst (Extension List) | §20.1.2.2.15 |
| lstStyle (Text List Styles) | §21.1.2.4.12 |
| spPr (Shape Properties) | §20.1.2.2.35 |
| style (Shape Style) | §20.1.2.2.37 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.1.28 txDef (Text Default)

This element defines the default formatting which is applied to text in a document by default. The default formatting can and should be applied to the shape when it is initially inserted into a document.

[*Example:* Consider the following example of a text default being used within DrawingML:

```
<txDef>
  <spPr>
    <solidFill>
      <schemeClr val="accent2">
        <shade val="75000"/>
      </schemeClr>
    </solidFill>
  </spPr>
  <bodyPr rtlCol="0" anchor="ctr"/>
```

```

<lstStyle>
  <defPPr align="ctr">
    <defRPr/>
  </defPPr>
</lstStyle>
<style>
  <lnRef idx="1">
    <schemeClr val="accent1"/>
  </lnRef>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
  <fontRef idx="minor">
    <schemeClr val="dk1"/>
  </fontRef>
</style>
</txDef>

```

In this example, we see a default text which references a certain themed fill, line, effect, and font along with an override fill to these. *end example*]

| Parent Elements |
|----------------------------|
| objectDefaults (§20.1.6.7) |

| Child Elements | Subclause |
|-----------------------------|--------------|
| bodyPr (Body Properties) | §21.1.2.1.1 |
| extLst (Extension List) | §20.1.2.2.15 |
| lstStyle (Text List Styles) | §21.1.2.4.12 |
| spPr (Shape Properties) | §20.1.2.2.35 |
| style (Shape Style) | §20.1.2.2.37 |

[Note: The W3C XML Schema definition of this element's content model ([CT_DefaultShapeDefinition](#)) is located in §A.4.1. *end note*]

20.1.4.2 Table Styles

Table styles are responsible for the rapid formatting that can be applied to a table. This rapid formatting takes different parts of a table into account, such as if the first row or last row should be emphasized, or if there is

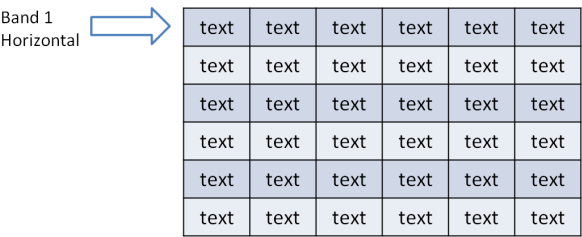

some type of banding (row for example) present on the table. All of these different types of formatting can be defined within a table style

20.1.4.2.1 band1H (Band 1 Horizontal)

This element describes the formatting for the first row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 1 horizontal being used within DrawingML:

```
<band1H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1H>
```

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example]*

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[Note: The W3C XML Schema definition of this element’s content model (CT TablePartStyle) is located in §A.4.1. *end note]*

20.1.4.2.2 band1V (Band 1 Vertical)

This element describes the formatting for the first row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 1 vertical being used within DrawingML:

```
<band1V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band1V>
```

Band 1 Vertical

| | | | | | |
|------|------|------|------|------|------|
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |

In this example, we set the fill to be a solid fill referencing the accent 1 color defined in the theme. *end example]*

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

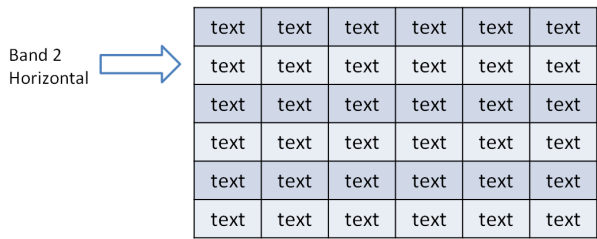

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1.
end note]

20.1.4.2.3 **band2H (Band 2 Horizontal)**

This element describes the formatting for the second row in horizontal banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[*Example:* Consider the following example of band 2 horizontal being used within DrawingML:

```
<band2H>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2H>
```

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1.
end note]

20.1.4.2.4 band2V (Band 2 Vertical)

This element describes the formatting for the second row in vertical banding. Two different row formatting are applied to the table alternating in order to create a banding effect on the table.

[Example: Consider the following example of band 2 vertical being used within DrawingML:

```
<band2V>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent2">
          <tint val="40000"/>
        </schemeClr>
      </solidFill>
    </fill>
  </tcStyle>
</band2V>
```

Band 2 Vertical

| | | | | | |
|------|------|------|------|------|------|
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |

In this example, we set the fill to be a solid fill referencing the accent 2 color defined in the theme. *end example]*

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

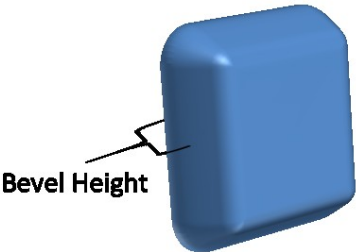

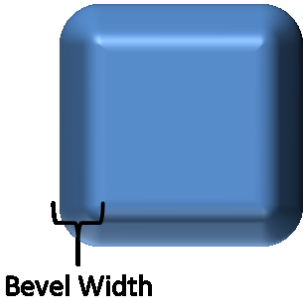

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1.
end note]

20.1.4.2.5 **bevel (Bevel)**

This element defines the properties of the bevel associated with the 3D effect applied to a cell in a table.

| Parent Elements |
|--------------------|
| cell3D (§21.1.3.1) |

| Attributes | Description |
|---------------------|--|
| h (Height) | <p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[<i>Example</i>: Consider the following example bevel</p> <div data-bbox="431 785 784 1035" data-label="Image"></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| prst (Preset Bevel) | <p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).</p> |
| w (Width) | <p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[<i>Example</i>: Consider the following example bevel</p> <div data-bbox="431 1541 732 1837" data-label="Image"></div> <p><i>end example</i>]</p> |

| Attributes | Description |
|------------|---|
| | <p>In this example, we see the width of an example bevel on a shape. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

20.1.4.2.6 **bottom (Bottom Border)**

This element defines the line properties associated with the bottom border in a table cell.

[Example: Consider the following example of the bottom border in use within DrawingML:

```
<bottom>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</bottom>
```

In this example, we see the bottom border on a table cell to be a single 1pt line which is colored accent 1. *end example*

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.7 **effect (Effect)**

This element defines the effect that can be applied to a table as a whole through a table style.

[Example: Consider the following example of an effect in use within DrawingML:

```
<effect>
  <effectLst>
    <glow rad="228600">
      <schemeClr val="accent1">
        <satMod val="175000"/>
        <alpha val="40000"/>
      </schemeClr>
    </glow>
  </effectLst>
</effect>
```

In this example, we see a glow being defined within the table style that is applied to the table as a whole. *end example]*

| Parent Elements |
|----------------------|
| tblBg (§20.1.4.2.25) |

| Child Elements | Subclause |
|------------------------------|------------|
| effectDag (Effect Container) | §20.1.8.25 |
| effectLst (Effect Container) | §20.1.8.26 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_EffectProperties](#)) is located in §A.4.1. *end note*]

20.1.4.2.8 effectRef (Effect Reference)

This element defines a reference to an effect style within the style matrix. The `idx` attribute refers the index of an effect style within the `effectStyleLst` element.

| Parent Elements |
|--|
| style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tblBg (§20.1.4.2.25) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|--------------------------|---|
| idx (Style Matrix Index) | <p>Specifies the style matrix index of the style referred to.</p> <p>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.9 fill (Fill)

This element defines the fill that is applied to the table as a whole. The background of the table can contain a single fill that is the entire size of the table. This can allow for gradient fills, or image fills, which span the entire size of the table.

[Example: Consider the following example of a fill on a table background in DrawingML:

```
<fill>
  <gradFill flip="none" rotWithShape="1">
    <gsLst>
      <gs pos="0">
        <schemeClr val="accent2">
          <shade val="75000"/>
        </schemeClr>
      </gs>
      <gs pos="100000">
        <schemeClr val="accent2">
          <shade val="75000"/>
          <tint val="20000"/>
        </schemeClr>
      </gs>
    </gsLst>
    <lin ang="2700000" scaled="1"/>
    <tileRect/>
  </gradFill>
</fill>
```

In this example, we apply a gradient fill to the entire table on the background shape of the table. *end example*]

| Parent Elements |
|--|
| tblBg (§20.1.4.2.25); tcStyle (§20.1.4.2.29) |

| Child Elements | Subclause |
|--------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FillProperties](#)) is located in §A.4.1.
end note]

20.1.4.2.10 fillRef (Fill Reference)

This element defines a reference to a fill style within the style matrix. The `idx` attribute refers to the index of a fill style or background fill style within the presentation's style matrix, defined by the `fmtScheme` element. A value of 0 or 1000 indicates no background, values 1-999 refer to the index of a fill style within the `fillStyleLst` element, and values 1001 and above refer to the index of a background fill style within the `bgFillStyleLst` element. The value 1001 corresponds to the first background fill style, 1002 to the second background fill style, and so on.

[*Example:*

```
<a:fillRef idx="2">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's second fill style using the `accent2` color of the color scheme.

end example]

[*Example:*

```
<a:fillRef idx="1001">
  <a:schemeClr val="accent2"/>
</a:fillRef>
```

The above code indicates the object is to have the style's first background fill style using the `accent2` color of the color scheme.

end example]

| Parent Elements |
|---|
| style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tblBg |

| Parent Elements |
|--|
| (§20.1.4.2.25); tcStyle (§20.1.4.2.29) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|--------------------------|---|
| idx (Style Matrix Index) | <p>Specifies the style matrix index of the style referred to.</p> <p>The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.11 firstCol (First Column)

This element defines the cell formatting which can be applied to the first column of the table.

[Example: Consider the following example of first column formatting within DrawingML:

```
<firstCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

```
<tcStyle>
  <tcBdr/>
  <fill>
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </fill>
</tcStyle>
</firstCol>
```

First Column

| | | | | | |
|-------------|------|------|------|------|------|
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |

In this example, we define the first column cell fills to be accent 1 along with the text properties to be bold when first column formatting is enabled through the user interface. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

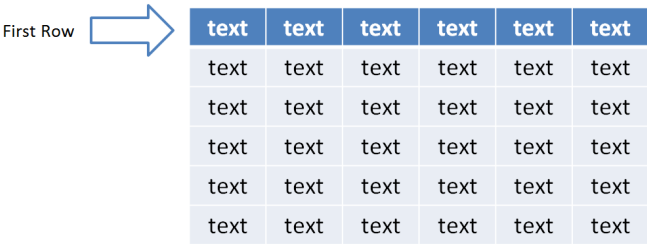

[Note: The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.12 firstRow (First Row)

This element defines the cell formatting which can be applied to the first row of the table.

[Example: Consider the following example of first row formatting within DrawingML:

```
<firstRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</firstRow>
```

In this example, we define the first row cell fills to be accent 1 along with the text properties to be bold when first row formatting is enabled through the user interface. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[Note: The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.13 font (Font)

This element defines the font to be used within a given table cell text style. This element allows for exact definition of the font within the table style instead of referencing a themed font.

| Parent Elements |
|--------------------------|
| tcTxStyle (§20.1.4.2.30) |

| Child Elements | Subclause |
|--------------------------|--------------|
| cs (Complex Script Font) | §21.1.2.3.1 |
| ea (East Asian Font) | §21.1.2.3.3 |
| extLst (Extension List) | §20.1.2.2.15 |
| font (Font) | §20.1.4.1.16 |
| latin (Latin Font) | §21.1.2.3.7 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FontCollection](#)) is located in §A.4.1. *end note*]

20.1.4.2.14 insideH (Inside Horizontal Border)

This element defines the line properties associated with the inner horizontal borders in a table.

[*Example:* Consider the following example of the inner horizontal borders in use within DrawingML:

```
<insideH>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideH>
```

In this example, we see the inner horizontal borders in a table to be a single 1pt line which is colored accent 1. *end example*]

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.15 `insideV` (Inside Vertical Border)

This element defines the line properties associated with the inner vertical borders in a table.

[*Example:* Consider the following example of the inside vertical borders in use within DrawingML:

```
<insideV>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</insideV>
```

In this example, we see the inner vertical borders in a table to be a single 1pt line which is colored accent 1. *end example*

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.16 `lastCol` (Last Column)

This element defines the cell formatting which can be applied to the last column of the table.

[*Example:* Consider the following example of last column formatting within DrawingML:

```
<lastCol>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
```

```
<tcStyle>
  <tcBdr/>
  <fill>
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </fill>
</tcStyle>
</lastCol>
```

Last Column

| | | | | | |
|------|------|------|------|------|-------------|
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |
| text | text | text | text | text | text |

In this example, we define the last column cell fills to be accent 1 along with the text properties to be bold when last column formatting is enabled through the user interface. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.17 lastRow (Last Row)

This element defines the cell formatting which can be applied to the last row of the table.

[*Example:* Consider the following example of last row formatting within DrawingML:

```
<lastRow>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</lastRow>
```

In this example, we define the last row cell fills to be accent 1 along with the text properties to be bold when last row formatting is enabled through the user interface. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[Note: The W3C XML Schema definition of this element’s content model (CT_TablePartStyle) is located in §A.4.1. *end note*]

20.1.4.2.18 left (Left Border)

This element defines the line properties associated with the left border in a table cell.

[Example: Consider the following example of the left border in use within DrawingML:

```
<left>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</left>
```

In this example, we see the left border on a table cell to be a single 1pt line which is colored accent 1. *end example]*

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element’s content model ([CT ThemeableLineStyle](#)) is located in §A.4.1. *end note]*

20.1.4.2.19 lnRef (Line Reference)

This element defines a reference to a line style within the style matrix. The idx attribute refers the index of a line style within the fillStyleLst element.

| Parent Elements |
|---|
| bottom (§20.1.4.2.6); insideH (§20.1.4.2.14); insideV (§20.1.4.2.15); left (§20.1.4.2.18); right (§20.1.4.2.22); style (§21.3.2.24); style (§21.4.2.28); style (§20.1.2.2.37); style (§20.5.2.31); style (§19.3.1.46); tl2br (§20.1.4.2.31); top (§20.1.4.2.32); tr2bl (§20.1.4.2.33) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|--------------------------|--|
| idx (Style Matrix Index) | Specifies the style matrix index of the style referred to. The possible values for this attribute are defined by the ST_StyleMatrixColumnIndex simple type (§20.1.10.56). |

[Note: The W3C XML Schema definition of this element's content model ([CT_StyleMatrixReference](#)) is located in §A.4.1. *end note*]

20.1.4.2.20 neCell (Northeast Cell)

This element defines the formatting for the cell in the northeast corner of a table when both the first row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the northeast cell formatting within DrawingML:

```
<neCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</neCell>
```

In this example, we specifically set the northeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.21 nwCell (Northwest Cell)

This element defines the formatting for the cell in the northwest corner of a table when both the first row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example*: Consider the following example of the northwest cell formatting within DrawingML:

```
<nwCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</nwCell>
```

In this example, we specifically set the northwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[Note: The W3C XML Schema definition of this element's content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.22 **right (Right Border)**

This element defines the line properties associated with the right border in a table cell.

[Example: Consider the following example of the right border in use within DrawingML:

```
<right>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</right>
```

In this example, we see the right border on a table cell to be a single 1pt line which is colored accent 1. *end example*

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.23 **seCell (Southeast Cell)**

This element defines the formatting for the cell in the southeast corner of a table when both the last row formatting and last column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[Example: Consider the following example of the southeast cell formatting within DrawingML:

```
<seCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</seCell>
```

In this example, we specifically set the southeast cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.24 swCell (Southwest Cell)

This element defines the formatting for the cell in the southwest corner of a table when both the last row formatting and first column formatting are enabled. This formatting is only applied to the single cell which overlaps between the two formatting options.

[*Example:* Consider the following example of the southwest cell formatting within DrawingML:

```
<swCell>
  <tcTxStyle b="on">
    <fontRef idx="minor">
      <scrgbClr r="0" g="0" b="0"/>
    </fontRef>
    <schemeClr val="lt1"/>
  </tcTxStyle>
  <tcStyle>
    <tcBdr/>
    <fill>
      <solidFill>
        <schemeClr val="accent1"/>
      </solidFill>
    </fill>
  </tcStyle>
</swCell>
```

In this example, we specifically set the southwest cell to contain bold text with a solid cell fill in the color of accent 1. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.25 **tblBg (Table Background)**

This element defines the formatting options which can be applied to the table background shape. The background shape is the same size as the entire table and can hold a fill or an effect which spans the entire table.

[*Example:* Consider the following example of a table background in use within DrawingML:

```
<tblBg>
  <fillRef idx="2">
    <schemeClr val="accent1"/>
  </fillRef>
  <effectRef idx="1">
    <schemeClr val="accent1"/>
  </effectRef>
</tblBg>
```

In this example, we see that there is a themed fill and themed effect being applied to the table background through the table style. *end example*

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|------------------------------|--------------|
| effect (Effect) | §20.1.4.2.7 |
| effectRef (Effect Reference) | §20.1.4.2.8 |
| fill (Fill) | §20.1.4.2.9 |
| fillRef (Fill Reference) | §20.1.4.2.10 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TableBackgroundStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.26 [tblStyle \(Table Style\)](#)

This is the root element for a table style. Within the table style are different formatting options available in order to apply a table.

| Parent Elements |
|----------------------------|
| tblStyleLst (§20.1.4.2.27) |

| Child Elements | Subclause |
|----------------------------|--------------|
| band1H (Band 1 Horizontal) | §20.1.4.2.1 |
| band1V (Band 1 Vertical) | §20.1.4.2.2 |
| band2H (Band 2 Horizontal) | §20.1.4.2.3 |
| band2V (Band 2 Vertical) | §20.1.4.2.4 |
| extLst (Extension List) | §20.1.2.2.15 |
| firstCol (First Column) | §20.1.4.2.11 |

| Child Elements | Subclause |
|--------------------------|--------------|
| firstRow (First Row) | §20.1.4.2.12 |
| lastCol (Last Column) | §20.1.4.2.16 |
| lastRow (Last Row) | §20.1.4.2.17 |
| neCell (Northeast Cell) | §20.1.4.2.20 |
| nwCell (Northwest Cell) | §20.1.4.2.21 |
| seCell (Southeast Cell) | §20.1.4.2.23 |
| swCell (Southwest Cell) | §20.1.4.2.24 |
| tblBg (Table Background) | §20.1.4.2.25 |
| wholeTbl (Whole Table) | §20.1.4.2.34 |

| Attributes | Description |
|--------------------|---|
| styleId (Style ID) | Specifies a GUID identifying the table style in a unique manner. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4). |
| styleName (Name) | Specifies the name of the table style which can show up in the user interface identifying the style to a user. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.27 tblStyleLst (Table Style List)

This element is simply a list of table styles which are used within a document.

[Example: Consider the following example of a table style list within DrawingML:

```
<tblStyleLst def="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}">
  <tblStyle styleId="{5C22544A-7EE6-4342-B048-85BDC9FD1C3A}"
    styleName="Medium Style 2 - Accent 1">
    ...
  </tblStyle>
  <tblStyle styleId="{3C2FFA5D-87B4-456A-9821-1D502468CF0F}"
    styleName="Themed Style 1 - Accent 1">
    ...
  </tblStyle>
</tblStyleLst>
```

In this example, we see two table styles defined along with the default being specified. *end example*]

| Parent Elements |
|---|
| Root element of DrawingML Table Styles part |

| Child Elements | Subclause |
|------------------------|--------------|
| tblStyle (Table Style) | §20.1.4.2.26 |

| Attributes | Description |
|---------------|---|
| def (Default) | The GUID corresponding to the default table style in the list of table styles. This default can be used when a table is initially inserted into a document. The possible values for this attribute are defined by the ST_Guid simple type (§22.9.2.4). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TableStyleList](#)) is located in §A.4.1. *end note*]

20.1.4.2.28 tcBdr (Table Cell Borders)

This element defines the borders for the cells within a table.

[Example: Consider the following example of table cell borders being used within DrawingML:

```
<tcBdr>
  <left>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </left>
  <right>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </right>
  <top>
    <lnRef idx="1">
      <schemeClr val="accent1"/>
    </lnRef>
  </top>
```

```
<bottom>
  <lnRef idx="2">
    <schemeClr val="lt1"/>
  </lnRef>
</bottom>
<insideH>
  <ln>
    <noFill/>
  </ln>
</insideH>
<insideV>
  <ln>
    <noFill/>
  </ln>
</insideV>
</tcBdr>
```

In this example, we define borders for the bottom, top, right, and left borders of the table cells. *end example*]

| Parent Elements |
|------------------------|
| tcStyle (§20.1.4.2.29) |

| Child Elements | Subclause |
|---|--------------|
| bottom (Bottom Border) | §20.1.4.2.6 |
| extLst (Extension List) | §20.1.2.2.15 |
| insideH (Inside Horizontal Border) | §20.1.4.2.14 |
| insideV (Inside Vertical Border) | §20.1.4.2.15 |
| left (Left Border) | §20.1.4.2.18 |
| right (Right Border) | §20.1.4.2.22 |
| tl2br (Top Left to Bottom Right Border) | §20.1.4.2.31 |
| top (Top Border) | §20.1.4.2.32 |
| tr2bl (Top Right to Bottom Left Border) | §20.1.4.2.33 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_TableCellStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.29 tcStyle (Table Cell Style)

This element defines the style for a give cell in a table.

[*Example:* Consider the following example of a table cell style in use within DrawingML:

```
<tcStyle>
  <tcBdr>
    ...
  </tcBdr>
  <fill>
    ...
  </fill>
</tcStyle>
```

In this example, we see that a set of borders for the cell along with a cell fill are being defined. *end example*]

| Parent Elements |
|---|
| band1H (§20.1.4.2.1); band1V (§20.1.4.2.2); band2H (§20.1.4.2.3); band2V (§20.1.4.2.4); firstCol (§20.1.4.2.11); firstRow (§20.1.4.2.12); lastCol (§20.1.4.2.16); lastRow (§20.1.4.2.17); neCell (§20.1.4.2.20); nwCell (§20.1.4.2.21); seCell (§20.1.4.2.23); swCell (§20.1.4.2.24); wholeTbl (§20.1.4.2.34) |

| Child Elements | Subclause |
|----------------------------|--------------|
| cell3D (Cell 3-D) | §21.1.3.1 |
| fill (Fill) | §20.1.4.2.9 |
| fillRef (Fill Reference) | §20.1.4.2.10 |
| tcBdr (Table Cell Borders) | §20.1.4.2.28 |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT TableStyleCellStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.30 **tcTxStyle** (Table Cell Text Style)

This element defines the text properties associated with the text contained within a table cell.

[*Example*: Consider the following example of a table cell text style in use within DrawingML:

```
<tcTxStyle b="on">
  <fontRef idx="minor">
    <scrgbClr r="0" g="0" b="0"/>
  </fontRef>
  <schemeClr val="lt1"/>
</tcTxStyle>
```

In this example, we define the text within the cell to be bold and reference the themed minor font and to also be the light 1 color. *end example*]

| Parent Elements |
|---|
| band1H (§20.1.4.2.1); band1V (§20.1.4.2.2); band2H (§20.1.4.2.3); band2V (§20.1.4.2.4); firstCol (§20.1.4.2.11); firstRow (§20.1.4.2.12); lastCol (§20.1.4.2.16); lastRow (§20.1.4.2.17); neCell (§20.1.4.2.20); nwCell (§20.1.4.2.21); seCell (§20.1.4.2.23); swCell (§20.1.4.2.24); wholeTbl (§20.1.4.2.34) |

| Child Elements | Subclause |
|---|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| font (Font) | §20.1.4.2.13 |
| fontRef (Font Reference) | §20.1.4.1.17 |
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|------------|--|
| b (Bold) | Specifies if the text is to be bolded. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§20.1.10.36). |
| i (Italic) | Specifies if the text is to be italicized. The possible values for this attribute are defined by the ST_OnOffStyleType simple type (§20.1.10.36). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TableStyleTextStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.31 **tl2br** (Top Left to Bottom Right Border)

This element defines the line properties associated with the border which goes from the top-left to the bottom-right corner in a table cell.

[Example: Consider the following example of the top border in use within DrawingML:

```
<t12br>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</t12br>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.32 top (Top Border)

This element defines the line properties associated with the top border in a table cell.

[*Example:* Consider the following example of the top border in use within DrawingML:

```
<top>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</top>
```

In this example, we see the top border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.33 tr2bl (Top Right to Bottom Left Border)

This element defines the line properties associated with the border which goes from the top-right to the bottom-left corner in a table cell.

[Example: Consider the following example of the top border in use within DrawingML:

```
<tr2bl>
  <ln w="12700" cmpd="sng">
    <solidFill>
      <schemeClr val="accent1"/>
    </solidFill>
  </ln>
</tr2bl>
```

In this example, we see the border on a table cell to be a single 1pt line which is colored accent 1. *end example*]

| Parent Elements |
|----------------------|
| tcBdr (§20.1.4.2.28) |

| Child Elements | Subclause |
|------------------------|--------------|
| ln (Outline) | §20.1.2.2.24 |
| lnRef (Line Reference) | §20.1.4.2.19 |

[Note: The W3C XML Schema definition of this element's content model ([CT_ThemeableLineStyle](#)) is located in §A.4.1. *end note*]

20.1.4.2.34 wholeTbl (Whole Table)

This element contains formatting options which are applied to the table as a whole when it is in its default state with no formatting options (first row, last row, etc) enabled.

[Example: Consider the following example of whole table being used within DrawingML:

```
<wholeTbl>
  <tcTxStyle>
    ...
  </tcTxStyle>
  <tcStyle>
    ...
  </tcStyle>
</wholeTbl>
```

In this example, we see definitions for the text and the cells within the table. *end example*]

| Parent Elements |
|--|
| tableStyle (§21.1.3.11); tblStyle (§20.1.4.2.26) |

| Child Elements | Subclause |
|-----------------------------------|--------------|
| tcStyle (Table Cell Style) | §20.1.4.2.29 |
| tcTxStyle (Table Cell Text Style) | §20.1.4.2.30 |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TablePartStyle](#)) is located in §A.4.1. *end note*]

20.1.5 3D

The 3D portion of the DrawingML framework allows for the describing of a 3D scene to be placed within a document. This 3D scene can be described using text and shape objects along with various lighting, material and camera settings.

20.1.5.1 anchor (Anchor Point)

This element specifies a point in 3D space. This point is the point in space that anchors the backdrop plane. Please see the example in the backdrop (§20.1.5.2) definition for an in depth explanation of this element.

| Parent Elements |
|----------------------|
| backdrop (§20.1.5.2) |

| Attributes | Description |
|------------------------|---|
| x (X-Coordinate in 3D) | X-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| y (Y-Coordinate in | Y-Coordinate in 3D space. |

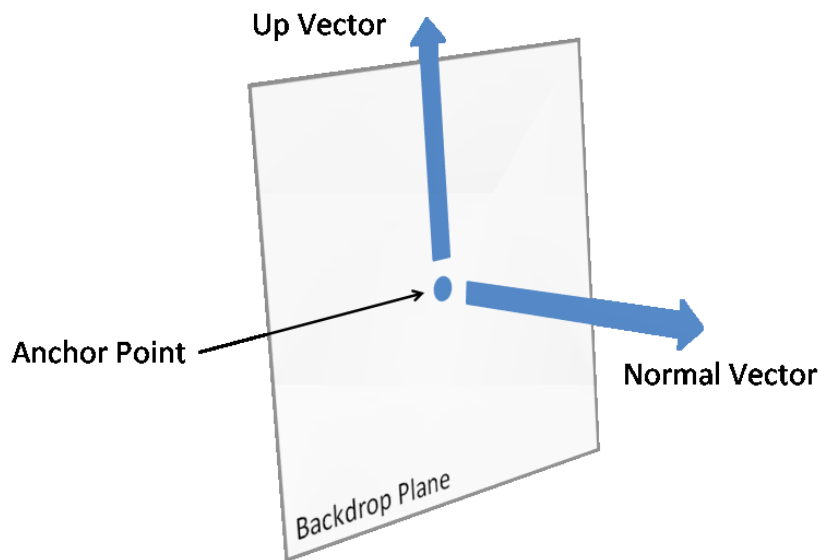

| Attributes | Description |
|------------------------|---|
| 3D) | The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| z (Z-Coordinate in 3D) | Z-Coordinate in 3D space. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Point3D](#)) is located in §A.4.1. *end note*]

20.1.5.2 backdrop (Backdrop Plane)

This element defines a plane in which effects, such as glow and shadow, are applied in relation to the shape they are being applied to. The points and vectors contained within the backdrop define a plane in 3D space.

[Example: Consider the following image as an explanation of the backdrop plane definition:

In this image we see a plane being defined by an anchor point, the vector normal to the face of the plane and a vector pointing up in relation to the plane. *end example*]

| Parent Elements |
|---|
| scene3d (§21.4.5.5); scene3d (§20.1.4.1.26) |

| Child Elements | Subclause |
|-----------------------|-----------|
| anchor (Anchor Point) | §20.1.5.1 |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| norm (Normal) | §20.1.5.10 |
| up (Up Vector) | §20.1.5.13 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Backdrop](#)) is located in §A.4.1. *end note*]

20.1.5.3 **bevelB (Bottom Bevel)**

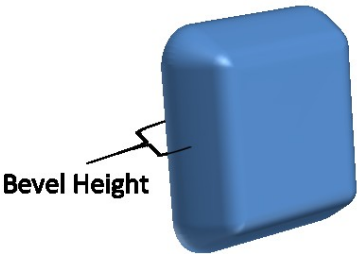

This element holds the properties associated with defining a bevel on the bottom or back face of a shape.

[*Example:* Consider the following example of an sp3d containing a bottom bevel.

```
<a:sp3d>
  <a:bevelB w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a bottom bevel being defined with a preset bevel type along with a custom width and height. *end example*]

| Parent Elements |
|-------------------------------------|
| sp3d (§21.4.5.6); sp3d (§20.1.5.12) |

| Attributes | Description |
|---------------------|--|
| h (Height) | <p>Specifies the height of the bevel, or how far above the shape it is applied.</p> <p>[<i>Example:</i> Consider the following example bevel</p> <div data-bbox="430 1367 784 1619" data-label="Image"></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| prst (Preset Bevel) | <p>Specifies the preset bevel type which defines the look of the bevel.</p> |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9). |
| w (Width) | <p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel]</p>  <p>Bevel Width</p> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i></p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

20.1.5.4 bevelT (Top Bevel)

This element holds the properties associated with defining a bevel on the top or front face of a shape.

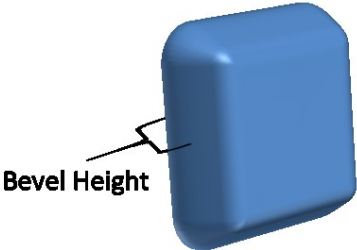

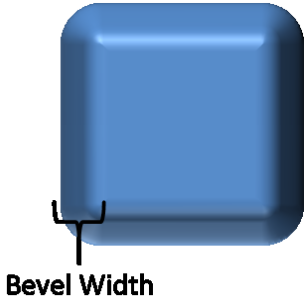

[Example: Consider the following example of an sp3d containing a top bevel.

```
<a:sp3d>
  <a:bevelT w="139700" h="127000" prst="coolSlant"/>
</a:sp3d>
```

In this example, we see a top bevel being defined with a preset bevel type along with a custom width and height. *end example*

| Parent Elements |
|-------------------------------------|
| sp3d (§21.4.5.6); sp3d (§20.1.5.12) |

| Attributes | Description |
|------------|--|
| h (Height) | Specifies the height of the bevel, or how far above the shape it is applied. |

| Attributes | Description |
|---------------------|---|
| | <p>[Example: Consider the following example bevel</p> <div data-bbox="430 321 784 569"><p>Bevel Height</p></div> <p>In this example, we see the height of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| prst (Preset Bevel) | <p>Specifies the preset bevel type which defines the look of the bevel.</p> <p>The possible values for this attribute are defined by the ST_BevelPresetType simple type (§20.1.10.9).</p> |
| w (Width) | <p>Specifies the width of the bevel, or how far into the shape it is applied.</p> <p>[Example: Consider the following example bevel</p> <div data-bbox="430 1075 732 1371"><p>Bevel Width</p></div> <p>In this example, we see the width of an example bevel on a shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Bevel](#)) is located in §A.4.1. *end note*]

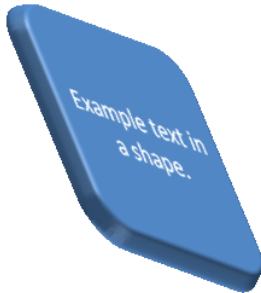

20.1.5.5 camera (Camera)

This element defines the placement and properties of the camera in the 3D scene. The camera position and properties modify the view of the scene.

[*Example*: Consider the following example of a camera in DrawingML:

```
<a:camera prst="orthographicFront">
  <a:rot lat="19902513" lon="17826689" rev="1362739"/>
</a:camera>
```

In this example, we see a preset camera being defined along with a rotation containing latitude, longitude, and revolution overrides provided that further rotate the camera around the scene. The effect of this camera can be seen on the following shape:

end example]

| Parent Elements |
|---|
| scene3d (§21.4.5.5); scene3d (§20.1.4.1.26) |

| Child Elements | Subclause |
|----------------|------------|
| rot (Rotation) | §20.1.5.11 |

| Attributes | Description |
|---------------------|---|
| fov (Field of View) | <p>Provides an override for the default field of view for the camera. Different perspectives can be obtained by modifying this attribute.</p> <p>[<i>Example</i>: Consider the following example of a fov in DrawingML:</p> <pre><a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera></pre> <p>In this example, we see a fov being defined which modifies the default fov for the preset camera. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_FOVAngle simple type (§20.1.10.26).</p> |

| Attributes | Description |
|---------------------------|---|
| prst (Preset Camera Type) | <p>Defines the preset camera that is being used by the camera element. The preset camera defines a starting point for common preset rotations in space.</p> <p>[<i>Example:</i> Consider the following example of a prst in DrawingML:</p> <pre><a:camera prst="perspectiveContrastingRightFacing" fov="6900000"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> </a:camera></pre> <p>In this example, we see a prst being defined as perspectiveContrastingRightFacing. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PresetCameraType simple type (§20.1.10.46).</p> |
| zoom (Zoom) | <p>Defines the zoom factor of a given camera element. The zoom modifies the scene as a whole and zooms in or out accordingly.</p> <p>[<i>Example:</i> Consider the following example of a zoom in DrawingML:</p> <pre><a:camera prst="perspectiveContrastingRightFacing" fov="6900000" zoom="200%"> <a:rot lat="1200000" lon="18000000" rev="1200000"/> /a:camera></pre> <p>In this example, we see a zoom being used which zooms the scene by 200%. <i>end example]</i></p> <p>The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Camera](#)) is located in §A.4.1. *end note]*

20.1.5.6 [contourClr \(Contour Color\)](#)

This element defines the color for the contour on a shape. The contour of a shape is a solid filled line which surrounds the outer edges of the shape.

[*Example:* Consider the following example of a contour defined on a shape which includes a contourClr. Lighting characteristics applied to the shape are ignored when it comes to the contour on the shape.

```
<a:sp3d contourW="101600" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
```

```
<a:contourClr>
  <a:schemeClr val="bg1"/>
</a:contourClr>
</a:sp3d>
```

In this example, we see a contour defined on a shape with a top and bottom bevel defined. In the image below, the contour is the white ring around the shape.

end example]

| Parent Elements |
|-------------------------------------|
| sp3d (§21.4.5.6); sp3d (§20.1.5.12) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[Note: The W3C XML Schema definition of this element’s content model (CT_Color) is located in §A.4.1. *end note*]

20.1.5.7 **extrusionClr (Extrusion Color)**

This element defines the color of the extrusion applied to a shape. The extrusion on a shape is an artificial height applied to the geometry.

[*Example:* Consider the following example of an extrusion which takes advantage of the extrusionClr. Lighting characteristics that are applied to the shape are also applied to the extrusion on the shape.

```
<a:sp3d extrusionH="139700" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
  <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
</a:sp3d>
```

In this example, we see the extrusion color defined as red which can also be shown applied to the shape in the following image:

end example]

| Parent Elements |
|-------------------------------------|
| sp3d (§21.4.5.6); sp3d (§20.1.5.12) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.5.8 flatTx (No text in 3D scene)

Keep text out of 3D scene entirely.

| Parent Elements |
|---|
| bodyPr (§21.1.2.1.1); txPr (§21.4.5.12) |

| Attributes | Description |
|------------------|---|
| z (Z Coordinate) | Specifies the Z coordinate to be used in positioning the flat text within the 3D scene. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_FlatText](#)) is located in §A.4.1. *end note*]

20.1.5.9 lightRig (Light Rig)

This element defines the light rig associated with the table. The light rig comes into play when there is a 3D bevel applied to a cell. When 3D is used, the light rig defines the lighting properties associated with the scene.

| Parent Elements |
|---|
| cell3D (§21.1.3.1); scene3d (§21.4.5.5); scene3d (§20.1.4.1.26) |

| Child Elements | Subclause |
|----------------|------------|
| rot (Rotation) | §20.1.5.11 |

| Attributes | Description |
|-----------------|--|
| dir (Direction) | Defines the direction from which the light rig is oriented in relation to the scene. [<i>Example:</i> Consider the following example of dir being used in a light rig: <pre><a:lightRig rig="threePt" dir="t"/></pre> In this example, we define the direction to be top. <i>end example</i>] The possible values for this attribute are defined by the ST_LightRigDirection simple type (§20.1.10.29). |

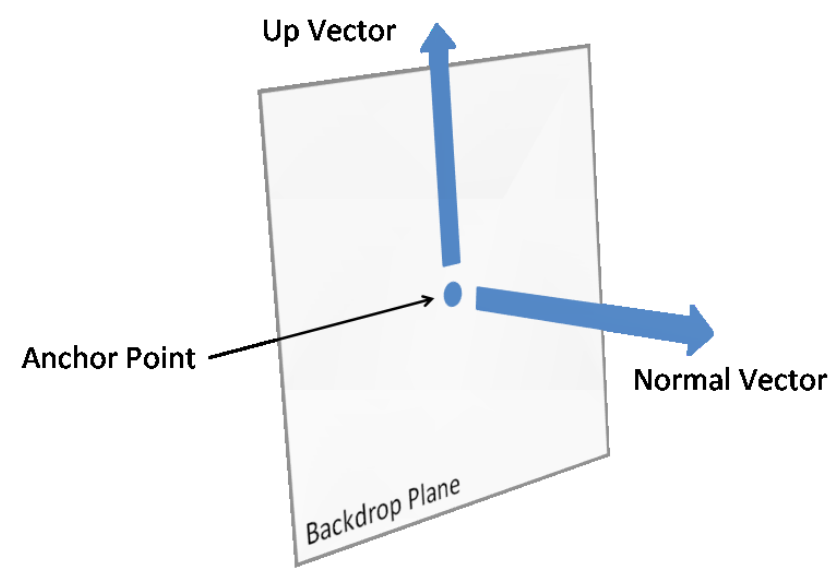

| Attributes | Description |
|------------------|---|
| rig (Rig Preset) | <p>Defines the preset type of light rig which is to be applied to the scene.</p> <p>[<i>Example:</i> Consider the following example of rig being used in a light rig:</p> <pre><a:lightRig rig="threePt" dir="t"/></pre> <p>In this example, we define the rig to be a threePt rig. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_LightRigType simple type (§20.1.10.30).</p> |

[*Note:* The W3C XML Schema definition of this element’s content model (CT_LightRig) is located in §A.4.1. *end note*]

20.1.5.10 norm (Normal)

This element defines a normal vector. To be more precise, this attribute defines a vector normal to the face of the backdrop plane.

[*Example:* Consider the following image as an example of what a normal vector is in relation to the backdrop plane:

end example]

| Parent Elements |
|----------------------|
| backdrop (§20.1.5.2) |

| Attributes | Description |
|----------------------------------|---|
| dx (Distance along X-axis in 3D) | Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| dy (Distance along Y-axis in 3D) | Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| dz (Distance along Z-axis in 3D) | Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Vector3D](#)) is located in §A.4.1. *end note*]

20.1.5.11 rot (Rotation)

This element defines a rotation in 3D space. A rotation in DrawingML is defined through the use of a latitude coordinate, a longitude coordinate, and a revolution about the axis as the latitude and longitude coordinates.

[Example: Consider the following example of a rotation defined by the rot elements being used in a lightRig in DrawingML:

```
<a:lightRig rig="twoPt" dir="t">
  <a:rot lat="0" lon="0" rev="6000000"/>
</a:lightRig>
```

In this example, we have only a revolution applied to the light rig which rotates it around it's center axis. *end example*]

| Parent Elements |
|--|
| camera (§20.1.5.5); lightRig (§20.1.5.9) |

| Attributes | Description |
|----------------|---|
| lat (Latitude) | Defines the latitude value of the rotation. [Example: Consider the following example of a rot in DrawingML: <pre><a:rot lat="0" lon="0" rev="6000000"/></pre> In this example, we set the lat to be equal to 0. <i>end example</i>] |

| Attributes | Description |
|------------------|---|
| | The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| lon (Longitude) | <p>Defines the longitude value of the rotation.</p> <p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre><a:rot lat="0" lon="0" rev="6000000"/></pre> <p>In this example, we set the lon to be equal to 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p> |
| rev (Revolution) | <p>This attributes defines the revolution around the central axis in the rotation.</p> <p>[<i>Example:</i> Consider the following example of a rot in DrawingML:</p> <pre><a:rot lat="0" lon="0" rev="6000000"/></pre> <p>In this example, we set the rev to be equal to 6000000. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_SphereCoords](#)) is located in §A.4.1. *end note*]

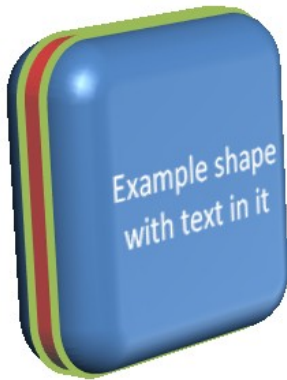

20.1.5.12 sp3d (Apply 3D shape properties)

This element defines the 3D properties associated with a particular shape in DrawingML. The 3D properties which can be applied to a shape are top and bottom bevels, a contour and an extrusion.

[*Example:* Consider the following example of an sp3d in DrawingML:

```
<a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic">
  <a:bevelT w="254000" h="254000"/>
  <a:bevelB w="254000" h="254000"/>
  <a:extrusionClr>
    <a:srgbClr val="FF0000"/>
  </a:extrusionClr>
  <a:contourClr>
    <a:schemeClr val="accent3"/>
  </a:contourClr>
</a:sp3d>
```

In this example, we see an sp3d defined which contains information defining both a top and bottom bevel, along with an extrusion and contour on the shape. The following image illustrates a shape with the applied sp3d:

end example]

| Parent Elements |
|---|
| bodyPr (§21.1.2.1.1); effectStyle (§20.1.4.1.11); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); txPr (§21.4.5.12) |

| Child Elements | Subclause |
|--------------------------------|--------------|
| bevelB (Bottom Bevel) | §20.1.5.3 |
| bevelT (Top Bevel) | §20.1.5.4 |
| contourClr (Contour Color) | §20.1.5.6 |
| extLst (Extension List) | §20.1.2.2.15 |
| extrusionClr (Extrusion Color) | §20.1.5.7 |

| Attributes | Description |
|--------------------------|--|
| contourW (Contour Width) | <p>Defines the width of the contour on the shape.</p> <p>[Example: Consider the following example of a contourW in use within the sp3d element:</p> <pre><a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr></pre> |

| Attributes | Description |
|--|--|
| | <pre> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> </pre> <p>In this example, we see a countourW defined as 50800. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| extrusionH (Extrusion Height) | <p>Defines the height of the extrusion applied to the shape.</p> <p>[<i>Example:</i> Consider the following example of an extrusionH in use within the sp3d element:</p> <pre> <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </a:sp3d> </pre> <p>In this example, we see a extrusionH defined as 165100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| prstMaterial (Preset Material Type) | <p>Defines the preset material which is combined with the lighting properties to give the final look and feel of a shape.</p> <p>[<i>Example:</i> Consider the following example of a prstMaterial in use within the sp3d element:</p> <pre> <a:sp3d extrusionH="165100" contourW="50800" prstMaterial="plastic"> <a:bevelT w="254000" h="254000"/> <a:bevelB w="254000" h="254000"/> <a:extrusionClr> <a:srgbClr val="FF0000"/> </a:extrusionClr> <a:contourClr> <a:schemeClr val="accent3"/> </a:contourClr> </pre> |

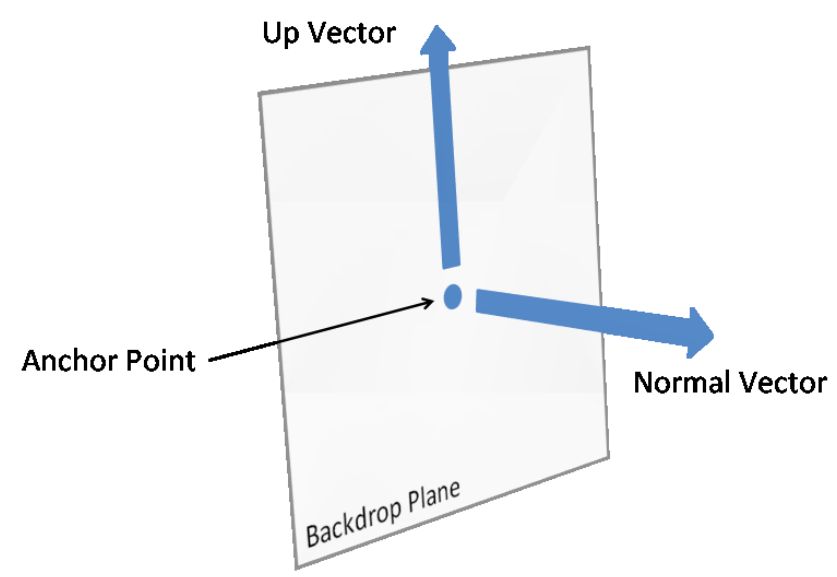

| Attributes | Description |
|-----------------|---|
| | <div></a:sp3d></div> <div>In this example, we see a prstMaterial defined as plastic. <i>end example</i></div> <div>The possible values for this attribute are defined by the ST_PresetMaterialType simple type (§20.1.10.49).</div> |
| z (Shape Depth) | <div>Defines the z coordinate for the 3D shape.</div> <div>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</div> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_Shape3D](#)) is located in §A.4.1. *end note*]

20.1.5.13 up (Up Vector)

This element defines a vector representing up. To be more precise, this attribute defines a vector representing up in relation to the face of the backdrop plane.

[Example: Consider the following image as an example of what an up vector is in relation to the backdrop plane:

end example]

| Parent Elements |
|----------------------|
| backdrop (§20.1.5.2) |

| Attributes | Description |
|----------------------------------|---|
| dx (Distance along X-axis in 3D) | Distance along X-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| dy (Distance along Y-axis in 3D) | Distance along Y-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| dz (Distance along Z-axis in 3D) | Distance along Z-axis in 3D The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Vector3D](#)) is located in §A.4.1. *end note*]

20.1.6 Shared Style Sheet

The shared style sheet aspects contained within DrawingML are responsible for containing formatting options and styles which can be used by applications to define a certain look or feel to documents. The shared style sheet can be used by any document category ([*Note*: For example, a presentation. *end note*]) to pull visual information from which formats the document in a certain way, or theme. The shared style sheet contains information that is not document-category specific.

20.1.6.1 clrMap (Color Map)

This element specifies the color mapping layer which allows a user to define colors for background and text. This allows for swapping out of light/dark colors for backgrounds and the text on top of the background in order to maintain readability of the text. On a deeper level, this specifies exactly which colors the first 12 values refer to in the color scheme.

[*Example*: Consider the following example of a color map in use:

```
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

In this example, we see that bg1 is mapped to lt1, tx1 is mapped to dk1, and so on. *end example*]

| Parent Elements |
|----------------------------|
| extraClrScheme (§20.1.6.4) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|-------------------------------|--|
| accent1 (Accent 1) | Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent2 (Accent 2) | Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent3 (Accent 3) | Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent4 (Accent 4) | Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent5 (Accent 5) | Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent6 (Accent 6) | Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg1 (Background 1) | A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg2 (Background 2) | Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| folHlink (Followed Hyperlink) | Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| hlink (Hyperlink) | Specifies a color defined which is associated as the color for a hyperlink. |

| Attributes | Description |
|--------------|---|
| | The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx1 (Text 1) | Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx2 (Text 2) | Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. end note]

20.1.6.2 clrScheme (Color Scheme)

This element defines a set of colors which are referred to as a color scheme. The color scheme is responsible for defining a list of twelve colors. The twelve colors consist of six accent colors, two dark colors, two light colors and a color for each of a hyperlink and followed hyperlink.

The Color Scheme Color elements appear in a sequence. The following listing shows the index value and corresponding Color Name.

| Sequence Index | Element (Color) Name |
|----------------|-------------------------------|
| 0 | dk1 (Dark 1) |
| 1 | lt1 (Light 1) |
| 2 | dk2 (Dark 2) |
| 3 | lt2 (Light 2) |
| 4 | accent1 (Accent 1) |
| 5 | accent2 (Accent 2) |
| 6 | accent3 (Accent 3) |
| 7 | accent4 (Accent 4) |
| 8 | accent5 (Accent 5) |
| 9 | accent6 (Accent 6) |
| 10 | hlink (Hyperlink) |
| 11 | folHlink (Followed Hyperlink) |

[Example: Consider the following example of a color scheme defined in DrawingML:

```

<clrScheme name="sample">
  <dk1>
    <sysClr val="windowText"/>
  </dk1>
  <lt1>
    <sysClr val="window"/>
  </lt1>
  <dk2>
    <srgbClr val="04617B"/>
  </dk2>
  <lt2>
    <srgbClr val="DBF5F9"/>
  </lt2>
  <accent1>
    <srgbClr val="0F6FC6"/>
  </accent1>
  <accent2>
    <srgbClr val="009DD9"/>
  </accent2>
  <accent3>
    <srgbClr val="0BD0D9"/>
  </accent3>
  <accent4>
    <srgbClr val="10CF9B"/>
  </accent4>
  <accent5>
    <srgbClr val="7CCA62"/>
  </accent5>
  <accent6>
    <srgbClr val="A5C249"/>
  </accent6>
  <hlink>
    <srgbClr val="FF9800"/>
  </hlink>
  <folHlink>
    <srgbClr val="F45511"/>
  </folHlink>
</clrScheme>

```

In this example, are defined the 12 theme colors in the sample color scheme. *end example*]

| Parent Elements |
|--|
| extraClrScheme (§20.1.6.4); themeElements (§20.1.6.10); themeOverride (§20.1.6.12) |

| Child Elements | Subclause |
|-------------------------------|--------------|
| accent1 (Accent 1) | §20.1.4.1.1 |
| accent2 (Accent 2) | §20.1.4.1.2 |
| accent3 (Accent 3) | §20.1.4.1.3 |
| accent4 (Accent 4) | §20.1.4.1.4 |
| accent5 (Accent 5) | §20.1.4.1.5 |
| accent6 (Accent 6) | §20.1.4.1.6 |
| dk1 (Dark 1) | §20.1.4.1.9 |
| dk2 (Dark 2) | §20.1.4.1.10 |
| extLst (Extension List) | §20.1.2.2.15 |
| folHlink (Followed Hyperlink) | §20.1.4.1.15 |
| hlink (Hyperlink) | §20.1.4.1.19 |
| lt1 (Light 1) | §20.1.4.1.22 |
| lt2 (Light 2) | §20.1.4.1.23 |

| Attributes | Description |
|-------------|--|
| name (Name) | <p>The common name for this color scheme. This name can show up in the user interface in a list of color schemes.</p> <p>The possible values for this attribute are defined by the W3C XML Schema string datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ColorScheme](#)) is located in §A.4.1.
end note]

20.1.6.3 [custClrLst \(Custom Color List\)](#)

This element allows for a custom color palette to be created and which shows up alongside other color schemes. This can be very useful, for example, when someone would like to maintain a corporate color palette.

| Parent Elements |
|-------------------|
| theme (§20.1.6.9) |

| Child Elements | Subclause |
|------------------------|-------------|
| custClr (Custom color) | §20.1.4.1.8 |

[Note: The W3C XML Schema definition of this element's content model ([CT_CustomColorList](#)) is located in §A.4.1. *end note*]

20.1.6.4 `extraClrScheme` (Extra Color Scheme)

This element defines an auxiliary color scheme, which includes both a color scheme and color mapping. This is mainly used for backward compatibility concerns and roundtrips information required by earlier versions.

[Example: Consider the following example of an extra color scheme in use in DrawingML:

```
<extraClrScheme>
  <clrScheme name="extraColorSchemeSample">
    <dk1>
      <sysClr val="windowText"/>
    </dk1>
    <lt1>
      <sysClr val="window"/>
    </lt1>
    <dk2>
      <srgbClr val="04617B"/>
    </dk2>
    <lt2>
      <srgbClr val="DBF5F9"/>
    </lt2>
    <accent1>
      <srgbClr val="0F6FC6"/>
    </accent1>
    <accent2>
      <srgbClr val="009DD9"/>
    </accent2>
    <accent3>
      <srgbClr val="0BD0D9"/>
    </accent3>
    <accent4>
      <srgbClr val="10CF9B"/>
    </accent4>
    <accent5>
      <srgbClr val="7CCA62"/>
    </accent5>
    <accent6>
      <srgbClr val="A5C249"/>
    </accent6>
    <hlink>
      <srgbClr val="FF9800"/>
    </hlink>
```

```
<folHlink>
  <srgbClr val="F45511"/>
</folHlink>
</clrScheme>
<clrMap bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
accent6="accent6" hlink="hlink" folHlink="folHlink"/>
</extraClrScheme>
```

In this example, the extra color scheme contains a color scheme and a color map for that color scheme. *end example]*

| Parent Elements |
|-------------------------------|
| extraClrSchemeLst (§20.1.6.5) |

| Child Elements | Subclause |
|--------------------------|-----------|
| clrMap (Color Map) | §20.1.6.1 |
| clrScheme (Color Scheme) | §20.1.6.2 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_ColorSchemeAndMapping](#)) is located in §A.4.1. *end note*]

20.1.6.5 [extraClrSchemeLst \(Extra Color Scheme List\)](#)

This element is a container for the list of extra color schemes present in a document.

| Parent Elements |
|-------------------|
| theme (§20.1.6.9) |

| Child Elements | Subclause |
|-------------------------------------|-----------|
| extraClrScheme (Extra Color Scheme) | §20.1.6.4 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_ColorSchemeList](#)) is located in §A.4.1. *end note*]

20.1.6.6 [masterClrMapping \(Master Color Mapping\)](#)

This element is a part of a choice for which color mapping is used within the document. There is also defined an [overrideClrMapping](#) (§20.1.6.8) element which, when specified, the override is used rather than the color mapping defined in the master. If this element is specified, then we specifically use the color mapping defined in the master.

| Parent Elements |
|-----------------------|
| clrMapOvr (§19.3.1.7) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_EmptyElement](#)) is located in §A.4.1. *end note*]

20.1.6.7 [objectDefaults \(Object Defaults\)](#)

This element allows for the definition of default shape, line, and textbox formatting properties. An application can use this information to format a shape (or text) initially on insertion into a document.

| Parent Elements |
|-------------------|
| theme (§20.1.6.9) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| lnDef (Line Default) | §20.1.4.1.20 |
| spDef (Shape Default) | §20.1.4.1.27 |
| txDef (Text Default) | §20.1.4.1.28 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_ObjectStyleDefaults](#)) is located in §A.4.1. *end note*]

20.1.6.8 [overrideClrMapping \(Override Color Mapping\)](#)

This element provides an override for the color mapping in a document. When defined, this color mapping is used in place of the already defined color mapping, or master color mapping. This color mapping is defined in the same manner as the other mappings within this document.

[*Example:* Consider the following example of an override color mapping in DrawingML:

```
<overrideClrMapping bg1="lt1" tx1="dk1" bg2="lt2" tx2="dk2" accent1="accent1"
  accent2="accent2" accent3="accent3" accent4="accent4" accent5="accent5"
  accent6="accent6" hlink="hlink" folHlink="folHlink"/>
```

end example]

| Parent Elements |
|-----------------------|
| clrMapOvr (§19.3.1.7) |

| Child Elements | Subclause |
|-------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |

| Attributes | Description |
|-------------------------------|--|
| accent1 (Accent 1) | Specifies a color defined which is associated as the accent 1 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent2 (Accent 2) | Specifies a color defined which is associated as the accent 2 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent3 (Accent 3) | Specifies a color defined which is associated as the accent 3 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent4 (Accent 4) | Specifies a color defined which is associated as the accent 4 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent5 (Accent 5) | Specifies a color defined which is associated as the accent 5 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| accent6 (Accent 6) | Specifies a color defined which is associated as the accent 6 color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg1 (Background 1) | A color defined which is associated as the first background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| bg2 (Background 2) | Specifies a color defined which is associated as the second background color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| folHlink (Followed Hyperlink) | Specifies a color defined which is associated as the color for a followed hyperlink. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| hlink (Hyperlink) | Specifies a color defined which is associated as the color for a hyperlink. |

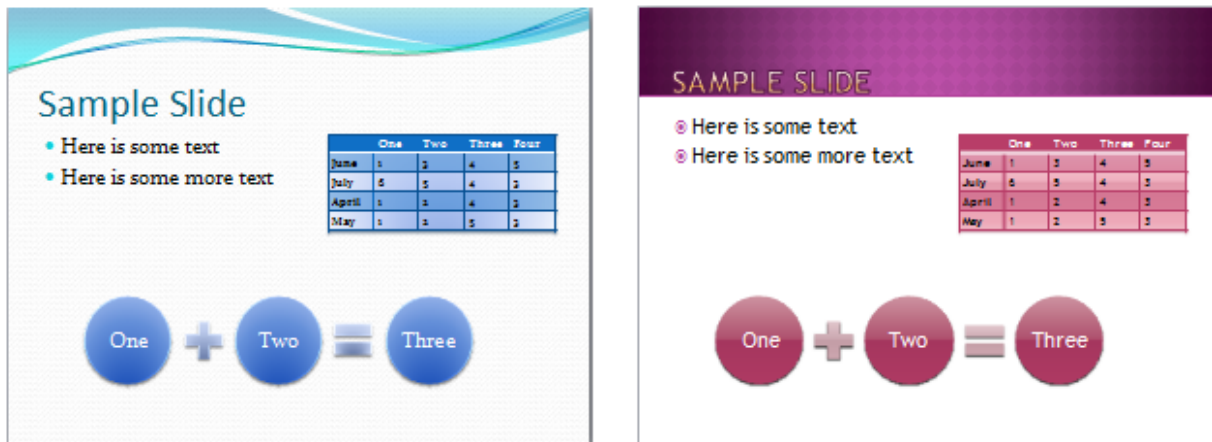

| Attributes | Description |
|--------------|---|
| | The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx1 (Text 1) | Specifies a color defined which is associated as the first text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |
| tx2 (Text 2) | Specifies a color defined which is associated as the second text color. The possible values for this attribute are defined by the ST_ColorSchemeIndex simple type (§20.1.10.14). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ColorMapping](#)) is located in §A.4.1. *end note*]

20.1.6.9 theme (Theme)

This element defines the root level complex type associated with a shared style sheet (or theme). This element holds all the different formatting options available to a document through a theme and defines the overall look and feel of the document when themed objects are used within the document.

[Example: Consider the following image as an example of different themes in use applied to a presentation:

In this example, we see how a theme can affect font, colors, backgrounds, fills, and effects for different objects in a presentation. *end example*]

| Parent Elements |
|--------------------------------------|
| Root element of DrawingML Theme part |

| Child Elements | Subclause |
|---|--------------|
| custClrLst (Custom Color List) | §20.1.6.3 |
| extLst (Extension List) | §20.1.2.2.15 |
| extraClrSchemeLst (Extra Color Scheme List) | §20.1.6.5 |
| objectDefaults (Object Defaults) | §20.1.6.7 |
| themeElements (Theme Elements) | §20.1.6.10 |

| Attributes | Description |
|-------------|---|
| name (Name) | Specifies the name given to the theme. The possible values for this attribute are defined by the W3C XML Schema string datatype. |

[Note: The W3C XML Schema definition of this element’s content model ([CT_OfficeStyleSheet](#)) is located in §A.4.1. *end note*]

20.1.6.10 themeElements (Theme Elements)

This element defines the theme formatting options for the theme and is the workhorse of the theme. This is where the bulk of the shared theme information is contained and used by a document. This element contains the color scheme, font scheme, and format scheme elements which define the different formatting aspects of what a theme defines.

[Example: Consider the following example of a theme elements defined in DrawingML:

```

<themeElements>
  <clrScheme name="sample">
...
  </clrScheme>
  <fontScheme name="sample">
...
  </fontScheme>
  <fmtScheme name="sample">
    <fillStyleLst>
...
    </fillStyleLst>
    <lnStyleLst>
...
    </lnStyleLst>
    <effectStyleLst>
...
    </effectStyleLst>

```

```

    <bgFillStyleLst>
...
    </bgFillStyleLst>
  </fmtScheme>
</themeElements>

```

In this example, we see the basic structure of how a theme elements is defined and have left out the true guts of each individual piece to save room. Each part (color scheme, font scheme, format scheme) is defined elsewhere within DrawingML. *end example*

| Parent Elements |
|-------------------|
| theme (§20.1.6.9) |

| Child Elements | Subclause |
|---------------------------|--------------|
| clrScheme (Color Scheme) | §20.1.6.2 |
| extLst (Extension List) | §20.1.2.2.15 |
| fmtScheme (Format Scheme) | §20.1.4.1.14 |
| fontScheme (Font Scheme) | §20.1.4.1.18 |

[Note: The W3C XML Schema definition of this element's content model ([CT_BaseStyles](#)) is located in §A.4.1. *end note*]

20.1.6.11 themeManager (Theme Manager)

The starting part for a theme file.

[Note: The W3C XML Schema definition of this element's content model ([CT_EmptyElement](#)) is located in §A.4.1. *end note*]

20.1.6.12 themeOverride (Theme Override)

This element allows for an override which changes just the colors, fonts, or effects of a single object, like a table for example. Currently it is used only to control overrides on the non-top-level masters within a presentation.

| Parent Elements |
|---|
| Root element of DrawingML Theme Override part |

| Child Elements | Subclause |
|--------------------------|-----------|
| clrScheme (Color Scheme) | §20.1.6.2 |

| Child Elements | Subclause |
|---------------------------|--------------|
| fmtScheme (Format Scheme) | §20.1.4.1.14 |
| fontScheme (Font Scheme) | §20.1.4.1.18 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_BaseStylesOverride](#)) is located in §A.4.1. *end note*]

20.1.7 Coordinate Systems and Transformations

The following elements are used to reflect dimensions, scaling, location, rotation, and flip information on groups and individual shapes respectively.

20.1.7.1 chExt (Child Extents)

This element specifies the size dimensions of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

| Parent Elements |
|------------------|
| xfrm (§20.1.7.5) |

| Attributes | Description |
|--------------------|--|
| cx (Extent Length) | <p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| cy (Extent Width) | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example</i>: Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple</p> |

| Attributes | Description |
|------------|---------------------|
| | type (§20.1.10.41). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.1.7.2 **chOff (Child Offset)**

This element specifies the location of the child extents rectangle and is used for calculations of grouping, scaling, and rotation behavior of shapes placed within a group.

| Parent Elements |
|------------------|
| xfrm (§20.1.7.5) |

| Attributes | Description |
|-----------------------|---|
| x (X-Axis Coordinate) | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |
| y (Y-Axis Coordinate) | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.1.7.3 `ext` (Extents)

This element specifies the size of the bounding box enclosing the referenced object.

| Parent Elements |
|---|
| xfrm (§21.3.2.28); xfrm (§20.1.7.5); xfrm (§20.1.7.6); xfrm (§20.5.2.36); xfrm (§19.3.1.53) |

| Attributes | Description |
|--------------------|--|
| cx (Extent Length) | <p>Specifies the length of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre><... cx="1828800" cy="200000"/></pre> <p>The cx attributes specifies that this object has a height of 1828800 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| cy (Extent Width) | <p>Specifies the width of the extents rectangle in EMUs. This rectangle shall dictate the size of the object as displayed (the result of any scaling to the original object).</p> <p>[<i>Example:</i> Consider a DrawingML object specified as follows:</p> <pre>< ... cx="1828800" cy="200000"/></pre> <p>The cy attribute specifies that this object has a width of 200000 EMUs (English Metric Units). <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_PositiveSize2D](#)) is located in §A.4.1. *end note*]

20.1.7.4 `off` (Offset)

This element specifies the location of the bounding box of an object. Effects on an object are not included in this bounding box.

| Parent Elements |
|---|
| xfrm (§21.3.2.28); xfrm (§20.1.7.5); xfrm (§20.1.7.6); xfrm (§20.5.2.36); xfrm (§19.3.1.53) |

| Attributes | Description |
|-----------------------|---|
| x (X-Axis Coordinate) | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The x attribute defines an x-coordinate of 0. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |
| y (Y-Axis Coordinate) | <p>Specifies a coordinate on the x-axis. The origin point for this coordinate shall be specified by the parent XML element.</p> <p>[<i>Example:</i> Consider the following point on a basic wrapping polygon for a DrawingML object:</p> <pre><... x="0" y="100" /></pre> <p>The y attribute defines a y-coordinate of 100. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |

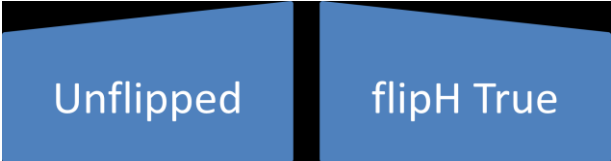

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Point2D](#)) is located in §A.4.1. *end note*]

20.1.7.5 xfrm (2D Transform for Grouped Objects)

This element is nearly identical to the representation of 2-D transforms for ordinary shapes (§20.1.7.6). The only addition is a member to represent the Child offset and the Child extents.

| Parent Elements |
|--|
| grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23) |

| Child Elements | Subclause |
|-----------------------|-----------|
| chExt (Child Extents) | §20.1.7.1 |
| chOff (Child Offset) | §20.1.7.2 |
| ext (Extents) | §20.1.7.3 |
| off (Offset) | §20.1.7.4 |

| Attributes | Description |
|-------------------------|--|
| flipH (Horizontal Flip) | <p>Horizontal flip. When true, this attribute defines that the group is flipped horizontally about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a horizontal flip.</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| flipV (Vertical Flip) | <p>Vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p>[Example: The following illustrates the effect of a vertical flip.</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rot (Rotation) | <p>Rotation. Specifies the clockwise rotation of a group in 1/64000 of a degree.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_GroupTransform2D](#)) is located in §A.4.1. *end note*]

20.1.7.6 [xfrm \(2D Transform for Individual Objects\)](#)

This element represents 2-D transforms for ordinary shapes.

| Parent Elements |
|--|
| graphicFrame (§20.1.2.2.18); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); txSp (§20.1.2.2.41) |

| Child Elements | Subclause |
|----------------|-----------|
| ext (Extents) | §20.1.7.3 |
| off (Offset) | §20.1.7.4 |

| Attributes | Description |
|-------------------------|---|
| flipH (Horizontal Flip) | <p>Specifies a horizontal flip. When true, this attribute defines that the shape is flipped horizontally about the center of its bounding box.</p> <p><i>[Example: The following illustrates the effect of a horizontal flip.</i></p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| flipV (Vertical Flip) | <p>Specifies a vertical flip. When true, this attribute defines that the group is flipped vertically about the center of its bounding box.</p> <p><i>[Example: The following illustrates the effect of a vertical flip.</i></p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rot (Rotation) | <p>Specifies the rotation of the Graphic Frame. The units for which this attribute is specified in reside within the simple type definition referenced below.</p> <p>The possible values for this attribute are defined by the ST_Angle simple type (§20.1.10.3).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Transform2D](#)) is located in §A.4.1.
end note]

20.1.8 Shape Fills, Effects, and Line Properties

This portion of the DrawingML framework describes effects defining the visual appearance of shapes and lines. Shapes can be filled in a variety of ways, with images, solid colors, gradients, or pattern fills. In addition, several visual effects can alter the appearance of a shape, and multiple effects can be combined together. Lines also can have special properties defining how they are rendered, including a dashed appearance or decorations at the line ends. This section documents the elements that define these properties and effects for shapes and lines.

20.1.8.1 alphaBiLevel (Alpha Bi-Level Effect)

This element represents an Alpha Bi-Level Effect.

Alpha (Opacity) values less than the threshold are changed to 0 (fully transparent) and alpha values greater than or equal to the threshold are changed to 100% (fully opaque).

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|--------------------|---|
| thresh (Threshold) | Specifies the threshold value for the alpha bi-level effect. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_AlphaBiLevelEffect](#)) is located in §A.4.1. *end note*]

20.1.8.2 alphaCeiling (Alpha Ceiling Effect)

This element represents an alpha ceiling effect.

Alpha (opacity) values greater than zero are changed to 100%. In other words, anything partially opaque becomes fully opaque.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

[Note: The W3C XML Schema definition of this element’s content model ([CT_AlphaCeilingEffect](#)) is located in §A.4.1. *end note*]

20.1.8.3 alphaFloor (Alpha Floor Effect)

This element represents an alpha floor effect.

Alpha (opacity) values less than 100% are changed to zero. In other words, anything partially transparent becomes fully transparent.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_AlphaFloorEffect](#)) is located in §A.4.1. *end note*]

20.1.8.4 alphaInv (Alpha Inverse Effect)

This element represents an alpha inverse effect.

Alpha (opacity) values are inverted by subtracting from 100%.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_AlphaInverseEffect](#)) is located in §A.4.1. *end note*]

20.1.8.5 alphaMod (Alpha Modulate Effect)

This element represents an alpha modulate effect.

Effect alpha (opacity) values are multiplied by a fixed percentage. The effect container specifies an effect containing alpha values to modulate.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|-------------------------|-------------|
| cont (Effect Container) | \$20.1.8.20 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaModulateEffect](#)) is located in §A.4.1. *end note*]

20.1.8.6 alphaModFix (Alpha Modulate Fixed Effect)

This element represents an alpha modulate fixed effect.

Effect alpha (opacity) values are multiplied by a fixed percentage.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|--------------|---|
| amt (Amount) | Specifies the percentage amount to scale the alpha. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_AlphaModulateFixedEffect](#)) is located in §A.4.1. *end note*]

20.1.8.7 alphaOutset (Alpha Inset/Outset Effect)

This element specifies an alpha outset/inset effect.

This is equivalent to an alpha ceiling, followed by alpha blur, followed by either an alpha ceiling (positive radius) or alpha floor (negative radius).

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|--------------|---|
| rad (Radius) | Specifies the radius of outset/inset. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[Note: The W3C XML Schema definition of this element's content model ([CT_AlphaOutsetEffect](#)) is located in §A.4.1. *end note*]

20.1.8.8 [alphaRepl \(Alpha Replace Effect\)](#)

This element specifies an alpha replace effect.

Effect alpha (opacity) values are replaced by a fixed alpha.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|------------|---|
| a (Alpha) | Specifies the new opacity value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[Note: The W3C XML Schema definition of this element's content model ([CT_AlphaReplaceEffect](#)) is located in §A.4.1. *end note*]

20.1.8.9 [bevel \(Line Join Bevel\)](#)

This element specifies a Bevel Line Join.

A bevel joint specifies that an angle joint is used to connect lines.

[Example:

end example]

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineJoinBevel](#)) is located in §A.4.1. *end note*]

20.1.8.10 [bgClr \(Background color\)](#)

This element specifies the background color of a Pattern fill.

| Parent Elements |
|-----------------------|
| pattFill (§20.1.8.47) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.11 biLevel (Bi-Level (Black/White) Effect)

This element specifies a bi-level (black/white) effect. Input colors whose luminance is less than the specified threshold value are changed to black. Input colors whose luminance are greater than or equal the specified value are set to white. The alpha effect values are unaffected by this effect.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|--------------------|--|
| thresh (Threshold) | Specifies the luminance threshold for the Bi-Level effect. Values greater than or equal to the threshold are set to white. Values lesser than the threshold are set to black. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BiLevelEffect](#)) is located in §A.4.1. *end note*]

20.1.8.12 blend (Blend Effect)

This element specifies a blend of several effects. The container specifies the raw effects to blend while the blend mode specifies how the effects are to be blended.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|-------------------------|------------|
| cont (Effect Container) | §20.1.8.20 |

| Attributes | Description |
|--------------------|--|
| blend (Blend Mode) | Specifies how to blend the two effects. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11). |

[Note: The W3C XML Schema definition of this element's content model ([CT_BlendEffect](#)) is located in §A.4.1.
end note]

20.1.8.13 blip (Blip)

This element specifies the existence of an image (binary large image or picture) and contains a reference to the image data.

| Parent Elements |
|---|
| blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4); buBlip (§21.1.2.4.2) |

| Child Elements | Subclause |
|---|------------|
| alphaBiLevel (Alpha Bi-Level Effect) | §20.1.8.1 |
| alphaCeiling (Alpha Ceiling Effect) | §20.1.8.2 |
| alphaFloor (Alpha Floor Effect) | §20.1.8.3 |
| alphaInv (Alpha Inverse Effect) | §20.1.8.4 |
| alphaMod (Alpha Modulate Effect) | §20.1.8.5 |
| alphaModFix (Alpha Modulate Fixed Effect) | §20.1.8.6 |
| alphaRepl (Alpha Replace Effect) | §20.1.8.8 |
| biLevel (Bi-Level (Black/White) Effect) | §20.1.8.11 |
| blur (Blur Effect) | §20.1.8.15 |
| clrChange (Color Change Effect) | §20.1.8.16 |
| clrRepl (Solid Color Replacement) | §20.1.8.18 |
| duotone (Duotone Effect) | §20.1.8.23 |

| Child Elements | Subclause |
|---------------------------------------|--------------|
| extLst (Extension List) | §20.1.2.2.15 |
| fillOverlay (Fill Overlay Effect) | §20.1.8.29 |
| grayscale (Gray Scale Effect) | §20.1.8.34 |
| hsl (Hue Saturation Luminance Effect) | §20.1.8.39 |
| lum (Luminance Effect) | §20.1.8.42 |
| tint (Tint Effect) | §20.1.8.60 |

| Attributes | Description |
|---|---|
| cstate (Compression State) | Specifies the compression state with which the picture is stored. This allows the application to specify the amount of compression that has been applied to a picture. The possible values for this attribute are defined by the ST_BlipCompression simple type (§20.1.10.12). |
| embed (Embedded Picture Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the identification information for an embedded picture. This attribute is used to specify an image that resides locally within the file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |
| link (Linked Picture Reference) Namespace: http://purl.oclc.org/ooxml/officeDocument/relationships | Specifies the identification information for a linked picture. This attribute is used to specify an image that does not reside within this file. The possible values for this attribute are defined by the ST_RelationshipId simple type (§22.8.2.1). |

[Note: The W3C XML Schema definition of this element's content model ([CT_Blip](#)) is located in §A.4.1. *end note*]

20.1.8.14 blipFill (Picture Fill)

This element specifies the type of picture fill that the picture object has. Because a picture has a picture fill already by default, it is possible to have two fills specified for a picture object. An example of this is shown below.

[Example: Consider the picture below that has a blip fill applied to it. The image used to fill this picture object has transparent pixels instead of white pixels.

```

<p:pic>
...
<p:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect/>
  </a:stretch>
</p:blipFill>
...
</p:pic>

```

The above picture object is shown as an example of this fill type. *end example*]

[*Example:* Consider now the same picture object but with an additional gradient fill applied within the shape properties portion of the picture.

```

<p:pic>
...
<p:blipFill>

| srcRect (Source Rectangle) | §20.1.8.55 |
| stretch (Stretch) | §20.1.8.56 |

| Child Elements | Subclause |
|----------------|------------|
| tile (Tile) | §20.1.8.58 |

| Attributes | Description |
|----------------------------------|---|
| dpi (DPI Setting) | <p>Specifies the DPI (dots per inch) used to calculate the size of the blip. If not present or zero, the DPI in the blip is used.</p> <p>[<i>Note:</i> This attribute is primarily used to keep track of the picture quality within a document. There are different levels of quality needed for print than on-screen viewing and thus a need to track this information. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the W3C XML Schema unsignedInt datatype.</p> |
| rotWithShape (Rotate With Shape) | <p>Specifies that the fill should rotate with the shape. That is, when the shape that has been filled with a picture and the containing shape (say a rectangle) is transformed with a rotation then the fill is transformed with the same rotation.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_BlipFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.15 blur (Blur Effect)

This element specifies a blur effect that is applied to the entire shape, including its fill. All color channels, including alpha, are affected.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Attributes | Description |
|--------------------|--|
| grow (Grow Bounds) | <p>Specifies whether the bounds of the object should be grown as a result of the blurring. True indicates the bounds are grown while false indicates that they are not.</p> <p>[<i>Example:</i></p> <p>With grow set to false, the blur effect does not extend beyond the original bounds of the object:</p> |

| Attributes | Description |
|--------------|---|
| |  <p>With grow set to true, the blur effect can extend beyond the original bounds of the object:</p>  <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| rad (Radius) | <p>Specifies the radius of blur.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_BlurEffect](#)) is located in §A.4.1. *end note*]

20.1.8.16 [clrChange \(Color Change Effect\)](#)

This element specifies a Color Change Effect. Instances of clrFrom are replaced with instances of clrTo.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|-----------------------------|------------|

| outerShdw (Outer Shadow Effect) | §20.1.8.45 |
| prstShdw (Preset Shadow) | §20.1.8.49 |
| reflection (Reflection Effect) | §20.1.8.50 |
| relOff (Relative Offset Effect) | §20.1.8.51 |
| softEdge (Soft Edge Effect) | §20.1.8.53 |
| tint (Tint Effect) | §20.1.8.60 |
| xfrm (Transform Effect) | §20.1.8.61 |

| Attributes | Description |
|-------------|---|
| name (Name) | <p>Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers.</p> <p>The possible values for this attribute are defined by the W3C XML Schema token datatype.</p> |

| Attributes | Description |
|------------------------------|---|
| type (Effect Container Type) | Specifies the kind of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22). |

[Note: The W3C XML Schema definition of this element's content model ([CT_EffectContainer](#)) is located in §A.4.1. *end note*]

20.1.8.21 [custDash \(Custom Dash\)](#)

This element specifies a custom dashing scheme. It is a list of dash stop elements which represent building block atoms upon which the custom dashing scheme is built.

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

| Child Elements | Subclause |
|----------------|------------|
| ds (Dash Stop) | §20.1.8.22 |

[Note: The W3C XML Schema definition of this element's content model ([CT_DashStopList](#)) is located in §A.4.1. *end note*]

20.1.8.22 [ds \(Dash Stop\)](#)

This element specifies a dash stop primitive. Dashing schemes are built by specifying an ordered list of dash stop primitive. A dash stop primitive consists of a dash and a space.

| Parent Elements |
|-----------------------|
| custDash (§20.1.8.21) |

| Attributes | Description |
|-------------------|--|
| d (Dash Length) | Specifies the length of the dash relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45). |
| sp (Space Length) | Specifies the length of the space relative to the line width. The possible values for this attribute are defined by the ST_PositivePercentage simple |

| Attributes | Description |
|------------|---------------------|
| | type (§20.1.10.45). |

[*Note: The W3C XML Schema definition of this element's content model ([CT_DashStop](#)) is located in §A.4.1. end note*]

20.1.8.23 duotone (Duotone Effect)

This element specifies a duotone effect.

For each pixel, combines clr1 and clr2 through a linear interpolation to determine the new color for that pixel.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[*Note: The W3C XML Schema definition of this element's content model ([CT_DuotoneEffect](#)) is located in §A.4.1. end note*]

20.1.8.24 effect (Effect)

This element specifies a reference to an existing effect container.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|-----------------|---|
| ref (Reference) | Specifies the reference. Its value can be the name of an effect container, or one of four special references: fill - refers to the fill effect line - refers to the line effect fillLine - refers to the combined fill and line effects children - refers to the combined effects from logical child shapes or text |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema token datatype. |

[Note: The W3C XML Schema definition of this element's content model ([CT EffectReference](#)) is located in §A.4.1. *end note*]

20.1.8.25 effectDag (Effect Container)

This element specifies a list of effects. Effects are applied in the order specified by the container type (sibling or tree).

[Note: An effectDag element can contain multiple effect containers as child elements. Effect containers with different styles can be combined in an effectDag to define a directed acyclic graph (DAG) that specifies the order in which all effects are applied. *end note*]

| name (Name) | Specifies an optional name for this list of effects, so that it can be referred to later. Shall be unique across all effect trees and effect containers. The possible values for this attribute are defined by the W3C XML Schema token datatype. |
| type (Effect Container Type) | Specifies the kind of container, either sibling or tree. The possible values for this attribute are defined by the ST_EffectContainerType simple type (§20.1.10.22). |

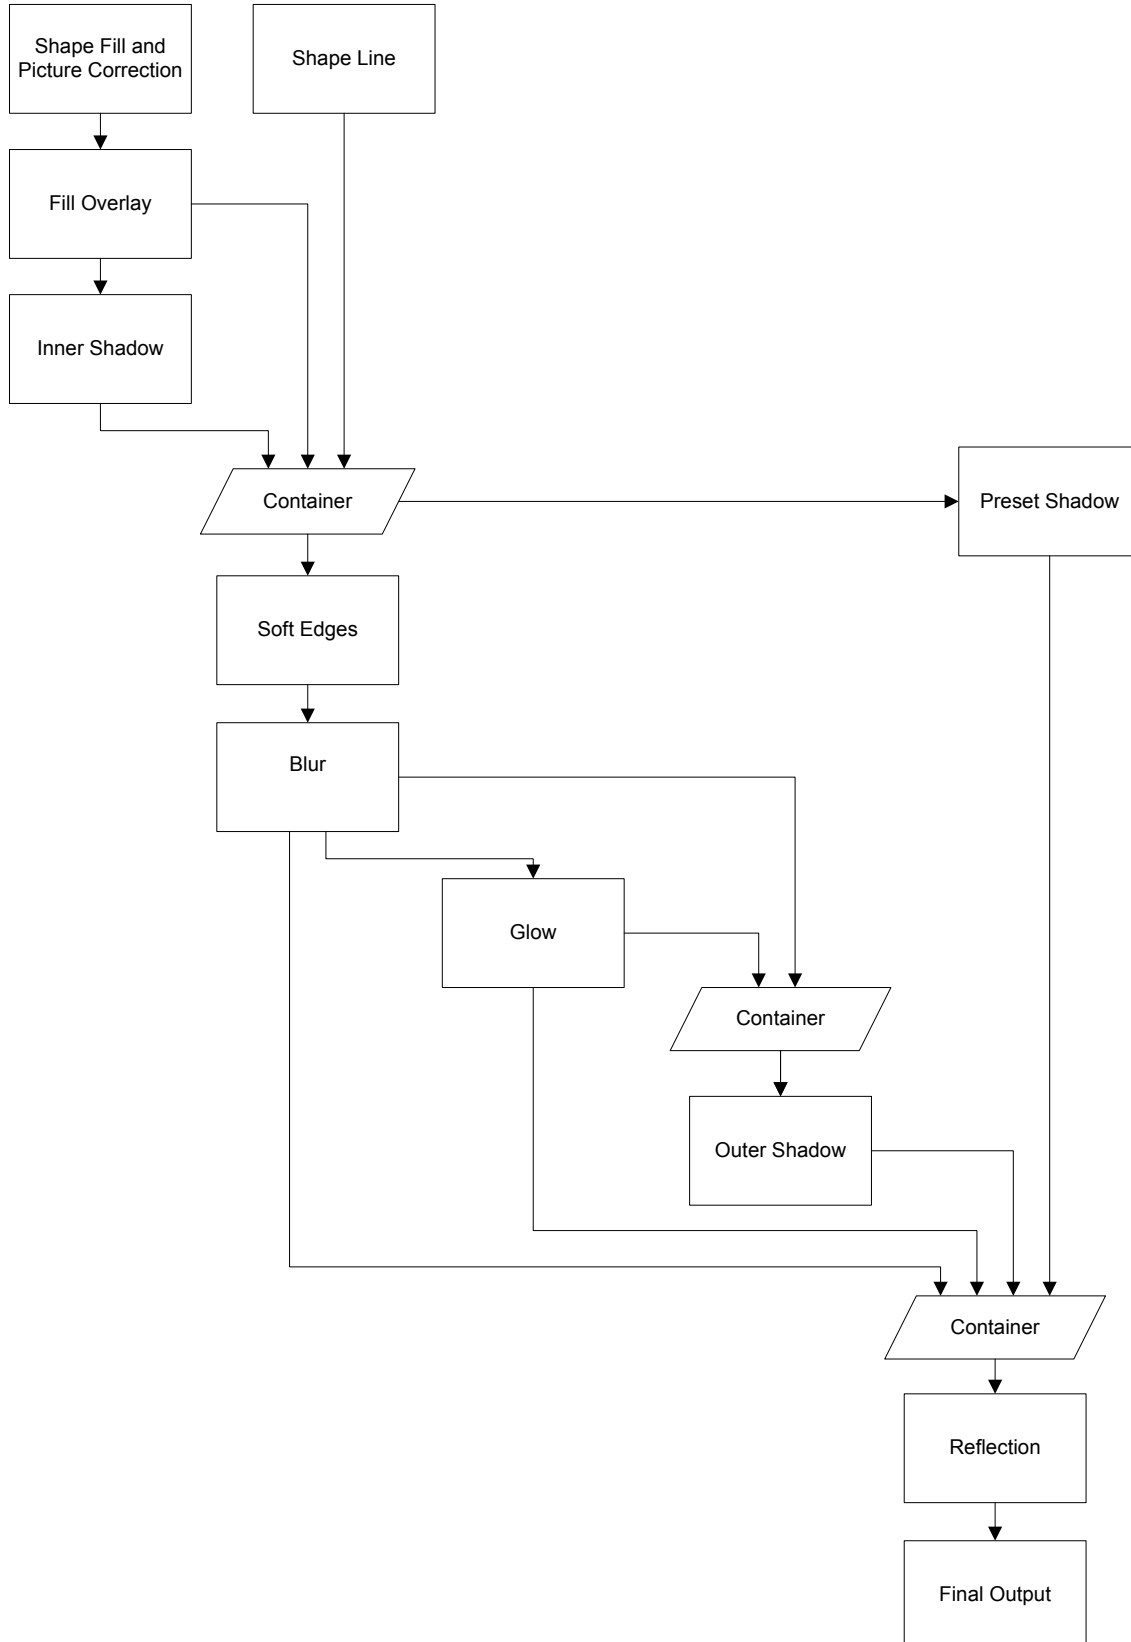

[Note: The W3C XML Schema definition of this element's content model ([CT_EffectContainer](#)) is located in §A.4.1. *end note*]

20.1.8.26 effectLst (Effect Container)

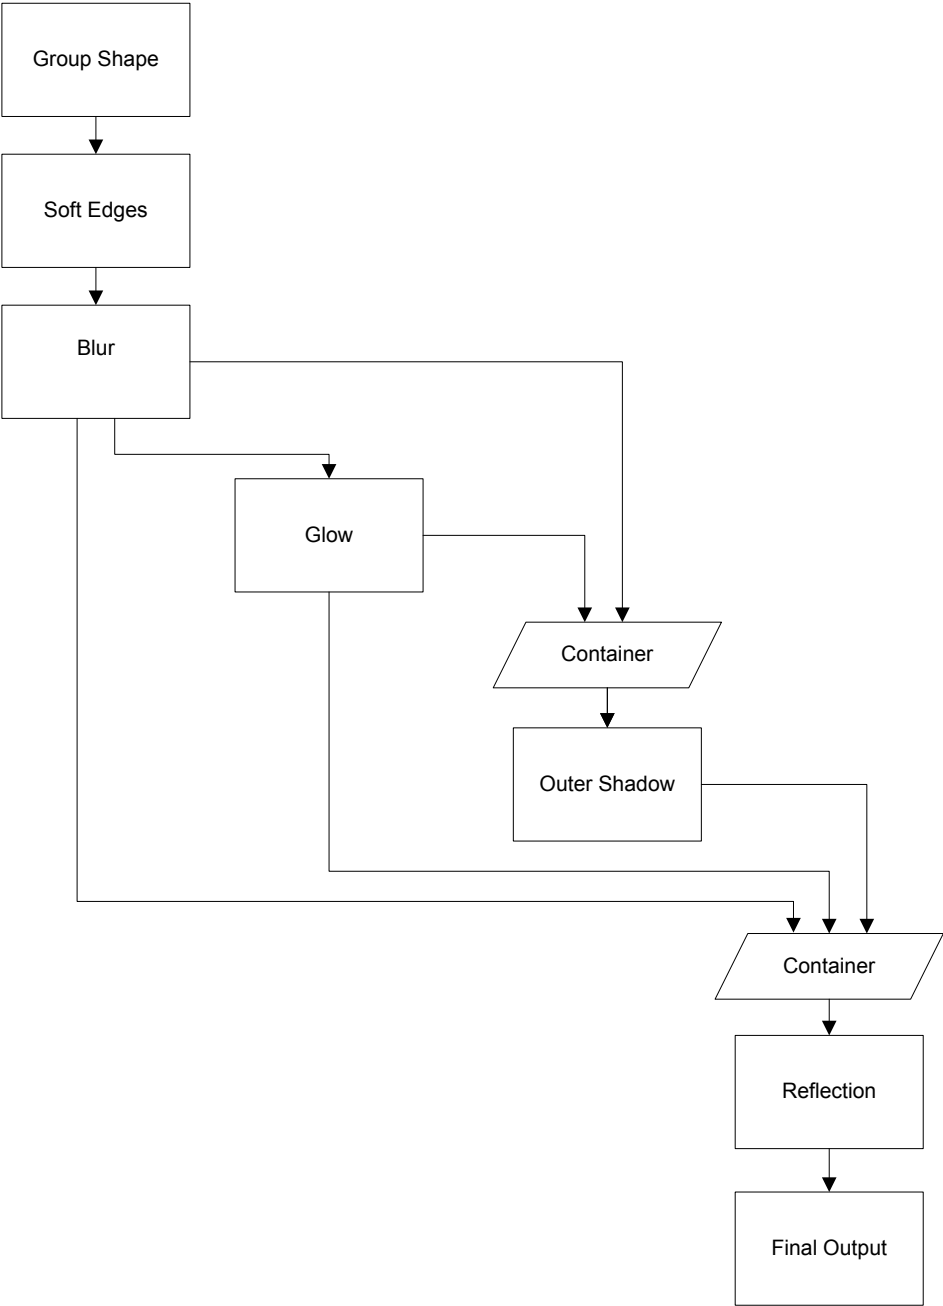

This element specifies a list of effects. Effects in an effectLst are applied in the default order by the rendering engine. The following diagrams illustrate the order in which effects are applied, both for shapes and for group shapes.

[*Note*: The output of many effects does not include the input shape. For effects that should be applied to the result of previous effects as well as the original shape, a container is used to group the inputs together. *end note*]

[*Example*: Outer Shadow is applied both to the original shape and the original shape's glow. The result of blur contains the original shape, while the result of glow contains only the added glow. Therefore, a container that groups the blur result with the glow result is used as the input to Outer Shadow. *end example*]

[Note: The W3C XML Schema definition of this element's content model ([CT_EffectList](#)) is located in §A.4.1. *end note*]

20.1.8.27 fgClr (Foreground color)

This element specifies the foreground color of a pattern fill.

| Parent Elements |
|-----------------------|
| pattFill (§20.1.8.47) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

[Note: The W3C XML Schema definition of this element's content model ([CT_Color](#)) is located in §A.4.1. *end note*]

20.1.8.28 fill (Fill)

This element specifies a fill which is one of blipFill, gradFill, grpFill, noFill, pattFill or solidFill.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Child Elements | Subclause |
|--------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

[Note: The W3C XML Schema definition of this element's content model ([CT_FillEffect](#)) is located in §A.4.1. *end note*]

20.1.8.29 fillOverlay (Fill Overlay Effect)

This element specifies a fill overlay effect. A fill overlay can be used to specify an additional fill for an object and blend the two fills together.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Child Elements | Subclause |
|--------------------------|------------|
| blipFill (Picture Fill) | §20.1.8.14 |
| gradFill (Gradient Fill) | §20.1.8.33 |
| grpFill (Group Fill) | §20.1.8.35 |
| noFill (No Fill) | §20.1.8.44 |
| pattFill (Pattern Fill) | §20.1.8.47 |
| solidFill (Solid Fill) | §20.1.8.54 |

| Attributes | Description |
|---------------|--|
| blend (Blend) | Specifies how to blend the fill with the base effect. The possible values for this attribute are defined by the ST_BlendMode simple type (§20.1.10.11). |

[Note: The W3C XML Schema definition of this element's content model ([CT_FillOverlayEffect](#)) is located in §A.4.1. *end note*]

20.1.8.30 fillRect (Fill Rectangle)

This element specifies a fill rectangle. When stretching of an image is specified, a source rectangle, srcRect, is scaled to fit the specified fill rectangle.

Each edge of the fill rectangle is defined by a percentage offset from the corresponding edge of the shape's bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. *[Note: For example, a left offset of 25% specifies that the left edge of the fill rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. end note]*

[Example:

```
<a:blipFill>
  <a:blip r:embed="rId2"/>
  <a:stretch>
    <a:fillRect b="10000" r="25000"/>
  </a:stretch>
</a:blipFill>
```

The above image is stretched to fill the entire rectangle except for the bottom 10% and rightmost 25%.

end example]

| Parent Elements |
|----------------------|
| stretch (§20.1.8.56) |

| Attributes | Description |
|-------------------|---|
| b (Bottom Offset) | Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| l (Left Offset) | Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| r (Right Offset) | Specifies the right edge of the rectangle. |

| Attributes | Description |
|----------------|--|
| | The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| t (Top Offset) | Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_RelativeRect](#)) is located in §A.4.1. *end note*]

20.1.8.31 fillToRect (Fill To Rectangle)

This element defines the "focus" rectangle for the center shade, specified relative to the fill tile rectangle. The center shade fills the entire tile except the margins specified by each attribute.

Each edge of the center shade rectangle is defined by a percentage offset from the corresponding edge of the tile rectangle. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note:* For example, a left offset of 25% specifies that the left edge of the center shade rectangle is located to the right of the tile rectangle's left edge by an amount equal to 25% of the tile rectangle's width. *end note*]

[*Example:*

```
<a:path path="rect">  
  <a:fillToRect l="50000" r="50000" t="50000" b="50000"/>  
</a:path>
```

In the above shape, the rectangle defined by fillToRect is a single point in the center of the shape. This creates the effect of the center shade focusing at a point in the center of the region.

end example]

[*Example:*

```
<a:path path="rect">
```

```
<a:fillToRect l="25000" t="25000" r="25000" b="0"/>
</a:path>
```

The center shade occupies the rectangle defined by excluding the topmost, leftmost, and rightmost 25% of the region. Therefore, the gradient fills the remaining leftmost 25%, topmost 25%, and rightmost 25% of the region.

end example]

| Parent Elements |
|-------------------|
| path (§20.1.8.46) |

| Attributes | Description |
|-------------------|---|
| b (Bottom Offset) | Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| l (Left Offset) | Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| r (Right Offset) | Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| t (Top Offset) | Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_RelativeRect](#)) is located in §A.4.1.
end note]

20.1.8.32 glow (Glow Effect)

This element specifies a glow effect, in which a color blurred outline is added outside the edges of the object.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |

| Child Elements | Subclause |

| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|--------------|---|
| rad (Radius) | Specifies the radius of the glow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |

[Note: The W3C XML Schema definition of this element's content model ([CT_GlowEffect](#)) is located in §A.4.1. end note]

20.1.8.33 [gradFill \(Gradient Fill\)](#)

This element defines a gradient fill.

A gradient fill is a fill which is characterized by a smooth gradual transition from one color to the next. At its simplest, it is a fill which transitions between two colors; or more generally, it can be a transition of any number of colors.

The desired transition colors and locations are defined in the gradient stop list (gsLst) child element.

The other child element defines the properties of the gradient fill (there are two styles-- a linear shade style as well as a path shade style)

[Example:

The following is a sample gradient fill, varying from blue to white:

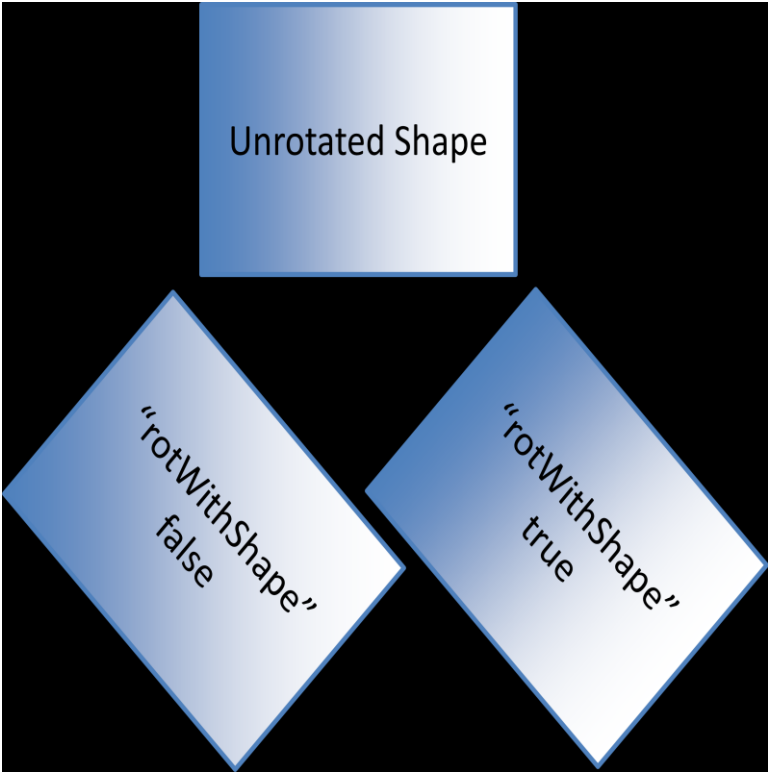

end example]

| Parent Elements |
|--|
| bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14) |

| Child Elements | Subclause |

| lin (Linear Gradient Fill) | §20.1.8.41 |
| path (Path Gradient) | §20.1.8.46 |
| tileRect (Tile Rectangle) | §20.1.8.59 |

| Attributes | Description |
|----------------------------------|---|
| flip (Tile Flip) | <p>Specifies the direction(s) in which to flip the gradient while tiling.</p> <p>Normally a gradient fill encompasses the entire bounding box of the shape which contains the fill. However, with the tileRect element, it is possible to define a "tile" rectangle which is smaller than the bounding box. In this situation, the gradient fill is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.</p> <p>The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).</p> |
| rotWithShape (Rotate With Shape) | <p>Specifies if a fill rotates along with a shape when the shape is rotated.</p> <p><i>[Example:</i></p> <p>The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.</p> |

| Attributes | Description |
|------------|---|
| | <div></div> <p><i>end example]</i></p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GradientFillProperties](#)) is located in §A.4.1. *end note]*

20.1.8.34 **grayscale (Gray Scale Effect)**

This element specifies a gray scale effect. Converts all effect color values to a shade of gray, corresponding to their luminance. Effect alpha (opacity) values are unaffected.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

[Note: The W3C XML Schema definition of this element's content model ([CT_GrayscaleEffect](#)) is located in §A.4.1. *end note*]

20.1.8.35 grpFill (Group Fill)

This element specifies a group fill. When specified, this setting indicates that the parent element is part of a group and should inherit the fill properties of the group.

| Parent Elements |
|--|
| bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12) |

[Note: The W3C XML Schema definition of this element's content model ([CT_GroupFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.36 gs (Gradient stops)

This element defines a gradient stop. A gradient stop consists of a position where the stop appears in the color band.

| Parent Elements |
|--------------------|
| gsLst (§20.1.8.37) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|----------------|--|
| pos (Position) | Specifies where this gradient stop should appear in the color band. This position is |

| Attributes | Description |
|------------|---|
| | <p>specified in the range [0%, 100%], which corresponds to the beginning and the end of the color band respectively.</p> <p>The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_GradientStop](#)) is located in §A.4.1. *end note*]

20.1.8.37 [gsLst \(Gradient Stop List\)](#)

The list of gradient stops that specifies the gradient colors and their relative positions in the color band.

| Parent Elements |
|-----------------------|
| gradFill (§20.1.8.33) |

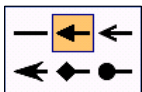

| Child Elements | Subclause |
|---------------------|------------|
| gs (Gradient stops) | §20.1.8.36 |

[Note: The W3C XML Schema definition of this element's content model ([CT_GradientStopList](#)) is located in §A.4.1. *end note*]

20.1.8.38 [headEnd \(Line Head/End Style\)](#)

This element specifies decorations which can be added to the head of a line.

[Example:

end example]

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

| Attributes | Description |
|--------------------------|--|
| len (Length of Head/End) | Specifies the line end length in relation to the line width. |

| Attributes | Description |
|---------------------------|--|
| | The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32). |
| type (Line Head/End Type) | Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33). |
| w (Width of Head/End) | Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34). |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineEndProperties](#)) is located in §A.4.1. *end note*]

20.1.8.39 hsl (Hue Saturation Luminance Effect)

This element specifies a hue/saturation/luminance effect. The hue, saturation, and luminance can each be adjusted relative to its current value.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|------------------|---|
| hue (Hue) | Specifies the number of degrees by which the hue is adjusted. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| lum (Luminance) | Specifies the percentage by which the luminance is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |
| sat (Saturation) | Specifies the percentage by which the saturation is adjusted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |

[Note: The W3C XML Schema definition of this element's content model ([CT_HSLEffect](#)) is located in §A.4.1. *end note*]

20.1.8.40 `innerShdw` (Inner Shadow Effect)

This element specifies an inner shadow effect. A shadow is applied within the edges of the object according to the parameters given by the attributes.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|-----------------------|---|
| blurRad (Blur Radius) | Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| dir (Direction) | Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| dist (Distance) | Specifies how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |

[Note: The W3C XML Schema definition of this element's content model ([CT_InnerShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.41 `lin` (Linear Gradient Fill)

This element specifies a linear gradient.

| Parent Elements |
|------------------------------------|
| <code>gradFill</code> (§20.1.8.33) |

| Attributes | Description |
|------------------------------|--|
| <code>ang</code> (Angle) | <p>Specifies the direction of color change for the gradient. To define this angle, let its value be x measured clockwise. Then $(-\sin x, \cos x)$ is a vector parallel to the line of constant color in the gradient fill.</p> <p>The possible values for this attribute are defined by the <code>ST_PositiveFixedAngle</code> simple type (§20.1.10.43).</p> |
| <code>scaled</code> (Scaled) | <p>Whether the gradient angle scales with the fill region. Mathematically, if this flag is true, then the gradient vector $(\cos x, \sin x)$ is scaled by the width (w) and height (h) of the fill region, so that the vector becomes $(w \cos x, h \sin x)$ (before normalization). Observe that now if the gradient angle is 45 degrees, the gradient vector is (w, h), which goes from top-left to bottom-right of the fill region. If this flag is false, the gradient angle is independent of the fill region and is not scaled using the manipulation described above. So a 45-degree gradient angle always give a gradient band whose line of constant color is parallel to the vector $(1, -1)$.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_LinearShadeProperties](#)) is located in §A.4.1. *end note*]

20.1.8.42 `lum` (Luminance Effect)

This element specifies a luminance effect. Brightness linearly shifts all colors closer to white or black. Contrast scales all colors to be either closer or further apart.

| Parent Elements |
|---|
| <code>blip</code> (§20.1.8.13); <code>cont</code> (§20.1.8.20); <code>effectDag</code> (§20.1.8.25) |

| Attributes | Description |
|----------------------------------|--|
| <code>bright</code> (Brightness) | <p>Specifies the percent to change the brightness.</p> <p>The possible values for this attribute are defined by the <code>ST_FixedPercentage</code> simple type (§20.1.10.24).</p> |

| Attributes | Description |
|---------------------|--|
| contrast (Contrast) | Specifies the percent to change the contrast. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |

[Note: The W3C XML Schema definition of this element's content model ([CT_LuminanceEffect](#)) is located in §A.4.1. *end note*]

20.1.8.43 **miter (Miter Line Join)**

This element specifies that a line join shall be mitered.

[Example: The following sample illustrated two lines which are joined using a mitered style

end example]

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

| Attributes | Description |
|------------------------|---|
| lim (Miter Join Limit) | Specifies the amount by which lines is extended to form a miter join - otherwise miter joins can extend infinitely far (for lines which are almost parallel). The possible values for this attribute are defined by the ST_PositivePercentage simple type (§20.1.10.45). |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineJoinMiterProperties](#)) is located in §A.4.1. *end note*]

20.1.8.44 **noFill (No Fill)**

This element specifies that no fill is applied to the parent element.

| Parent Elements |
|--|
| bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr |

| Parent Elements |
|---|
| (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14) |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_NoFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.45 outerShdw (Outer Shadow Effect)

This element specifies an Outer Shadow Effect.

[*Example:* The following is an example of an outer shadow effect.

end example]

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |
| prstClr (Preset Color) | §20.1.2.3.22 |
| schemeClr (Scheme Color) | §20.1.2.3.29 |
| scrgbClr (RGB Color Model - Percentage Variant) | §20.1.2.3.30 |
| srgbClr (RGB Color Model - Hex Variant) | §20.1.2.3.32 |
| sysClr (System Color) | §20.1.2.3.33 |

| Attributes | Description |
|------------------------|--|
| aln (Shadow Alignment) | Specifies shadow alignment; alignment happens first, effectively setting the origin for scale, skew, and offset. The possible values for this attribute are defined by the ST_RectAlignment simple type |

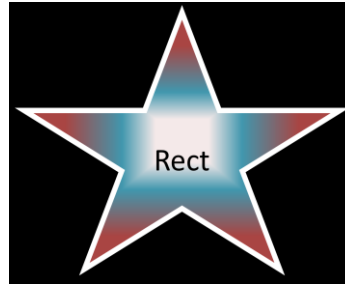

| Attributes | Description |
|----------------------------------|--|
| | (§20.1.10.52). |
| blurRad (Blur Radius) | Specifies the blur radius of the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| dir (Shadow Direction) | Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| dist (Shadow Offset Distance) | Specifies the how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| kx (Horizontal Skew) | Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| ky (Vertical Skew) | Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| rotWithShape (Rotate With Shape) | Specifies whether the shadow rotates with the shape if the shape is rotated. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| sx (Horizontal Scaling Factor) | Specifies the horizontal scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| sy (Vertical Scaling Factor) | Specifies the vertical scaling factor; negative scaling causes a flip. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_OuterShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.46 path (Path Gradient)

This element defines that a gradient fill follows a path vs. a linear line.

[*Example:*

The examples above illustrate gradient fills following a circular, rectangular or shape path.

end example]

| Parent Elements |
|-----------------------|
| gradFill (§20.1.8.33) |

| Child Elements | Subclause |
|--------------------------------|------------|
| fillToRect (Fill To Rectangle) | §20.1.8.31 |

| Attributes | Description |
|---------------------------|---|
| path (Gradient Fill Path) | Specifies the shape of the path to follow. The possible values for this attribute are defined by the ST_PathShadeType simple type (§20.1.10.38). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PathShadeProperties](#)) is located in §A.4.1. *end note*]

20.1.8.47 `pattFill` (Pattern Fill)

This element specifies a pattern fill. A repeated pattern is used to fill the object.

| Parent Elements |
|--|
| bg (§21.4.3.1); bgFillStyleLst (§20.1.4.1.7); bgPr (§19.3.1.2); defRPr (§21.1.2.3.2); endParaRPr (§21.1.2.2.3); fill (§20.1.8.28); fill (§20.1.4.2.9); fillOverlay (§20.1.8.29); fillStyleLst (§20.1.4.1.13); grpSpPr (§21.3.2.14); grpSpPr (§20.1.2.2.22); grpSpPr (§20.5.2.18); grpSpPr (§19.3.1.23); ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); rPr (§21.1.2.3.9); spPr (§21.2.2.197); spPr (§21.3.2.23); spPr (§21.4.3.7); spPr (§20.1.2.2.35); spPr (§20.2.2.6); spPr (§20.5.2.30); spPr (§19.3.1.44); tblPr (§21.1.3.15); tcPr (§21.1.3.17); uFill (§21.1.2.3.12); uLn (§21.1.2.3.14) |

| Child Elements | Subclause |
|--------------------------|------------|
| bgClr (Background color) | §20.1.8.10 |
| fgClr (Foreground color) | §20.1.8.27 |

| Attributes | Description |
|-----------------------|---|
| prst (Preset Pattern) | Specifies one of a set of preset patterns to fill the object. The possible values for this attribute are defined by the ST_PresetPatternVal simple type (§20.1.10.50). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PatternFillProperties](#)) is located in §A.4.1. *end note*]

20.1.8.48 `prstDash` (Preset Dash)

This element specifies that a preset line dashing scheme should be used.

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

| Attributes | Description |
|-------------|---|
| val (Value) | Specifies which preset dashing scheme is to be used. The possible values for this attribute are defined by the ST_PresetLineDashVal simple type (§20.1.10.48). |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PresetLineDashProperties](#)) is located in §A.4.1. *end note*]

20.1.8.49 prstShdw (Preset Shadow)

This element specifies that a preset shadow is to be used. Each preset shadow is equivalent to a specific outer shadow effect. For each preset shadow, the color element, direction attribute, and distance attribute represent the color, direction, and distance parameters of the corresponding outer shadow. Additionally, the rotateWithShape attribute of corresponding outer shadow is always false. Other non-default parameters of the outer shadow are dependent on the prst attribute.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Child Elements | Subclause |
|---|--------------|
| hslClr (Hue, Saturation, Luminance Color Model) | §20.1.2.3.13 |

| Attributes | Description |
|----------------------|---|
| dir (Direction) | Specifies the direction to offset the shadow. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| dist (Distance) | Specifies how far to offset the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| prst (Preset Shadow) | Specifies which preset shadow to use. The possible values for this attribute are defined by the ST_PresetShadowVal simple type (§20.1.10.51). |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_PresetShadowEffect](#)) is located in §A.4.1. *end note*]

20.1.8.50 reflection (Reflection Effect)

This element specifies a reflection effect.

[Example:

end example]

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Attributes | Description |
|-------------------------|--|
| algn (Shadow Alignment) | Specifies shadow alignment. The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52). |
| blurRad (Blur Radius) | Specifies the blur radius. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| dir (Direction) | Specifies the direction of the alpha gradient ramp relative to the shape itself. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| dist (Distance) | Specifies how far to distance the shadow. The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41). |
| endA (End Alpha) | Specifies the ending reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |
| endPos (End | Specifies the end position (along the alpha gradient ramp) of the end alpha value. |

| Attributes | Description |
|----------------------------------|---|
| Position) | The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |
| fadeDir (Fade Direction) | Specifies the direction to offset the reflection. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |
| kx (Horizontal Skew) | Specifies the horizontal skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| ky (Vertical Skew) | Specifies the vertical skew angle. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| rotWithShape (Rotate With Shape) | Specifies if the reflection rotates with the shape. The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| stA (Start Opacity) | starting reflection opacity. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |
| stPos (Start Position) | Specifies the start position (along the alpha gradient ramp) of the start alpha value. The possible values for this attribute are defined by the ST_PositiveFixedPercentage simple type (§20.1.10.44). |
| sx (Horizontal Ratio) | Specifies the horizontal scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| sy (Vertical Ratio) | Specifies the vertical scaling factor. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_ReflectionEffect](#)) is located in §A.4.1. *end note*]

20.1.8.51 relOff (Relative Offset Effect)

This element specifies a relative offset effect. Sets up a new origin by offsetting relative to the size of the previous effect.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|---------------|---|
| tx (Offset X) | Specifies the X offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| ty (Offset Y) | Specifies the Y offset. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_RelativeOffsetEffect](#)) is located in §A.4.1. *end note*]

20.1.8.52 round (Round Line Join)

This element specifies that lines joined together have a round join.

[Example:

end example]

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineJoinRound](#)) is located in §A.4.1. *end note*]

20.1.8.53 softEdge (Soft Edge Effect)

This element specifies a soft edge effect. The edges of the shape are blurred, while the fill is not affected.

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25); effectLst (§20.1.8.26) |

| Attributes | Description |

20.1.8.55 [srcRect \(Source Rectangle\)](#)

This element specifies the portion of the blip used for the fill.

Each edge of the source rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [Note: For example, a left offset of 25% specifies that the left edge of the source rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

| Parent Elements |

|---------------------------|------------|
| fillRect (Fill Rectangle) | §20.1.8.30 |

[Note: The W3C XML Schema definition of this element's content model ([CT_StretchInfoProperties](#)) is located in §A.4.1. *end note*]

20.1.8.57 [tailEnd \(Tail line end style\)](#)

This element specifies decorations which can be added to the tail of a line.

[Example:

end example]

| Parent Elements |
|--|
| ln (§20.1.2.2.24); lnB (§21.1.3.5); lnBlToTr (§21.1.3.6); lnL (§21.1.3.7); lnR (§21.1.3.8); lnT (§21.1.3.9); lnTlToBr (§21.1.3.10); uLn (§21.1.2.3.14) |

| Attributes | Description |
|---------------------------|--|
| len (Length of Head/End) | Specifies the line end length in relation to the line width. The possible values for this attribute are defined by the ST_LineEndLength simple type (§20.1.10.32). |
| type (Line Head/End Type) | Specifies the line end decoration, such as a triangle or arrowhead. The possible values for this attribute are defined by the ST_LineEndType simple type (§20.1.10.33). |
| w (Width of Head/End) | Specifies the line end width in relation to the line width. The possible values for this attribute are defined by the ST_LineEndWidth simple type (§20.1.10.34). |

[Note: The W3C XML Schema definition of this element's content model ([CT_LineEndProperties](#)) is located in §A.4.1. end note]

20.1.8.58 tile (Tile)

This element specifies that a BLIP should be tiled to fill the available space. This element defines a "tile" rectangle within the bounding box. The image is encompassed within the tile rectangle, and the tile rectangle is tiled across the bounding box to fill the entire area.

[Example:

The following is a fill with the flip attribute set to "x". The black interior rectangle indicates the tile rectangle. Notice that the adjacent rectangle to the right in the tile has been flipped along the x-axis.

end example]

| Parent Elements |
|---|
| blipFill (§21.3.2.2); blipFill (§20.1.8.14); blipFill (§20.2.2.1); blipFill (§20.5.2.2); blipFill (§19.3.1.4) |

| Attributes | Description |
|------------------------|--|
| align (Alignment) | <p>Specifies where to align the first tile with respect to the shape. Alignment happens after the scaling, but before the additional offset.</p> <p>The possible values for this attribute are defined by the ST_RectAlignment simple type (§20.1.10.52).</p> |
| flip (Tile Flipping) | <p>Specifies the direction(s) in which to flip the source image while tiling. Images can be flipped horizontally, vertically, or in both directions to fill the entire region.</p> <p>The possible values for this attribute are defined by the ST_TileFlipMode simple type (§20.1.10.85).</p> |
| sx (Horizontal Ratio) | <p>Specifies the amount to horizontally scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |
| sy (Vertical Ratio) | <p>Specifies the amount to vertically scale the srcRect.</p> <p>The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40).</p> |
| tx (Horizontal Offset) | <p>Specifies additional horizontal offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |
| ty (Vertical Offset) | <p>Specifies additional vertical offset after alignment.</p> <p>The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16).</p> |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_TileInfoProperties](#)) is located in §A.4.1. *end note*]

20.1.8.59 `tileRect` (Tile Rectangle)

This element specifies a rectangular region of the shape to which the gradient is applied. This region is then tiled across the remaining area of the shape to complete the fill. The tile rectangle is defined by percentage offsets from the sides of the shape's bounding box.

Each edge of the tile rectangle is defined by a percentage offset from the corresponding edge of the bounding box. A positive percentage specifies an inset, while a negative percentage specifies an outset. [*Note*: For example, a left offset of 25% specifies that the left edge of the tile rectangle is located to the right of the bounding box's left edge by an amount equal to 25% of the bounding box's width. *end note*]

[*Example*:

The image above depicts a horizontal gradient with no `tileRect` element.

The image above depicts the same gradient with a `tileRect` element specifying `l="50000"` (50%). The right half of the shape is the tile to which the gradient is applied, and the left half of the shape contains a tiled copy of that gradient fill.

The image above depicts the same gradient with a `tileRect` element specifying `l="75000"` (75%). The rightmost 25% of the shape contains the tile rectangle to which the gradient is applied. This gradient is tiled three times to cover the leftmost 75% of the shape. The tile rectangle is flipped horizontally when covering the shape.

end example]

| Parent Elements |
|-----------------------|
| gradFill (§20.1.8.33) |

| Attributes | Description |
|-------------------|---|
| b (Bottom Offset) | Specifies the bottom edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| l (Left Offset) | Specifies the left edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| r (Right Offset) | Specifies the right edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| t (Top Offset) | Specifies the top edge of the rectangle. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |

[Note: The W3C XML Schema definition of this element's content model ([CT_RelativeRect](#)) is located in §A.4.1.
end note]

20.1.8.60 tint (Tint Effect)

This element specifies a tint effect. Shifts effect color values towards/away from hue by the specified amount.

| Parent Elements |
|--|
| blip (§20.1.8.13); cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|--------------|--|
| amt (Amount) | Specifies by how much the color value is shifted. The possible values for this attribute are defined by the ST_FixedPercentage simple type (§20.1.10.24). |
| hue (Hue) | Specifies the hue towards which to tint. The possible values for this attribute are defined by the ST_PositiveFixedAngle simple type (§20.1.10.43). |

[Note: The W3C XML Schema definition of this element's content model ([CT_TintEffect](#)) is located in §A.4.1. *end note*]

20.1.8.61 xfrm (Transform Effect)

This element specifies a transform effect. The transform is applied to each point in the shape's geometry using the following matrix:

$$\begin{bmatrix} sx & \tan(kx) & tx \\ \tan(ky) & sy & ty \\ 0 & 0 & 1 \end{bmatrix} \cdot \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

| Parent Elements |
|---|
| cont (§20.1.8.20); effectDag (§20.1.8.25) |

| Attributes | Description |
|-----------------------|--|
| kx (Horizontal Skew) | Specifies the horizontal skew angle, defined as the angle between the top-left corner and bottom-left corner of the object's original bounding box. If positive, the bottom edge of the shape is positioned to the right relative to the top edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| ky (Vertical Skew) | Specifies the vertical skew angle, defined as the angle between the top-left corner and top-right corner of the object's original bounding box. If positive, the right edge of the object is positioned lower relative to the left edge. The possible values for this attribute are defined by the ST_FixedAngle simple type (§20.1.10.23). |
| sx (Horizontal Ratio) | Specifies a percentage by which to horizontally scale the object. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| sy (Vertical Ratio) | Specifies a percentage by which to vertically scale the object. The possible values for this attribute are defined by the ST_Percentage simple type (§20.1.10.40). |
| tx (Horizontal Shift) | Specifies an amount by which to shift the object along the x-axis. The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |
| ty (Vertical Shift) | Specifies an amount by which to shift the object along the y-axis. |

| Attributes | Description |
|------------|--|
| | The possible values for this attribute are defined by the ST_Coordinate simple type (§20.1.10.16). |

[Note: The W3C XML Schema definition of this element’s content model ([CT_TransformEffect](#)) is located in §A.4.1. end note]

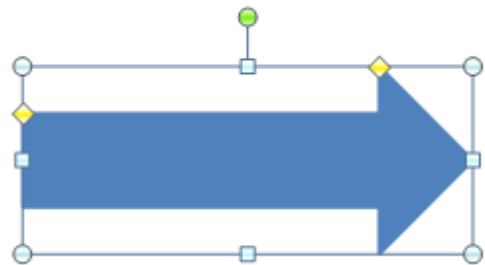

20.1.9 Shape Definitions and Attributes

The Shape Definitions and Attributes portion of the DrawingML framework deals with all geometric properties for shapes within a document. This includes both preset geometries that publicly are interpreted by the generating application and custom geometries that have their points and curves explicitly specified. In addition to the underlying geometry of the shape there are also other coordinate-based properties for each shape that this framework describes.

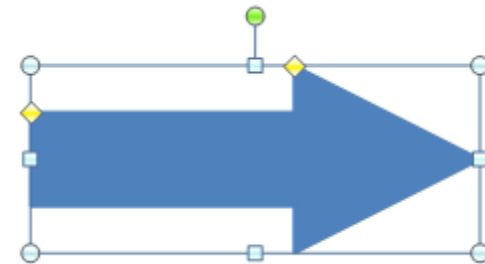

20.1.9.1 ahLst (List of Shape Adjust Handles)

This element specifies the adjust handles that are applied to a custom geometry. These adjust handles specify points within the geometric shape that can be used to perform certain transform operations on the shape.

[Example: Consider the scenario where a custom geometry, an arrow in this case, has been drawn and adjust handles have been placed at the top left corner of both the arrow head and arrow body. The user interface can then be made to transform only certain parts of the shape by using the corresponding adjust handle.

For instance if the user wished to change only the width of the arrow head then they would use the adjust handle located on the top left of the arrow head. The result of adjusting this transforms the shape as shown below.

end example]

| Parent Elements |
|----------------------|
| custGeom (§20.1.9.8) |

| Child Elements | Subclause |
|-------------------------------|-----------|
| ahPolar (Polar Adjust Handle) | §20.1.9.2 |
| ahXY (XY Adjust Handle) | §20.1.9.3 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_AdjustHandleList](#)) is located in §A.4.1. *end note*]

20.1.9.2 ahPolar (Polar Adjust Handle)

This element specifies a polar adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

| Parent Elements |
|-------------------|
| ahLst (§20.1.9.1) |

| Child Elements | Subclause |
|---------------------------------|------------|
| pos (Shape Position Coordinate) | §20.1.9.17 |

| Attributes | Description |
|-----------------------------------|---|
| gdRefAng (Angle Adjustment Guide) | Specifies the name of the guide that is updated with the adjustment angle from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28). |
| gdRefR (Radial Adjustment Guide) | Specifies the name of the guide that is updated with the adjustment radius from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28). |
| maxAng (Maximum Angle Adjustment) | Specifies the maximum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal. |

| Attributes | Description |
|-----------------------------------|---|
| | The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1). |
| maxR (Maximum Radial Adjustment) | Specifies the maximum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |
| minAng (Minimum Angle Adjustment) | Specifies the minimum angle position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move angularly. That is the maxAng and minAng are equal. The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1). |
| minR (Minimum Radial Adjustment) | Specifies the minimum radial position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move radially. That is the maxR and minR are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |

[Note: The W3C XML Schema definition of this element's content model ([CT_PolarAdjustHandle](#)) is located in §A.4.1. *end note*]

20.1.9.3 ahXY (XY Adjust Handle)

This element specifies an XY-based adjust handle for a custom shape. The position of this adjust handle is specified by the corresponding pos child element. The allowed adjustment of this adjust handle are specified via it's min and max type attributes. Based on the adjustment of this adjust handle certain corresponding guides are updated to contain these values.

| Parent Elements |
|-------------------|
| ahLst (§20.1.9.1) |

| Child Elements | Subclause |
|---------------------------------|------------|
| pos (Shape Position Coordinate) | §20.1.9.17 |

| Attributes | Description |
|--------------------------------------|---|
| gdRefX (Horizontal Adjustment Guide) | Specifies the name of the guide that is updated with the adjustment x position from this adjust handle. |

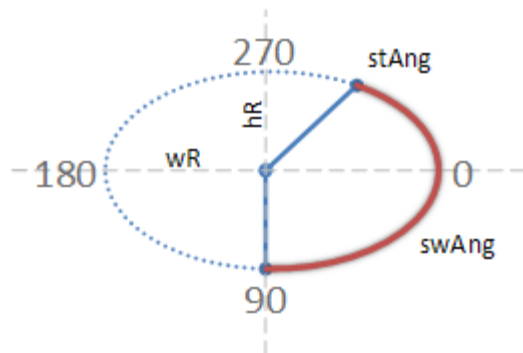

| Attributes | Description |
|--------------------------------------|---|
| | The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28). |
| gdRefY (Vertical Adjustment Guide) | Specifies the name of the guide that is updated with the adjustment y position from this adjust handle. The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28). |
| maxX (Maximum Horizontal Adjustment) | Specifies the maximum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |
| maxY (Maximum Vertical Adjustment) | Specifies the maximum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |
| minX (Minimum Horizontal Adjustment) | Specifies the minimum horizontal position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the x direction. That is the maxX and minX are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |
| minY (Minimum Vertical Adjustment) | Specifies the minimum vertical position that is allowed for this adjustment handle. If this attribute is omitted, then it is assumed that this adjust handle cannot move in the y direction. That is the maxY and minY are equal. The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2). |

[Note: The W3C XML Schema definition of this element's content model ([CT_XYAdjustHandle](#)) is located in §A.4.1. *end note*]

20.1.9.4 [arcTo \(Draw Arc To\)](#)

This element specifies the existence of an arc within a shape path. It draws an arc with the specified parameters from the current pen position to the new point specified. An arc is a line that is bent based on the shape of a supposed circle. The length of this arc is determined by specifying both a start angle and an ending angle that act together to effectively specify an end point for the arc.

[Example: The diagram shown below represents a single arc that has a start angle of 300 degrees and a swing angle of 150 degrees. This arc is drawn using the supposed circle that is described using the hR and wR attributes as shown below. The degrees by which the stAng must abide is shown along the circumference of the circle. These degrees are to be specified in 60,000ths of a degree. If this arc were part of a shape the start angle point along the circle would be the starting point along the path and the ending point would be the ending of the angle swing along this supposed circle. That is any shape geometry coming before this arc in the shape path would be joined with the upper point of this arc and consequently any geometry coming after this arc in the path would be joined with the lower point of this arc.

end example]

| Parent Elements | |
|-------------------|--|
| path (§20.1.9.15) | |

| Attributes | Description |
|-------------------------------|--|
| hR (Shape Arc Height Radius) | <p>This attribute specifies the height radius of the supposed circle being used to draw the arc. This gives the circle a total height of (2 * hR). This total height could also be called it's vertical diameter as it is the diameter for the y axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p> |
| stAng (Shape Arc Start Angle) | <p>Specifies the start angle for an arc. This angle specifies what angle along the supposed circle path is used as the start position for drawing the arc. This start angle is locked to the last known pen position in the shape path. Thus guaranteeing a continuos shape path.</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p> |
| swAng (Shape Arc Swing Angle) | <p>Specifies the swing angle for an arc. This angle specifies how far angle-wise along the supposed cicle path the arc is extended. The extension from the start angle is always in the clockwise direction around the supposed circle.</p> |

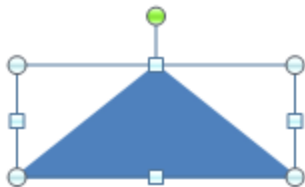

| Attributes | Description |
|-----------------------------|---|
| | The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1). |
| wR (Shape Arc Width Radius) | <p>This attribute specifies the width radius of the supposed circle being used to draw the arc. This gives the circle a total width of $(2 * wR)$. This total width could also be called it's horizontal diameter as it is the diameter for the x axis only.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2DArcTo](#)) is located in §A.4.1. end note]

20.1.9.5 avLst (List of Shape Adjust Values)

This element specifies the adjust values that are applied to the specified shape. An adjust value is simply a guide that has a value based formula specified. That is, no calculation takes place for an adjust value guide. Instead, this guide specifies a parameter value that is used for calculations within the shape guides.

[Example: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an adjust value. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the height, namely 2. Thus we see in the figure below that the bottom of the triangle matches the bottom of the shape bounding box.

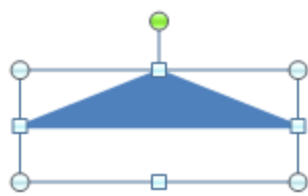

```

<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst>
    <a:gd name="myGuide" fmla="val 2"/>
  </a:avLst>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>

```

```
<a:pathLst>
  <a:path w="2" h="2">
    <a:moveTo>
      <a:pt x="0" y="myGuide"/>
    </a:moveTo>
    <a:lnTo>
      <a:pt x="2" y="myGuide"/>
    </a:lnTo>
    <a:lnTo>
      <a:pt x="1" y="0"/>
    </a:lnTo>
    <a:close/>
  </a:path>
</a:pathLst>
</a:custGeom>
```

If however we change the adjust value to half that, namely 1. Then we see the entire bottom edge of the triangle move to now be placed along the vertical midpoint within the shape bounding box. This is because both of the bottom points in this triangle depend on this adjust value for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.

```
<a:avLst>
  <a:gd name="myGuide" fmla="val 1"/>
</a:avLst>
```

end example]

| Parent Elements |
|--|
| custGeom (§20.1.9.8); prstGeom (§20.1.9.18); prstTxWarp (§20.1.9.19) |

| Child Elements | Subclause |
|------------------|------------|
| gd (Shape Guide) | §20.1.9.11 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_GeomGuideList](#)) is located in §A.4.1. *end note*]

20.1.9.6 close (Close Shape Path)

This element specifies the ending of a series of lines and curves in the creation path of a custom geometric shape. When this element is encountered, the generating application should consider the corresponding path closed. That is, any further lines or curves that follow this element should be ignored.

[*Note*: A path can be specified and not closed. A path such as this cannot however have any fill associated with it as it has not been considered a closed geometric path. *end note*]

[*Example*: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

[*Note*: When the last point in the creation path does not meet with the first point in the creation path the generating application should connect the last point with the first via a straight line, thus creating a closed shape geometry. *end note*]

| Parent Elements |
|-------------------|
| path (§20.1.9.15) |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Path2DClose](#)) is located in §A.4.1. *end note*]

20.1.9.7 **cubicBezTo (Draw Cubic Bezier Curve To)**

This element specifies to draw a cubic bezier curve along the specified points. To specify a cubic bezier curve there needs to be 3 points specified. The first two are control points used in the cubic bezier calculation and the last is the ending point for the curve. The coordinate system used for this kind of curve is the path coordinate system as this element is path specific.

| Parent Elements |
|-------------------|
| path (§20.1.9.15) |

| Child Elements | Subclause |
|-----------------------|------------|
| pt (Shape Path Point) | §20.1.9.20 |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_Path2DCubicBezierTo](#)) is located in §A.4.1. *end note*]

20.1.9.8 **custGeom (Custom Geometry)**

This element specifies the existence of a custom geometric shape. This shape consists of a series of lines and curves described within a creation path. In addition to this there can also be adjust values, guides, adjust handles, connection sites and an inscribed rectangle specified for this custom geometric shape.

[*Example:* Consider the scenario when a preset geometry does not accurately depict what must be displayed in the document. For this a custom geometry can be used to define most any 2-dimensional geometric shape. Shown below is an example of such a custom geometry.

```
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst/>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2650602" h="1261641">
      <a:moveTo>
        <a:pt x="0" y="1261641"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2650602" y="1261641"/>
      </a:lnTo>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

```

<a:lnTo>
  <a:pt x="1226916" y="0"/>
</a:lnTo>
<a:close/>
</a:path>
</a:pathLst>
</a:custGeom>

```

The custom geometry above is drawn by first moving to a specific starting point with the `moveTo` element. Then a series of `lnTo` elements in the creation path specify the lines that make up the borders of the shape and finally a `close` element is used to specify the end of the creation path. The resulting shape is shown above. *end example]*

| pathLst (List of Shape Paths) | §20.1.9.16 |
| rect (Shape Text Rectangle) | §20.1.9.22 |

[*Note:* The W3C XML Schema definition of this element's content model ([CT_CustomGeometry2D](#)) is located in §A.4.1. *end note*]

20.1.9.9 cxn (Shape Connection Site)

This element specifies the existence of a connection site on a custom shape. A connection site allows a `cxnSp` to be attached to this shape. This connection is maintained when the shape is repositioned within the document. It should be noted that this connection is placed within the shape bounding box using the transform coordinate

system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Note:* The transform coordinate system is different from a path coordinate system as it is per shape instead of per path within the shape. *end note*]

[*Example:* Consider the following custom geometry that has two connection sites specified. One connection is located at the bottom left of the shape and the other at the bottom right. The following DrawingML would describe such a custom geometry.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst/>
  <a:ahLst/>
  <a:cxnLst>
    <a:cxn ang="0">
      <a:pos x="0" y="679622"/>
    </a:cxn>
    <a:cxn ang="0">
      <a:pos x="1705233" y="679622"/>
    </a:cxn>
  </a:cxnLst>
  <a:rect l="0" t="0" r="0" b="0"/>
  <a:pathLst>
    <a:path w="2" h="2">
      <a:moveTo>
        <a:pt x="0" y="2"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="2" y="2"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1" y="0"/>
      </a:lnTo>
    </a:path>
  </a:pathLst>
</a:custGeom>
```

```

    <a:close/>
  </a:path>
</a:pathLst>
</a:custGeom>

```

end example]

| Parent Elements |
|---------------------|
| cxnLst (§20.1.9.10) |

| Child Elements | Subclause |
|---------------------------------|------------|
| pos (Shape Position Coordinate) | §20.1.9.17 |

| Attributes | Description |
|-----------------------------|---|
| ang (Connection Site Angle) | <p>Specifies the incoming connector angle. This angle is the angle around the connection site that an incoming connector tries to be routed to. This allows connectors to know where the shape is in relation to the connection site and route connectors so as to avoid any overlap with the shape.</p> <p>[Example: Consider a simple square. In order to not have any connectors routed over the shape, the following angles would be specified for their respective connection sites.</p> <div data-bbox="435 1087 678 1312"></div> <p>end example]</p> <p>The possible values for this attribute are defined by the ST_AdjAngle simple type (§20.1.10.1).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_ConnectionSite](#)) is located in §A.4.1. end note]

20.1.9.10 cxnLst (List of Shape Connection Sites)

This element specifies all the connection sites that are used for this shape. A connection site is specified by defining a point within the shape bounding box that can have a cxnSp element attached to it. These connection sites are specified using the shape coordinate system that is specified within the ext transform element.

| Parent Elements |
|----------------------|
| custGeom (§20.1.9.8) |

| Child Elements | Subclause |
|-----------------------------|-----------|
| cxn (Shape Connection Site) | §20.1.9.9 |

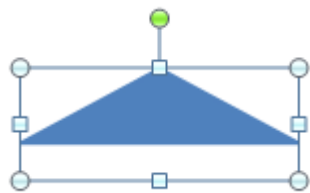

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_ConnectionSiteList](#)) is located in §A.4.1. *end note*]

20.1.9.11 gd (Shape Guide)

This element specifies the presence of a shape guide that is used to govern the geometry of the specified shape. A shape guide consists of a formula and a name that the result of the formula is assigned to. Recognized formulas are listed with the `fmla` attribute documentation for this element.

[*Note*: The order in which guides are specified determines the order in which their values are calculated. For instance it is not possible to specify a guide that uses another guides result when that guide has not yet been calculated. *end note*]

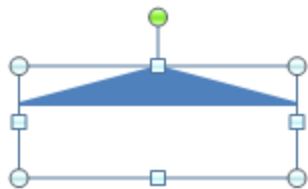

[*Example*: Consider the case where the user would like to specify a triangle with it's bottom edge defined not by static points but by using a varying parameter, namely an guide. Consider the diagrams and DrawingML shown below. This first triangle has been drawn with a bottom edge that is equal to the 2/3 the value of the shape height. Thus we see in the figure below that the triangle appears to occupy 2/3 of the vertical space within the shape bounding box.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>
<a:custGeom>
  <a:avLst/>
  <a:gdLst>
    <a:gd name="myGuide" fmla="*/ h 2 3"/>
  </a:gdLst>
```

```
<a:ahLst/>
<a:cxnLst/>
<a:rect l="0" t="0" r="0" b="0"/>
<a:pathLst>
  <a:path w="1705233" h="679622">
    <a:moveTo>
      <a:pt x="0" y="myGuide"/>
    </a:moveTo>
    <a:lnTo>
      <a:pt x="1705233" y="myGuide"/>
    </a:lnTo>
    <a:lnTo>
      <a:pt x="852616" y="0"/>
    </a:lnTo>
    <a:close/>
  </a:path>
</a:pathLst>
</a:custGeom>
```

If however we change the guide to half that, namely 1/3. Then we see the entire bottom edge of the triangle move to now only occupy 1/3 of the total space within the shape bounding box. This is because both of the bottom points in this triangle depend on this guide for their coordinate positions. The triangle and corresponding DrawingML shown below illustrate this point.

```
<a:gdLst>
  <a:gd name="myGuide" fmla="*/ h 1 3"/>
</a:gdLst>
```

end example]

| Parent Elements |
|---------------------------------------|
| avLst (§20.1.9.5); gdLst (§20.1.9.12) |

| Attributes | Description |
|----------------------------|--|
| fmla (Shape Guide Formula) | Specifies the formula that is used to calculate the value for a guide. Each formula has a certain number of arguments and a specific set of operations to perform on these |

| Attributes | Description |
|------------|--|
| | <p>arguments in order to generate a value for a guide. There are a total of 17 different formulas available. These are shown below with the usage for each defined.</p> <p>('*/') - Multiply Divide Formula Arguments: 3 (fmla="*/ x y z") Usage: "*/ x y z" = $((x * y) / z)$ = value of this guide</p> <p>('+-') - Add Subtract Formula Arguments: 3 (fmla="+- x y z") Usage: "+- x y z" = $((x + y) - z)$ = value of this guide</p> <p>('+/') - Add Divide Formula Arguments: 3 (fmla="+/ x y z") Usage: "+/ x y z" = $((x + y) / z)$ = value of this guide</p> <p>('?:') - If Else Formula Arguments: 3 (fmla="?: x y z") Usage: "?: x y z" = if $(x > 0)$, then y = value of this guide, else z = value of this guide</p> <p>('abs') - Absolute Value Formula Arguments: 1 (fmla="abs x") Usage: "abs x" = if $(x < 0)$, then $(-1) * x$ = value of this guide else x = value of this guide</p> <p>('at2') - ArcTan Formula Arguments: 2 (fmla="at2 x y") Usage: "at2 x y" = $\arctan(y / x)$ = value of this guide</p> <p>('cat2') - Cosine ArcTan Formula Arguments: 3 (fmla="cat2 x y z") Usage: "cat2 x y z" = $(x * (\cos(\arctan(z / y))))$ = value of this guide</p> <p>('cos') - Cosine Formula Arguments: 2 (fmla="cos x y") Usage: "cos x y" = $(x * \cos(y))$ = value of this guide</p> <p>('max') - Maximum Value Formula Arguments: 2 (fmla="max x y") Usage: "max x y" = if $(x > y)$, then x = value of this guide else y = value of this guide</p> <p>('min') - Minimum Value Formula Arguments: 2 (fmla="min x y") Usage: "min x y" = if $(x < y)$, then x = value of this guide else y = value of this guide</p> <p>('mod') - Modulo Formula Arguments: 3 (fmla="mod x y z") Usage: "mod x y z" = $\sqrt{x^2 + b^2 + c^2}$ = value of this guide</p> <p>('pin') - Pin To Formula Arguments: 3 (fmla="pin x y z")</p> |

| Attributes | Description |
|-------------------------|---|
| | <p>Usage: "pin x y z" = if (y < x), then x = value of this guide else if (y > z), then z = value of this guide else y = value of this guide</p> <p>('sat2') - Sine ArcTan Formula Arguments: 3 (fmla="sat2 x y z") Usage: "sat2 x y z" = (x*sin(arctan(z / y))) = value of this guide</p> <p>('sin') - Sine Formula Arguments: 2 (fmla="sin x y") Usage: "sin x y" = (x * sin(y)) = value of this guide</p> <p>('sqrt') - Square Root Formula Arguments: 1 (fmla="sqrt x") Usage: "sqrt x" = sqrt(x) = value of this guide</p> <p>('tan') - Tangent Formula Arguments: 2 (fmla="tan x y") Usage: "tan x y" = (x * tan(y)) = value of this guide</p> <p>('val') - Literal Value Formula Arguments: 1 (fmla="val x") Usage: "val x" = x = value of this guide</p> <p>[Note: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. <i>end note</i>]</p> <p>The possible values for this attribute are defined by the ST_GeomGuideFormula simple type (§20.1.10.27).</p> |
| name (Shape Guide Name) | <p>Specifies the name that is used to reference to this guide. This name can be used just as a variable would within an equation. That is this name can be substituted for literal values within other guides or the specification of the shape path.</p> <p>The possible values for this attribute are defined by the ST_GeomGuideName simple type (§20.1.10.28).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_GeomGuide](#)) is located in §A.4.1. *end note*]

20.1.9.12 [gdLst \(List of Shape Guides\)](#)

This element specifies all the guides that are used for this shape. A guide is specified by the gd element and defines a calculated value that can be used for the construction of the corresponding shape.

[Note: Guides that have a literal value formula specified via fmla="val x" above should only be used within the avLst as an adjust value for the shape. This however is not strictly enforced. *end note*]

| Parent Elements |
|----------------------|
| custGeom (§20.1.9.8) |

| Child Elements | Subclause |
|------------------|------------|
| gd (Shape Guide) | §20.1.9.11 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_GeomGuideList](#)) is located in §A.4.1. *end note*]

20.1.9.13 [lnTo \(Draw Line To\)](#)

This element specifies the drawing of a straight line from the current pen position to the new point specified. This line becomes part of the shape geometry, representing a side of the shape. The coordinate system used when specifying this line is the path coordinate system.

| Parent Elements |
|-------------------|
| path (§20.1.9.15) |

| Child Elements | Subclause |
|-----------------------|------------|
| pt (Shape Path Point) | §20.1.9.20 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Path2DLineTo](#)) is located in §A.4.1. *end note*]

20.1.9.14 [moveTo \(Move Path To\)](#)

This element specifies a set of new coordinates to move the shape cursor to. This element is only used for drawing a custom geometry. When this element is utilized the pt element is used to specify a new set of shape coordinates that the shape cursor should be moved to. This does not draw a line or curve to this new position from the old position but simply move the cursor to a new starting position. It is only when a path drawing element such as lnTo is used that a portion of the path is drawn.

[*Example*: Consider the case where a user wishes to begin drawing a custom geometry not at the default starting coordinates of $x=0$, $y=0$ but at coordinates further inset into the shape coordinate space. The following DrawingML would specify such a case.

```

<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>

```

Notice the moveTo element advances the y coordinates before any actual lines are drawn. *end example*]

| Parent Elements |
|-------------------|
| path (§20.1.9.15) |

| Child Elements | Subclause |
|-----------------------|------------|
| pt (Shape Path Point) | §20.1.9.20 |

[*Note*: The W3C XML Schema definition of this element's content model ([CT_Path2DMoveTo](#)) is located in §A.4.1. *end note*]

20.1.9.15 path (Shape Path)

This element specifies a creation path consisting of a series of moves, lines and curves that when combined forms a geometric shape. This element is only utilized if a custom geometry is specified.

[*Note*: Since multiple paths are allowed the rules for drawing are that the path specified later in the pathLst is drawn on top of all previous paths. *end note*]

[*Example*: Consider the following DrawingML.

```

<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
      <a:lnTo>
        <a:pt x="1620455" y="590309"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="2824222" y="173620"/>
      </a:lnTo>
      <a:lnTo>
        <a:pt x="1562582" y="0"/>
      </a:lnTo>
      <a:close/>
    </a:path>
  </a:pathLst>
</a:custGeom>

```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the lnTo element there are actually four sides because the last point of (x=1562585, y=0) is connected to the first point in the creation path via a lnTo element. *end example*]

| Parent Elements |

| moveTo (Move Path To) | §20.1.9.14 |
| quadBezTo (Draw Quadratic Bezier Curve To) | §20.1.9.21 |

| Attributes | Description |
|------------------------------------|---|
| extrusionOk (3D Extrusion Allowed) | Specifies that the use of 3D extrusions are possible on this path. This allows the generating application to know whether 3D extrusion can be applied in any form. If this attribute is omitted then a value of 0, or false is assumed. |

| Attributes | Description |
|----------------------|--|
| | The possible values for this attribute are defined by the W3C XML Schema boolean datatype. |
| fill (Path Fill) | <p>Specifies how the corresponding path should be filled. If this attribute is omitted, a value of "norm" is assumed.</p> <p>The possible values for this attribute are defined by the ST_PathFillMode simple type (§20.1.10.37).</p> |
| h (Path Height) | <p>Specifies the height, or maximum y coordinate that should be used for within the path coordinate system. This value determines the vertical placement of all points within the corresponding path as they are all calculated using this height attribute as the max y coordinate.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |
| stroke (Path Stroke) | <p>Specifies if the corresponding path should have a path stroke shown. This is a boolean value that affect the outline of the path. If this attribute is omitted, a value of true is assumed.</p> <p>The possible values for this attribute are defined by the W3C XML Schema boolean datatype.</p> |
| w (Path Width) | <p>Specifies the width, or maximum x coordinate that should be used for within the path coordinate system. This value determines the horizontal placement of all points within the corresponding path as they are all calculated using this width attribute as the max x coordinate.</p> <p>The possible values for this attribute are defined by the ST_PositiveCoordinate simple type (§20.1.10.41).</p> |

[Note: The W3C XML Schema definition of this element's content model ([CT_Path2D](#)) is located in §A.4.1. *end note*]

20.1.9.16 pathLst (List of Shape Paths)

This element specifies the entire path that is to make up a single geometric shape. The pathLst can consist of many individual paths within it.

[Example: Consider the following DrawingML.

```
<a:custGeom>
  <a:pathLst>
    <a:path w="2824222" h="590309">
      <a:moveTo>
        <a:pt x="0" y="428263"/>
      </a:moveTo>
```

```
<a:lnTo>
  <a:pt x="1620455" y="590309"/>
</a:lnTo>
<a:lnTo>
  <a:pt x="2824222" y="173620"/>
</a:lnTo>
<a:lnTo>
  <a:pt x="1562582" y="0"/>
</a:lnTo>
<a:close/>
</a:path>
</a:pathLst>
</a:custGeom>
```

In the above example there is specified a four sided geometric shape that has all straight sides. While we only see three lines being drawn via the `lnTo` element there are actually four sides because the last point of (`x=1562585`, `y=0`) is connected to the first point in the creation path via a `lnTo` element. *end example*

[*Note*: A geometry with multiple paths within it should be treated visually as if each path were a distinct shape. That is each creation path has its first point and last point joined to form a closed shape. However, the generating application should then connect the last point to the first point of the new shape. If a `close` element is encountered at the end of the previous creation path then this joining line should not be rendered by the generating application. The rendering should resume with the first line or curve on the new creation path. *end note*]

[*Note*: The W3C XML Schema definition of this element’s content model ([CT_Path2DList](#)) is located in §A.4.1. *end note*]

20.1.9.17 pos (Shape Position Coordinate)

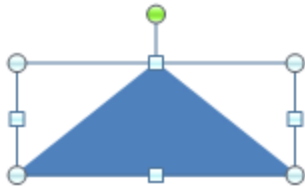

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the `ext transform` element.

[Note: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is $x=0$, $y=0$ and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.

end note]

[Example: To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.

```
<a:xfrm>
  <a:off x="3200400" y="1600200"/>
  <a:ext cx="1705233" cy="679622"/>
</a:xfrm>

| Attributes | Description |
|------------------|---|
| x (X-Coordinate) | <p>Specifies the x coordinate for this position coordinate. The units for this coordinate space are defined by the width of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p> |
| y (Y-Coordinate) | <p>Specifies the y coordinate for this position coordinate. The units for this coordinate space are defined by the height of the path coordinate system. This coordinate system is overlayed on top of the shape coordinate system thus occupying the entire shape bounding box. Because the units for within this coordinate space are determined by the path width and height an exact measurement unit cannot be specified here.</p> <p>The possible values for this attribute are defined by the ST_AdjCoordinate simple type (§20.1.10.2).</p> |

[*Note:* The W3C XML Schema definition of this element’s content model ([CT_AdjPoint2D](#)) is located in §A.4.1.
end note]

20.1.9.18 prstGeom (Preset geometry)

This element specifies when a preset geometric shape should be used instead of a custom geometric shape. The generating application should be able to render all preset geometries enumerated in the ST_ShapeType list.

[*Example:* Consider the scenario when a user does not wish to specify all the lines and curves that make up the desired shape but instead chooses to use a preset geometry. The following DrawingML would specify such a case.

```
<p:sp>
  <p:nvSpPr>
    <p:cNvPr id="4" name="My Preset Shape"/>
    <p:cNvSpPr/>
    <p:nvPr/>
  </p:nvSpPr>
  <p:spPr>
    <a:xfrm>
      <a:off x="1981200" y="533400"/>
      <a:ext cx="1143000" cy="1066800"/>
    </a:xfrm>
    <a:prstGeom prst="heart">
    </a:prstGeom>
  </p:spPr>
</p:sp>
```

The output shape rendered by this DrawingML is shown above. *end example*]

| | <p>values in the enumerated list for ST_ShapeType. This attribute is required in order for a preset geometry to be rendered.</p> <p>[Example: Consider the sample DrawingML below.</p> <pre><p:sp> <p:nvSpPr> <p:cNvPr id="4" name="Sun 3"/> <p:cNvSpPr/> <p:nvPr/> </p:nvSpPr> <p:spPr> <a:xfrm> <a:off x="1981200" y="533400"/> <a:ext cx="1143000" cy="1066800"/> </a:xfrm> <a:prstGeom prst="sun"> </a:prstGeom> </p:spPr> </p:sp></pre> <p>In the above example a preset geometry has been used to define a shape. The shape utilized here is the sun shape. <i>end example</i>]</p> <p>The possible values for this attribute are defined by the ST_ShapeType simple type (§20.1.10.55).</p> |

[Note: The W3C XML Schema definition of this element’s content model ([CT_PresetGeometry2D](#)) is located in §A.4.1. *end note*]

20.1.9.19 prstTxWarp (Preset Text Warp)

This element specifies when a preset geometric shape should be used to transform a piece of text. This operation is known formally as a text warp. The generating application should be able to render all preset geometries enumerated in the ST_TextShapeType list.

[Example: Consider the case where the user wishes to accent a piece of text by warping it's shape. For this to occur a preset shape is chosen from the ST_TextShapeType list and applied to the entire body of text.

```

<p:sp>
  <p:txBody>
    <a:bodyPr wrap="none" rtlCol="0">
      <a:prstTxWarp prst="textInflate">
        </a:prstTxWarp>
        <a:spAutoFit/>
      </a:bodyPr>
      <a:lstStyle/>
    </a:p>
  ...
    <a:t>Sample Text</a:t>
  ...
</a:p>
</p:txBody>
</p:sp>

```

No Warp: Sample Text

Inflate Warp: Sample Text

The resulting text that has now had the Inflate text warp applied to it is shown above. *end example]*

Using any of the presets listed under the ST_TextShapeType list below it is possible to apply a text warp to a run of DrawingML text via the following steps.

If you look at any of the text warps in the file format you notice that each consists of two paths. This corresponds to a top path (first one specified) and a bottom path (second one specified). Now the top path and the bottom path represent the top line and base line that the text needs to be warped to. This is done in the following way:

1. Compute the rectangle that the unwrapped text resides in. (tightest possible rectangle around text, no white space except for "space characters")
2. Take each of the quadratic and cubic Bezier curves that are used to calculate the original character and change their end points and control points by the following method...
3. Move a vertical line horizontally along the original text rectangle and find the horizontal percentage that a given end point or control point lives at. (.5 for the middle for instance)
4. Now do the same thing for this point vertically. Find the vertical percentage that this point lives at with the top and bottom of this text rectangle being the respective top and bottom bounds. (0.0 and 1.0 respectively)
5. Now that we have the percentages for a given point in a Bezier equation we can map that to the new point in the warped text environment.

6. Going back to the top and bottom paths specified in the file format we can take these and flatten them out to a straight arc (top and bottom might be different lengths)
7. After they are straight we can measure them both horizontally to find the same percentage point that we found within the original text rectangle. (0.5 let's say)
8. So then we measure 50% along the top path and 50% along the bottom path, putting the paths back to their original curvy shapes.
9. Once we have these two points we can draw a line between them that serves as our vertical line in the original text rectangle [*Note: This might not be truly vertical as 50% on the top does not always line up with 50% on the bottom. end note*]
10. Taking this new line we then follow it from top to bottom the vertical percentage amount that we got from step 4.
11. This is then the new point that should be used in place of the old point in the original text rectangle.
12. We then continue doing these same steps for each of the end points and control points within the body of text. (is applied to a whole body of text only)

[*Note: Horizontal percentages begin at 0.0 and continue to 1.0, left to right. Vertical percentages begin at 0.0 and continue to 1.0, top to bottom. end note*]

[*Note: Since this is a shape it does have both a shape coordinate system and a path coordinate system. end note*]

20.1.9.20 pt (Shape Path Point)

This element specifies an x-y coordinate within the path coordinate space. This coordinate space is determined by the width and height attributes defined within the path element. A point is utilized by one of it's parent elements to specify the next point of interest in custom geometry shape. Depending on the parent element used the point can either have a line drawn to it or the cursor can simply be moved to this new location.

[Note: When specifying a point coordinate in path coordinate space it should be noted that the top left of the coordinate space is x=0, y=0 and the coordinate points for x grow to the right and for y grow down. This is illustrated in the diagram below.

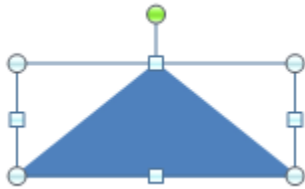

end note]

Specifies a position coordinate within the shape bounding box. It should be noted that this coordinate is placed within the shape bounding box using the transform coordinate system which is also called the shape coordinate

system, as it encompasses the entire shape. The width and height for this coordinate system are specified within the ext transform element.

[*Example:* To highlight the differences in the coordinate systems consider the drawing of the following triangle. Notice that the dimensions of the triangle are specified using the shape coordinate system with EMUs as the units via the ext transform element. Thus we see this shape is 1705233 EMUs wide by 679622 EMUs tall. However when looking at how the path for this shape is drawn we see that the x and y values fall between 0 and 2. This is because the path coordinate system has the arbitrary dimensions of 2 for the width and 2 for the height. Thus we see that a y coordinate of 2 within the path coordinate system specifies a y coordinate of 679622 within the shape coordinate system for this particular case.

```

<a:xfrm>

20.1.10 Simple Types

This is the complete list of simple types dedicated to DrawingML framework.

20.1.10.1 ST_AdjAngle (Adjustable Angle Methods)

This simple type is an adjustable angle, either an absolute angle or a reference to a geometry guide. The units for an adjustable angle are 60,000ths of a degree.

This simple type is a union of the following types:

- The ST_Angle simple type (§20.1.10.3).
- The ST_GeomGuideName simple type (§20.1.10.28).

| Referenced By |
|---|
| ahPolar@maxAng (§20.1.9.2); ahPolar@minAng (§20.1.9.2); arcTo@stAng (§20.1.9.4); arcTo@swAng (§20.1.9.4); cxn@ang (§20.1.9.9) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_AdjAngle](#)) is located in §A.4.1. *end note*]

20.1.10.2 ST_AdjCoordinate (Adjustable Coordinate Methods)

This simple type is an adjustable coordinate is either an absolute coordinate position or a reference to a geometry guide.

This simple type is a union of the following types:

- The ST_Coordinate simple type (§20.1.10.16).
- The ST_GeomGuideName simple type (§20.1.10.28).

| Referenced By |

20.1.10.4 [ST_AnimationBuildType \(Animation Build Type\)](#)

This simple type specifies the ways that an animation can be built, or animated.

This simple type's contents are a restriction of the W3C XML Schema `token` datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-----------------------------|-----------------------------|
| allAtOnce (Animate At Once) | Animate all objects as one. |

| Referenced By |
|--|
| ST_AnimationChartBuildType (§20.1.10.5); ST_AnimationDgmBuildType (§20.1.10.7) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnimationBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.5 [ST_AnimationChartBuildType \(Chart Animation Build Type\)](#)

This simple type specifies the ways that a chart animation can be built. That is, it specifies the way in which the objects within the chart should be animated.

This simple type is a union of the following types:

- The [ST_AnimationBuildType](#) simple type (§20.1.10.4).
- The [ST_AnimationChartOnlyBuildType](#) simple type (§20.1.10.6).

| Referenced By |

| ST_AnimationChartBuildType (§20.1.10.5) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnimationChartOnlyBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.7 ST_AnimationDgmBuildType (Diagram Animation Build Type)

This simple type specifies the ways that a diagram animation can be built. That is, it specifies the way in which the objects within the diagram graphical object should be animated.

This simple type is a union of the following types:

- The ST_AnimationBuildType simple type (§20.1.10.4).
- The ST_AnimationDgmOnlyBuildType simple type (§20.1.10.8).

| Referenced By |
|--------------------------|
| bldDgm@bld (§20.1.2.2.2) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_AnimationDgmBuildType](#)) is located in §A.4.1. *end note*]

20.1.10.8 ST_AnimationDgmOnlyBuildType (Diagram only Animation Types)

This simple type specifies the build options available only for animating a diagram. These options specify the manner in which the objects within the chart should be grouped and animated.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|---|
| lvlAtOnce (Each Level at Once) | Animate the diagram one level at a time, animating the whole level as one object |
| lvlOne (Level One-by-One) | Animate the diagram by the elements within a level, animating them one level element at a time. |
| one (Elements One-by-One) | Animate the diagram by elements. For a tree diagram the animation occurs by branch within the diagram tree. |

| Referenced By |
|---------------------------------------|

20.1.10.10 ST_BlackWhiteMode (Black and White Mode)

This simple type specifies how an object should be rendered when specified to be in black and white mode.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------------|---|
| auto (Automatic) | Object rendered with automatic coloring |
| black (Black) | Object rendered with black-only coloring |
| blackGray (Black and Gray) | Object rendered with black and gray coloring |
| blackWhite (Black and White) | Object rendered within black and white coloring |
| clr (Color) | Object rendered with normal coloring |
| gray (Gray) | Object rendered with gray coloring |
| grayWhite (Gray and White) | Object rendered within gray and white coloring |
| hidden (Hidden) | Object rendered with hidden coloring |
| invGray (Inverse Gray) | Object rendered with inverse gray coloring |
| ltGray (Light Gray) | Object rendered with light gray coloring |
| white (White) | Object rendered within white coloring |

20.1.10.11 ST_BlendMode (Blend Mode)

This simple type describes how to render effects one on top of another.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|-------------|
| darken (Darken) | Darken |
| lighten (Lighten) | Lighten |
| mult (Multiply) | Multiply |
| over (Overlay) | Overlay |
| screen (Screen) | Screen |

20.1.10.12 ST_BlipCompression (Blip Compression Type)

This type specifies the amount of compression that has been used for a particular binary large image or picture (blip).

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| email (Email Compression) | Compression size suitable for inclusion with email |
| hqprint (High Quality Printing Compression) | Compression size suitable for high quality printing |
| none (No Compression) | No compression was used |
| print (Printing Compression) | Compression size suitable for printing |
| screen (Screen Viewing Compression) | Compression size suitable for viewing on screen |

20.1.10.13 ST_ChartBuildStep (Chart Animation Build Step)

This simple type specifies an animation build step within a chart animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|---|
| allPts (All Points) | Animate all points within the chart for this animation build step |
| category (Category) | Animate a chart category for this animation build step |
| gridLegend (Grid and Legend) | Animate the chart grid and legend for this animation build step |
| ptInCategory (Category Points) | Animate a point in a chart category for this animation build step |
| ptInSeries (Series Points) | Animate a point in a chart series for this animation build step |
| series (Series) | Animate a chart series for this animation build step |

| Referenced By |

20.1.10.14 ST_ColorSchemeIndex (Theme Color Reference)

A reference to a color in the color scheme.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------|--|
| accent1 (Accent 1) | Represents the accent 1 color. |
| accent2 (Accent 2) | Represents the accent 2 color. |
| accent3 (Accent 3) | Represents the accent 3 color. |
| accent4 (Accent 4) | Represents the accent 4 color. |
| accent5 (Accent 5) | Represents the accent 5 color. |
| accent6 (Accent 6) | Represents the accent 6 color. |
| dk1 (Dark 1) | Represents the first dark color. |
| dk2 (Dark 2) | Represents the second dark color. |
| folHlink (Followed Hyperlink) | Represents the followed hyperlink color. |
| hlink (Hyperlink) | Represents the hyperlink color. |

| Enumeration Value | Description |
|-------------------|------------------------------------|
| lt1 (Light 1) | Represents the first light color. |
| lt2 (Light 2) | Represents the second light color. |

20.1.10.15 ST_CompoundLine (Compound Line Type)

This simple type specifies the compound line type that is to be used for lines with text such as underlines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|-----------------------------------|
| dbl (Double Lines) | Double lines of equal width |
| sng (Single Line) | Single line: one normal width |
| thickThin (Thick Thin Double Lines) | Double lines: one thick, one thin |
| thinThick (Thin Thick Double Lines) | Double lines: one thin, one thick |
| tri (Thin Thick Thin Triple Lines) | Three lines: thin, thick, thin |

20.1.10.16 ST_Coordinate (Coordinate)

This simple type represents a one dimensional position or length as either:

- EMUs.
- A number followed immediately by a unit identifier.

This simple type is a union of the following types:

- The ST_CoordinateUnqualified simple type (§20.1.10.19).
- The ST_UniversalMeasure simple type (§22.9.2.15).

[Note: The W3C XML Schema definition of this simple type's content model ([ST_Coordinate](#)) is located in §A.4.1. *end note*]

20.1.10.17 ST_Coordinate32 (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing; its maximum size is 2147483647 EMUs.

Its contents can contain either:

- A whole number, whose contents consist of a measurement in EMUs (English Metric Units)
- A number immediately followed by a unit identifier

This simple type is a union of the following types:

- The ST_Coordinate32Unqualified simple type (§20.1.10.18).

- The ST_UniversalMeasure simple type (§22.9.2.15).

20.1.10.18 ST_Coordinate32Unqualified (Coordinate Point)

This simple type specifies a coordinate within the document. This can be used for measurements or spacing with the maximum size requirement being a 32 bit integer.

The units of measurement used here are EMUs (English Metric Units).

This simple type's contents are a restriction of the W3C XML Schema int datatype.

| Referenced By |
|--|
| ST_Coordinate32 (§20.1.10.17); ST_LineWidth (§20.1.10.35); ST_PositiveCoordinate32 (§20.1.10.42); ST_TextIndent (§20.1.10.69); ST_TextMargin (§20.1.10.71) |

20.1.10.19 ST_CoordinateUnqualified (Coordinate)

This simple type represents a one dimensional position or length in EMUs.

This simple type's contents are a restriction of the W3C XML Schema long datatype.

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to -27273042329600.
- This simple type has a maximum value of less than or equal to 27273042316900.

20.1.10.20 ST_DgmBuildStep (Diagram Animation Build Steps)

This simple type specifies an animation build step within a diagram animation.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| bg (Background) | Animate the diagram background for this animation build step |
| sp (Shape) | Animate a diagram shape for this animation build step |

| Referenced By |

20.1.10.22 ST_EffectContainerType (Effect Container Type)

This simple type determines the relationship between effects in a container, either sibling or tree.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|---|
| sib (Sibling) | Each effect is separately applied to the parent object. |

| Enumeration Value | Description |
|-------------------|---|
| | <i>[Example: If the parent element contains an outer shadow and a reflection, the resulting effect is a shadow around the parent object and a reflection of the object. The reflection does not have a shadow. end example]</i> |
| tree (Tree) | Each effect is applied to the result of the previous effect. <i>[Example: If the parent element contains an outer shadow followed by a glow, the shadow is first applied to the parent object. Then, the glow is applied to the shadow (rather than the original object). The resulting effect would be a glowing shadow. end example]</i> |

20.1.10.23 ST_FixedAngle (Fixed Angle)

This simple type represents a fixed range angle in 60000ths of a degree. Range from (-90, 90 degrees).

This simple type's contents are a restriction of the ST_Angle datatype (§20.1.10.3).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than -5400000.
- This simple type has a maximum value of less than 5400000.

20.1.10.25 ST_FontCollectionIndex (Font Collection Index)

This simple type represents one of the fonts associated with the style.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------|--|
| major (Major Font) | The major font of the style's font scheme. |
| minor (Minor Font) | The minor font of the style's font scheme. |
| none (None) | No font reference. |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_GeomGuideName](#)) is located in §A.4.1. *end note*]

20.1.10.29 ST_LightRigDirection (Light Rig Direction)

Represents the direction from which the light rig is positioned relative to the scene. The light rig, itself, can be made up of multiple lights in any orientation around a given shape. This simple type defines the orientation of the light rig as a whole, and not the individual lights within the rig. This means that because the direction of the light rig is left, that does not guarantee the light is coming from the left side of the shape, but rather the orientation of the rig as a whole is rotated to the left.

[*Example:* Consider the following example as a visual representation of a light rig oriented from the top of the shape in the center:

In this example we see that the light rig defines three lights (all in a single plane as represented by the black circular line). The lights defined in this representation can all have different intensities, which means, for this example, Light 3 and Light 2 look to have a more intense effect (or could even be a different color) than Light 1. One can imagine rotating this rig to the so that Light 1 is to the right of the shape when the light rig direction is defined to be right. *end example]*

The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Three Point light rig type
- Circle bevel type
- Plastic material type
- Camera type defined by the orthographicFront preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| b (Bottom) | [Example: Consider the following example of a light direction from the bottom: |

| Enumeration Value | Description |
|-------------------|---|
| |  <i>end example]</i> |
| bl (Bottom Left) | <p>[Example: Consider the following example of a light direction from the bottom left:</p>  <i>end example]</i> |
| br (Bottom Right) | <p>[Example: Consider the following example of a light direction from the bottom right:</p>  <i>end example]</i> |
| l (Left) | <p>[Example: Consider the following example of a light direction from the left:</p> |

| Enumeration Value | Description |
|-------------------|--|
| |  <i>end example]</i> |
| r (Right) | <p>[<i>Example:</i> Consider the following example of a light direction from the right:</p>  <i>end example]</i> |
| t (Top) | <p>[<i>Example:</i> Consider the following example of a light direction from the top:</p>  <i>end example]</i> |

[*Note:* The W3C XML Schema definition of this simple type’s content model ([ST_LightRigDirection](#)) is located in §A.4.1. *end note*]

20.1.10.30 ST_LightRigType (Light Rig Type)

Represents a preset light right that can be applied to a shape. The light rig represents a group of lights oriented in a specific way relative to a 3D scene. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape

- Circle bevel type
- Warm Matte material type
- Camera type defined by the perspectiveContrastingRightFacing preset
- Bevel width and height each equal to 190500

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--|--|
| balanced (Light Rig Enum (Balanced)) | Balanced |
| brightRoom (Bright Room) | <div>[Example: Consider the following example of the brightRoom light rig applied to a basic shape:</div> <div></div> <div>end example]</div> |
| chilly (Chilly) | <div>[Example: Consider the following example of the chilly light rig applied to a basic shape:</div> <div></div> <div>end example]</div> |
| contrasting (Contrasting) | <div>[Example: Consider the following example of the contrasting light rig applied to a basic shape:</div> |

| Enumeration Value | Description |
|---------------------|--|
| |  <i>end example]</i> |
| flat (Flat) | <p>[Example: Consider the following example of the flat light rig applied to a basic shape:</p>  <i>end example]</i> |
| flood (Flood) | <p>[Example: Consider the following example of the flood light rig applied to a basic shape:</p>  <i>end example]</i> |
| freezing (Freezing) | <p>[Example: Consider the following example of the freezing light rig applied to a basic shape:</p> |

| Enumeration Value | Description |
|-----------------------------|--|
| |  <i>end example]</i> |
| glow (Glow) | <p>[Example: Consider the following example of the glow light rig applied to a basic shape:</p>  <i>end example]</i> |
| harsh (Harsh) | <p>[Example: Consider the following example of the harsh light rig applied to a basic shape:</p>  <i>end example]</i> |

20.1.10.31 ST_LineCap (End Line Cap)

This simple type specifies how to cap the ends of lines. This also affects the ends of line segments for dashed lines.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------|---|
| flat (Flat Line Cap) | Line ends at end point. |
| rnd (Round Line Cap) | Rounded ends. Semi-circle protrudes by half line width. |
| sq (Square Line Cap) | Square protrudes by half line width. |

| Referenced By |
|--|
| ln@cap (§20.1.2.2.24); lnB@cap (§21.1.3.5); lnBToTr@cap (§21.1.3.6); lnL@cap (§21.1.3.7); lnR@cap (§21.1.3.8); lnT@cap (§21.1.3.9); lnTToBr@cap (§21.1.3.10); uLn@cap (§21.1.2.3.14) |

[*Note:* The W3C XML Schema definition of this simple type's content model ([ST_LineCap](#)) is located in §A.4.1. *end note*]

20.1.10.32 ST_LineEndLength (Line End Length)

This simple type represents the length of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[*Example:* See the example images below. These samples have an arrow line end type and medium line end width. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|-------------|
| lg (Large) | ➤ Large |
| med (Medium) | ➡ Medium |
| sm (Small) | ➡ Small |

| Referenced By |
|--|
| headEnd@len (§20.1.8.38); tailEnd@len (§20.1.8.57) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineEndLength](#)) is located in §A.4.1. *end note*]

20.1.10.33 ST_LineEndType (Line End Type)

This simple type represents the shape decoration that appears at the ends of lines. For example, one choice is an arrow head.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------|-----------------------|
| arrow (Arrow Head) | ➡ Line arrow head |
| diamond (Diamond) | ➡ Diamond |
| none (None) | — No end |
| oval (Oval) | ➡ Oval |
| stealth (Stealth Arrow) | ➡ Stealth arrow head |
| triangle (Triangle Arrow Head) | ➡ Triangle arrow head |

| Referenced By |
|--|
| headEnd@type (§20.1.8.38); tailEnd@type (§20.1.8.57) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_LineEndType](#)) is located in §A.4.1. *end note*]

20.1.10.34 ST_LineEndWidth (Line End Width)

This simple type represents the width of the line end decoration (e.g., arrowhead) relative to the width of the line itself.

[Example: See the example images below. These samples have an arrow line end type and medium line end length. *end example*]

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| lg (Large) |  Large |
| med (Medium) |  Medium |
| sm (Small) |  Small |

| Referenced By |

| headEnd@w (§20.1.8.38); tailEnd@w (§20.1.8.57) |

[Note: The W3C XML Schema definition of this simple type’s content model ([ST_LineEndWidth](#)) is located in §A.4.1. *end note*]

20.1.10.35 ST_LineWidth (Line Width)

This simple type specifies the width of a line in EMUs. 1 pt = 12700 EMUs.

This simple type's contents are a restriction of the ST_Coordinate32Unqualified datatype (§20.1.10.18).

This simple type also specifies the following restrictions:

- This simple type has a minimum value of greater than or equal to 0.
- This simple type has a maximum value of less than or equal to 20116800.

| Referenced By |
|--|
| ln@w (§20.1.2.2.24); lnB@w (§21.1.3.5); lnBlToTr@w (§21.1.3.6); lnL@w (§21.1.3.7); lnR@w (§21.1.3.8); lnT@w (§21.1.3.9); lnTlToBr@w (§21.1.3.10); uLn@w (§21.1.2.3.14) |

20.1.10.36 ST_OnOffStyleType (On/Off Style Type)

This simple type represents whether a style property should be applied.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|--|
| def (Default) | Follow parent settings. For a themed property, follow the theme settings. For an unthemed property, follow the parent setting in the property inheritance chain. |
| off (Off) | Property is off. |
| on (On) | Property is on. |

20.1.10.37 ST_PathFillMode (Path Fill Mode)

This simple type specifies the manner in which a path should be filled. The lightening and darkening of a path allow for certain parts of the shape to be colored lighter or darker depending on user preference.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------------------------|---|
| darken (Darken Path Fill) | This specifies that the corresponding path should have a darker shaded color applied to its fill. |
| darkenLess (Darken Path Fill Less) | This specifies that the corresponding path should have a slightly darker shaded color applied to its fill. |
| lighten (Lighten Path Fill) | This specifies that the corresponding path should have a lightly shaded color applied to its fill. |
| lightenLess (Lighten Path Fill Less) | This specifies that the corresponding path should have a slightly lighter shaded color applied to its fill. |
| none (No Path Fill) | This specifies that the corresponding path should have no fill. |
| norm (Normal Path Fill) | This specifies that the corresponding path should have a normally shaded color applied to its fill. |

20.1.10.38 ST_PathShadeType (Path Shade Type)

This simple type describes the shape of path to follow for a path gradient shade.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------|-------------------------------------|
| circle (Circle) | Gradient follows a circular path |
| rect (Rectangle) | Gradient follows a rectangular path |
| shape (Shape) | Gradient follows the shape |

| Referenced By |

20.1.10.39 ST_PenAlignment (Alignment Type)

This simple type specifies the Pen Alignment type for use within a text body.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|------------------------|---|
| ctr (Center Alignment) | Center pen (line drawn at center of path stroke). |
| in (Inset Alignment) | Inset pen (the pen is aligned on the inside of the edge of the path). |

| Referenced By |
|--|
| ln@algn (§20.1.2.2.24); lnB@algn (§21.1.3.5); lnBlToTr@algn (§21.1.3.6); lnL@algn (§21.1.3.7); lnR@algn (§21.1.3.8); lnT@algn (§21.1.3.9); lnTlToBr@algn (§21.1.3.10); uLn@algn (§21.1.2.3.14) |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PenAlignment](#)) is located in §A.4.1. *end note*]

20.1.10.40 ST_Percentage (Percentage)

This simple type specifies that its contents will contain a percentage value. See the union's member types for details.

This simple type is a union of the following types:

- The ST_Percentage simple type (§22.9.2.9).

| Referenced By |
|---|
| blue@val (§20.1.2.3.4); blueMod@val (§20.1.2.3.5); blueOff@val (§20.1.2.3.6); by@x (§19.5.21); by@y (§19.5.21); cTn@spd (§19.5.33); defRPr@baseline (§21.1.2.3.2); endParaRPr@baseline (§21.1.2.2.3); fillRect@b (§20.1.8.30); fillRect@l (§20.1.8.30); fillRect@r (§20.1.8.30); fillRect@t (§20.1.8.30); fillToRect@b (§20.1.8.31); fillToRect@l (§20.1.8.31); fillToRect@r (§20.1.8.31); fillToRect@t (§20.1.8.31); from@x (§19.5.44); from@y (§19.5.44); green@val (§20.1.2.3.10); greenMod@val (§20.1.2.3.11); greenOff@val (§20.1.2.3.12); hslClr@lum (§20.1.2.3.13); hslClr@sat (§20.1.2.3.13); lum@val (§20.1.2.3.19); lumMod@val (§20.1.2.3.20); lumOff@val (§20.1.2.3.21); outerShdw@sx (§20.1.8.45); outerShdw@sy (§20.1.8.45); presentation@serverZoom (§19.2.1.26); rCtr@x (§19.5.62); rCtr@y (§19.5.62); red@val (§20.1.2.3.23); redMod@val (§20.1.2.3.24); redOff@val (§20.1.2.3.25); reflection@sx (§20.1.8.50); reflection@sy (§20.1.8.50); relOff@tx (§20.1.8.51); relOff@ty (§20.1.8.51); rPr@baseline (§21.1.2.3.9); sat@val (§20.1.2.3.26); satMod@val (§20.1.2.3.27); satOff@val (§20.1.2.3.28); scrgbClr@b (§20.1.2.3.30); scrgbClr@g (§20.1.2.3.30); scrgbClr@r (§20.1.2.3.30); srcRect@b (§20.1.8.55); srcRect@l (§20.1.8.55); srcRect@r (§20.1.8.55); srcRect@t (§20.1.8.55); tile@sx (§20.1.8.58); tile@sy (§20.1.8.58); tileRect@b (§20.1.8.59); tileRect@l (§20.1.8.59); tileRect@r (§20.1.8.59); tileRect@t (§20.1.8.59); to@x (§19.5.88); to@y (§19.5.88); xfrm@sx (§20.1.8.61); xfrm@sy (§20.1.8.61) |

20.1.10.46 ST_PresetCameraType (Preset Camera Type)

These enumeration values represent different algorithmic methods for setting all camera properties, including position. The following example images below are all based off the following shape:

In this image, we can see the shape has a camera pointing directly at the front face.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| isometricBottomDown (Isometric Bottom Down) | <div>[Example: Consider the following example of the camera preset type:</div> <div></div> <div>end example]</div> |
| isometricBottomUp (Isometric Bottom Up) | <div>[Example: Consider the following example of the camera preset type:</div> <div></div> <div>end example]</div> |

| Enumeration Value | Description |
|---|---|
| isometricLeftDown (Isometric Left Down) | <p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p> |
| isometricLeftUp (Isometric Left Up) | <p>[<i>Example:</i> Consider the following example of the camera preset type:</p>  <p><i>end example]</i></p> |

[Note: The W3C XML Schema definition of this simple type's content model ([ST_PresetCameraType](#)) is located in §A.4.1. *end note*]

20.1.10.47 ST_PresetColorVal (Preset Color Value)

This simple type represents a preset color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| aliceBlue (Alice Blue Preset Color) | Specifies a color with RGB value (240,248,255) |
| antiqueWhite (Antique White Preset Color) | Specifies a color with RGB value (250,235,215) |
| aqua (Aqua Preset Color) | Specifies a color with RGB value (0,255,255) |
| aquamarine (Aquamarine Preset Color) | Specifies a color with RGB value (127,255,212) |
| azure (Azure Preset Color) | Specifies a color with RGB value (240,255,255) |
| beige (Beige Preset Color) | Specifies a color with RGB value (245,245,220) |
| bisque (Bisque Preset Color) | Specifies a color with RGB value (255,228,196) |
| black (Black Preset Color) | Specifies a color with RGB value (0,0,0) |
| blanchedAlmond (Blanched Almond Preset Color) | Specifies a color with RGB value (255,235,205) |
| blue (Blue Preset Color) | Specifies a color with RGB value (0,0,255) |
| blueViolet (Blue Violet Preset Color) | Specifies a color with RGB value (138,43,226) |
| brown (Brown Preset Color) | Specifies a color with RGB value (165,42,42) |
| burlyWood (Burly Wood Preset Color) | Specifies a color with RGB value (222,184,135) |

| Enumeration Value | Description |
|--|--|
| cadetBlue (Cadet Blue Preset Color) | Specifies a color with RGB value (95,158,160) |
| chartreuse (Chartreuse Preset Color) | Specifies a color with RGB value (127,255,0) |
| chocolate (Chocolate Preset Color) | Specifies a color with RGB value (210,105,30) |
| coral (Coral Preset Color) | Specifies a color with RGB value (255,127,80) |
| cornflowerBlue (Cornflower Blue Preset Color) | Specifies a color with RGB value (100,149,237) |
| cornsilk (Cornsilk Preset Color) | Specifies a color with RGB value (255,248,220) |
| crimson (Crimson Preset Color) | Specifies a color with RGB value (220,20,60) |
| cyan (Cyan Preset Color) | Specifies a color with RGB value (0,255,255) |
| darkBlue (Dark Blue Preset Color) | Specifies a color with RGB value (0,0,139) |
| darkCyan (Dark Cyan Preset Color) | Specifies a color with RGB value (0,139,139) |
| darkGoldenrod (Dark Goldenrod Preset Color) | Specifies a color with RGB value (184,134,11) |
| darkGray (Dark Gray Preset Color) | Specifies a color with RGB value (169,169,169) |
| darkGreen (Dark Green Preset Color) | Specifies a color with RGB value (0,100,0) |
| darkGrey (Dark Gray Preset Color) | Specifies a color with RGB value (169,169,169) |
| darkKhaki (Dark Khaki Preset Color) | Specifies a color with RGB value (189,183,107) |
| darkMagenta (Dark Magenta Preset Color) | Specifies a color with RGB value (139,0,139) |
| darkOliveGreen (Dark Olive Green Preset Color) | Specifies a color with RGB value (85,107,47) |
| darkOrange (Dark Orange Preset Color) | Specifies a color with RGB value (255,140,0) |
| darkOrchid (Dark Orchid Preset Color) | Specifies a color with RGB value (153,50,204) |
| darkRed (Dark Red Preset Color) | Specifies a color with RGB value (139,0,0) |
| darkSalmon (Dark Salmon Preset Color) | Specifies a color with RGB value (233,150,122) |
| darkSeaGreen (Dark Sea Green Preset Color) | Specifies a color with RGB value (143,188,143) |
| darkSlateBlue (Dark Slate Blue Preset Color) | Specifies a color with RGB value (72,61,139) |
| darkSlateGray (Dark Slate Gray Preset Color) | Specifies a color with RGB value (47,79,79) |
| darkSlateGrey (Dark Slate Gray Preset Color) | Specifies a color with RGB value (47,79,79) |
| darkTurquoise (Dark Turquoise Preset Color) | Specifies a color with RGB value (0,206,209) |
| darkViolet (Dark Violet Preset Color) | Specifies a color with RGB value (148,0,211) |
| deepPink (Deep Pink Preset Color) | Specifies a color with RGB value (255,20,147) |
| deepSkyBlue (Deep Sky Blue Preset Color) | Specifies a color with RGB value (0,191,255) |
| dimGray (Dim Gray Preset Color) | Specifies a color with RGB value (105,105,105) |
| dimGrey (Dim Gray Preset Color) | Specifies a color with RGB value (105,105,105) |
| dkBlue (Dark Blue Preset Color) | Specifies a color with RGB value (0,0,139) |
| dkCyan (Dark Cyan Preset Color) | Specifies a color with RGB value (0,139,139) |
| dkGoldenrod (Dark Goldenrod Preset Color) | Specifies a color with RGB value (184,134,11) |

| Enumeration Value | Description |
|--|--|
| dkGray (Dark Gray Preset Color) | Specifies a color with RGB value (169,169,169) |
| dkGreen (Dark Green Preset Color) | Specifies a color with RGB value (0,100,0) |
| dkGrey (Dark Gray Preset Color) | Specifies a color with RGB value (169,169,169) |

20.1.10.48 ST_PresetLineDashVal (Preset Line Dash Value)

This simple type represents preset line dash values. The description for each style shows an illustration of the line style. Each style also contains a precise binary representation of the repeating dash style. Each 1 corresponds to a line segment of the same length as the line width, and each 0 corresponds to a space of the same length as the line width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|----------------------------|---|
| dash (Dash) |  1111000 |
| dashDot (Dash Dot) |  11110001000 |
| dot (Dot) |  1000 |

20.1.10.49 ST_PresetMaterialType (Preset Material Type)

Describes surface appearance of a shape. The material type combines with lighting characteristics to create the final look and feel of a shape. The set of material properties which can be combined together to create the presets below consist of the following characteristics:

- Specular color – This defines the color of the highlight associated with the material.
- Specular power – This defines the size and how intense the highlight is. Smaller values provide a larger, but less intense highlight, while larger values provide a smaller, but more intense highlight.
- Diffuse color – This defines the perceived color of the material where an object is directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.
- Ambient color – This defines the perceived color of the material where an object is not directly illuminated by a light source. Generally speaking, the default color here would be based on the shape fill color.
- Emissive color – This defines the color of a light which is perceived to be given off by an object.
- Diffuse Fresnel effect – This is an effect that either darkens (approaches black) or lightens (approaches white) the diffuse color of the material type at glancing angles. Positive values cause the material to become brighter, negative values cause the material to become darker.
- Alpha Fresnel effect – This is an effect that either makes the material more opaque or more transparent at glancing angles. Positive values cause the material to become more opaque, negative values cause the material to become more transparent.

In the following examples, the exact values given for certain properties should be understood to be relative values in order to provide a reference. These values could be different depending upon technologies used to render the material types. The following properties were used to define the shape used in the image examples below:

- Rounded rectangle shape
- Circle bevel type
- Three Point light rig type
- Camera type defined by the `perspectiveContrastingRightFacing` preset
- Bevel width and height each equal to 190500

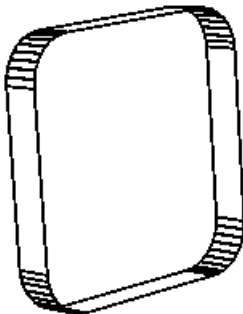

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|--------------------|---|
| clear (Clear) | <p>The <code>clear</code> material type has the following characteristics:</p> <ul style="list-style-type: none"> • Specular Color: light gray • Diffuse Color: shape fill color with 90% alpha • Ambient Color: shape fill color with 90% alpha • Emissive Color: black • Diffuse Fresnel value: -8 • Alpha Fresnel value: 1 <p>[<i>Example:</i> Consider the following example of the <code>clear</code> material type:</p>  <p><i>end example]</i></p> |

20.1.10.51 ST_PresetShadowVal (Preset Shadow Type)

This simple type indicates one of 20 preset shadow types. Each enumeration value description illustrates the type of shadow represented by the value. Each description contains the parameters to the outer shadow effect represented by the preset, in addition to those attributes common to all prstShdw effects.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|--|
| shdw1 (Top Left Drop Shadow) |  No additional attributes specified. |
| shdw10 (Top Left Large Drop Shadow) |  align = "br" sx = 125% sy = 125% |
| shdw11 (Back Left Long Perspective Shadow) |  align = "b" kx = 40.89° sy = 50% |
| shdw12 (Back Right Long Perspective Shadow) |  align = "b" |

| Enumeration Value | Description |
|---|--|
| | $kx = -40.89^\circ$ $sy = 50\%$ |
| shdw13 (Top Left Double Drop Shadow) |  <p>Equivalent to two outer shadow effects.</p> <p>Shadow 1: No additional attributes specified.</p> <p>Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dist = 2 * shadow 1's distance</p> |
| shdw14 (Bottom Right Small Drop Shadow) |  <p>No additional attributes specified.</p> |
| shdw15 (Front Left Long Perspective Shadow) |  <p>align = "b" $kx = 40.89^\circ$ $sy = -50\%$</p> |
| shdw16 (Front Right LongPerspective Shadow) |  <p>align = "b" $kx = -40.89^\circ$ $sy = -50\%$</p> |
| shdw17 (3D Outer Box Shadow) |  <p>Equivalent to two outer shadow effects.</p> <p>Shadow 1: No additional attributes specified.</p> <p>Shadow 2: color = min(1, shadow 1's color (0 <= r, g, b <= 1) + 102/255), per r, g, b component dir = shadow 1's direction + 180°</p> |
| shdw18 (3D Inner Box Shadow) |  <p>Equivalent to two outer shadow effects.</p> <p>Shadow 1: No additional attributes specified.</p> |

| Enumeration Value | Description |
|---|---|
| | Shadow 2: color = min(1, shadow 1's color ($0 \leq r, g, b \leq 1$) + 102/255), per r, g, b component dir = shadow 1's direction + 180° |
| shdw19 (Back Center Perspective Shadow) |  align = "b" sy = 50° |
| shdw2 (Top Right Drop Shadow) |  No additional attributes specified. |
| shdw20 (Front Bottom Shadow) |  align = "b" sy = -100° |
| shdw3 (Back Left Perspective Shadow) |  align = "b" ky = 40.89° sy = 50% |
| shdw4 (Back Right Perspective Shadow) |  align = "b" kx = -40.89° sy = 50% |
| shdw5 (Bottom Left Drop Shadow) |  No additional attributes specified. |
| shdw6 (Bottom Right Drop Shadow) |  No additional attributes specified. |
| shdw7 (Front Left Perspective Shadow) |  align = "b" kx = 40.89° sy = -50% |
| shdw8 (Front Right Perspective Shadow) |  align = "b" kx = -40.89° sy = -50% |
| shdw9 (Top Left Small Drop Shadow) |  align = "tl" sx = 75% |

| Enumeration Value | Description |

20.1.10.53 ST_SchemeColorVal (Scheme Color)

This simple type represents a scheme color value.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|-------------------------------------|--|
| accent1 (Accent Color 1) | Extra scheme color 1 |
| accent2 (Accent Color 2) | Extra scheme color 2 |
| accent3 (Accent Color 3) | Extra scheme color 3 |
| accent4 (Accent Color 4) | Extra scheme color 4 |
| accent5 (Accent Color 5) | Extra scheme color 5 |
| accent6 (Accent Color 6) | Extra scheme color 6 |
| bg1 (Background Color 1) | Semantic background color |
| bg2 (Background Color 2) | Semantic additional background color |
| dk1 (Dark Color 1) | Main dark color 1 |
| dk2 (Dark Color 2) | Main dark color 2 |
| folHlink (Followed Hyperlink Color) | Followed Hyperlink Color |
| hlink (Hyperlink Color) | Regular Hyperlink Color |
| lt1 (Light Color 1) | Main Light Color 1 |
| lt2 (Light Color 2) | Main Light Color 2 |
| phClr (Style Color) | A color used in theme definitions which means to use the color of the style. |
| tx1 (Text Color 1) | Semantic text color |
| tx2 (Text Color 2) | Semantic additional text color |

20.1.10.55 ST_ShapeType (Preset Shape Types)

This simple type specifies the preset shape geometry that is to be used for a shape. An enumeration of this simple type is used so that a custom geometry does not have to be specified but instead can be constructed automatically by the generating application. For each enumeration listed there is also the corresponding DrawingML code that would be used to construct this shape were it a custom geometry. Within the construction code for each of these preset shapes there are predefined guides that the generating application shall maintain for calculation purposes at all times. The necessary guides should have the following values.

3/4 of a Circle ('3cd4') - Constant value of "16200000.0"

The units here are in 60,000ths of a degree. This is equivalent to 270 degrees.

3/8 of a Circle ('3cd8') - Constant value of "8100000.0"

The units here are in 60,000ths of a degree. This is equivalent to 135 degrees.

5/8 of a Circle ('5cd8') - Constant value of "13500000.0"

The units here are in 60,000ths of a degree. This is equivalent to 225 degrees.

7/8 of a Circle ('7cd8') - Constant value of "18900000.0"

The units here are in 60,000ths of a degree. This is equivalent to 315 degrees.

Shape Bottom Edge ('b') - Constant value of "h"

This is the bottom edge of the shape and since the top edge of the shape is considered the 0 point, the bottom edge is thus the shape height.

1/2 of a Circle ('cd2') - Constant value of "10800000.0"

The units here are in 60,000ths of a degree. This is equivalent to 180 degrees.

1/4 of a Circle ('cd4') - Constant value of "5400000.0"

The units here are in 60,000ths of a degree. This is equivalent to 90 degrees.

1/8 of a Circle ('cd8') - Constant value of "2700000.0"

The units here are in 60,000ths of a degree. This is equivalent to 45 degrees.

Shape Height ('h')

This is the variable height of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

Horizontal Center ('hc') - Calculated value of "*" / w 1.0 2.0"

This is the horizontal center of the shape which is just the width divided by 2.

1/2 of Shape Height ('hd2') - Calculated value of "*" / h 1.0 2.0"

This is 1/2 the shape height.

1/4 of Shape Height ('hd4') - Calculated value of "*" / h 1.0 4.0"

This is 1/4 the shape height.

1/5 of Shape Height ('hd5') - Calculated value of "*" / h 1.0 5.0"

This is 1/5 the shape height.

1/6 of Shape Height ('hd6') - Calculated value of $h / 6$

This is 1/6 the shape height.

1/8 of Shape Height ('hd8') - Calculated value of $h / 8$

This is 1/8 the shape height.

Shape Left Edge ('l') - Constant value of 0

This is the left edge of the shape and the left edge of the shape is considered the horizontal 0 point.

Longest Side of Shape ('ls') - Calculated value of $\max(w, h)$

This is the longest side of the shape. This value is either the width or the height depending on which is greater.

Shape Right Edge ('r') - Constant value of w

This is the right edge of the shape and since the left edge of the shape is considered the 0 point, the right edge is thus the shape width.

Shortest Side of Shape ('ss') - Calculated value of $\min(w, h)$

This is the shortest side of the shape. This value is either the width or the height depending on which is smaller.

1/2 Shortest Side of Shape ('ssd2') - Calculated value of $ss / 2$

This is 1/2 the shortest side of the shape.

1/4 Shortest Side of Shape ('ssd4') - Calculated value of $ss / 4$

This is 1/4 the shortest side of the shape.

1/6 Shortest Side of Shape ('ssd6') - Calculated value of $ss / 6$

This is 1/6 the shortest side of the shape.

1/8 Shortest Side of Shape ('ssd8') - Calculated value of $ss / 8$

This is 1/8 the shortest side of the shape.

Shape Top Edge ('t') - Constant value of 0

This is the top edge of the shape and the top edge of the shape is considered the vertical 0 point.

Vertical Center of Shape ('vc') - Calculated value of $h / 2$

This is the vertical center of the shape which is just the height divided by 2.

Shape Width ('w')

This is the variable width of the shape defined in the shape properties. This value is received from the shape transform listed within the <spPr> element.

1/2 of Shape Width ('wd2') - Calculated value of $w / 2$

This is 1/2 the shape width.

1/4 of Shape Width ('wd4') - Calculated value of $w / 4$

This is 1/4 the shape width.

1/5 of Shape Width ('wd5') - Calculated value of $w / 5$

This is 1/5 the shape width.

1/6 of Shape Width ('wd6') - Calculated value of $w / 6$

This is 1/6 the shape width.

1/8 of Shape Width ('wd8') - Calculated value of $w / 8$

This is 1/8 the shape width.

1/10 of Shape Width ('wd10') - Calculated value of "*" / w 1.0 10.0"

This is 1/10 the shape width.

This simple type's contents are a restriction of the W3C XML Schema token datatype.

This simple type is restricted to the values listed in the following table:

| Enumeration Value | Description |
|---|---|
| accentBorderCallout1 (Callout 1 with Border and Accent Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout1 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| accentBorderCallout2 (Callout 2 with Border and Accent Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| accentBorderCallout3 (Callout 3 with Border and Accent Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the accentBorderCallout3 element in the preset</p> |

This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the donut element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| doubleWave (Double Wave Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the doubleWave element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> |

| Enumeration Value | Description |
|---|--|
| |  |
| downArrow (Down Arrow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the downArrow element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| downArrowCallout (Callout Down Arrow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the downArrowCallout element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| ellipse (Ellipse Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipse element in the preset shape geometries</p> |

| Enumeration Value | Description |
|---|---|
| | <p>electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>ellipseRibbon (Ellipse Ribbon Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipseRibbon element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>ellipseRibbon2 (Ellipse Ribbon 2 Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the ellipseRibbon2 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartAlternateProcess (Alternate Process Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> |

| Enumeration Value | Description |
|---|--|
| | <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartAlternateProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartCollate (Collate Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartCollate element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartConnector (Connector Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartDecision (Decision Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> |

| Enumeration Value | Description |
|---|---|
| | <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDecision element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartDelay (Delay Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDelay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartDisplay (Display Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartDisplay element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartDocument (Document Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|--|---|
| | <p>generate this preset shape definition is contained in the flowChartDocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartExtract (Extract Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartExtract element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartInputOutput (Input Output Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartInputOutput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartInternalStorage (Internal Storage Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|--|--|
| | <p>generate this preset shape definition is contained in the flowChartInternalStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartMagneticDisk (Magnetic Disk Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMagneticDisk element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartMagneticDrum (Magnetic Drum Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMagneticDrum element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartMagneticTape (Magnetic Tape Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|---|---|
| | <p>generate this preset shape definition is contained in the flowChartMagneticTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartManualInput (Manual Input Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartManualInput element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartManualOperation (Manual Operation Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartManualOperation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartMerge (Merge Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in</p> |

| Enumeration Value | Description |
|--|--|
| | <p>the flowChartMerge element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p>  |
| <p>flowChartMultidocument (Multi-Document Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartMultidocument element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartOfflineStorage (Offline Storage Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartOfflineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| <p>flowChartOffpageConnector (Off-Page Connector Flow Shape)</p> | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|--|---|
| | <p>generate this preset shape definition is contained in the flowChartOffpageConnector element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartOnlineStorage (Online Storage Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartOnlineStorage element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartOr (Or Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartOr element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartPredefinedProcess (Predefined Process Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|--|---|
| | <p>generate this preset shape definition is contained in the flowChartPredefinedProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i></p>  |
| flowChartPreparation (Preparation Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPreparation element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartProcess (Process Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartProcess element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartPunchedCard (Punched Card Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to</p> |

| Enumeration Value | Description |
|---|---|
| | <p>generate this preset shape definition is contained in the flowChartPunchedCard element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartPunchedTape (Punched Tape Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartPunchedTape element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartSort (Sort Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartSort element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartSummingJunction (Summing Junction Flow | <p>Specifies a preset shape geometry. This geometry shall</p> |

| Enumeration Value | Description |
|---|--|
| Shape) | <p>be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartSummingJunction element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| flowChartTerminator (Terminator Flow Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the flowChartTerminator element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| foldedCorner (Folded Corner Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note:</i> An example of DrawingML which can be used to generate this preset shape definition is contained in the foldedCorner element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| frame (Frame Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> |

| Enumeration Value | Description |
|-----------------------|--|
| | <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the frame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| funnel (Funnel Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the funnel element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| gear6 (Gear 6 Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[Note: An example of DrawingML which can be used to generate this preset shape definition is contained in the gear6 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| gear9 (Gear 9 Shape) | <p>Specifies a preset shape geometry. This geometry shall</p> |

| Enumeration Value | Description |
|------------------------------|--|
| | <p>be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the gear9 element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| halfFrame (Half Frame Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the halfFrame element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p>  |
| heart (Heart Shape) | <p>Specifies a preset shape geometry. This geometry shall be designed to match the normative image below.</p> <p>[<i>Note</i>: An example of DrawingML which can be used to generate this preset shape definition is contained in the heart element in the preset shape geometries electronic addenda of Annex D. The constants used in that markup are guides that are described in further detail above. <i>end note</i>]</p> |
