Introduction

This Technical Report (TR) has been produced by ETSI Technical Committee Telecommunications and Internet converged Services and Protocols for Advanced Networking (TISPAN) in close collaboration with Ecma in the context of a Common Work Item.

This Ecma Technical Report has been adopted by the General Assembly of June 2011.

Business Trunking - NGCN-NGN Interfaces Implementation Guide

1 Scope

The purpose of the present document is to give an implementation guide to the relevant Common IMS specifications and functions used in the interconnection of a Next Generation Corporate Network site (NGCN site) to the Next Generation Network (NGN).

The present document addresses control plane signalling (usage of SIP and SDP protocols, required SIP headers) as well as other interconnecting aspects like security, numbering/naming/addressing and user plane issues such as transport protocol, media and codecs actually covered in a widespread set of 3GPP and ETSI TISPAN specifications, as seen from the perspective of an NGCN site.

Advice-of-charge aspects are addressed as far as SIP signalling is concerned.

The present document is based on TS 124 229 Release 7 [i.12] as modified by ES 283 003 Release 2 [i.15].

NOTE Some errors corrected in TS 124 229 Release 8 and 9 are already taken into account in the present document.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 180 000 [i.85], TS 181 019 [i.2], TS 182 025 [i.3] and the following apply:

NGCN Attachment Point
SIP entity inside the NGCN with a direct SIP interface to the NGN

3.2 Abbreviations

For the purposes of the present document, the abbreviations given in TR 180 000 [i.85], TS 181 019 [i.2], TS 182 025 [i.3] and the following apply.

NGCN	Next Generation Corporate Network
NGN	Next Generation Network

4 Overview

4.1 Business Trunking architecture and protocols

Business trunking refers to an architecture where corporate networks appear to the NGN as an NGCN.

TS 182 025 [i.3] and TS 181 019 [i.2] provide architecture and functional requirements for business trunking making use of IMS and foresee two main interconnection models: the subscription based approach, where the entry point to the IMS is the P-CSCF, and the peering based approach, where the entry point to the IMS is the IBCF.

In both arrangement scenarios, aiming to support business trunking, protocol interconnection has to occur between NGCN and NGN:

- at a control plane level, in order that IMS procedures can be supported;
- at a user plane level, where media streams are exchanged.

The management of IP multimedia sessions is achieved using SIP. The transport mechanism for both SIP session signalling and media is UDP or TCP over IPv4 (RFC 791 [i.13]) or IPv6 (RFC 2460 [i.14]); for signalling optionally also TLS over TCP.

The protocol behaviour of the NGN functional entities involved in the signalling plane interconnection (IBCF, P-CSCF) is specified in TS 124 229 [i.12], taking into account the modifications specified in ES 283 003 [i.15].

The protocol behaviour of the NGCN is also expected to follow TS 124 229 [i.12], taking into account the modifications specified in ES 283 003 [i.15], subject to the applicable interconnection scenario:

- for the subscription-based approach the behaviour is based on the rules for a UE;
- for the peering-based approach the NGCN site appears to the NGN as if it were an IBCF complying with the requirements identified in TS 124 229 [i.12], clause 4.1 for this functional entity.

The present document presents guidelines for NGCNs connecting to an NGN for the purpose of business trunking.

NOTE A given NGCN can have multiple business trunking arrangements with the same NGN or with different NGNs, some using the subscription-based approach and others using the peering-based approach.

4.2 Roadmap to relevant specifications

The following specifications are relevant for the implementation of the NGCN-NGN interface:

- TS 181 019 [i.2] provides Business Communication Requirements.
- TS 182 023 [i.4] provides architecture and functional description of Core and enterprise NGN interaction scenarios.
- TS 182 025 [i.3] gives architecture and functional description of Business trunking.
- TS 124 229 [i.12] defines a call control protocol for use in the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP), and the associated Session Description Protocol (SDP).
- ES 283 003 [i.15] provides the ETSI TISPAN endorsement of TS 124 229 [i.12] in line with the requirements of TISPAN NGN.

4.3 Specification methodology

4.3.1 General

Clauses 5, 6 and 7 of the present document describe the various aspects of an NGN-NGCN interconnection, including a description of SIP and SDP procedures, and the SIP methods and header fields to be supported, in the form of a series of tables and description.

Aspects common to both the subscription-based and the peering-based scenario are described in clause 5. Considerations for a particular scenario are covered in clauses 6 and 7 respectively.

The tables summarize key aspects of IMS SIP used in business trunking and are aligned with similar tables available in Annex A of TS 124 229 [i.12] as modified by ES 283 003 [i.15]. Each of the tables in the present document include two "Status" columns, one for the sending side, one for the receiving side. The status entries represent the requirements on an NGCN acting as sender / as receiver of a SIP message. The present document is an informative document and as such does not specify any changes to SIP described in TS 124 229 [i.12] as modified by ES 283 003 [i.15].

NOTE 1 ES 283 003 [i.15] refers to TS 124 503 [i.93] which at the time of publication of the present document was still under development. The present document anticipates some changes that may be required to these baseline specifications in order to fully align with business trunking requirements and protocol impacts described in TS 182 025 [i.3]. Such anticipated changes are made clear through the use of notes.

NOTE 2 The present document in some cases selects options from the baseline specifications. As an example, if the "status" column in the baseline specification indicates a condition for supporting a particular header field and that condition is always met by the implementation of the interface to an NGCN site then the "profile status" column for this header field is marked "mandatory" rather than "optional" or "conditionally mandatory" in the present document. Similarly if the "status" column in the baseline specification indicates that support of a particular header field is optional and the implementation of the interface to an NGCN site always require it then the "profile status" column for this header field is marked "mandatory" rather than "optional".

The notation for status codes is explained in clause 4.3.2.

There are cases where the status of a method or a header field depends on capabilities supported at the NGCN-NGN interface. In such a case, the status indicated in the tables depends on the status of the respective capability, as described in clause 4.4.

4.3.2 Notation for status codes

The following notations, defined in ISO/IEC 9646-7 [i.41], are used for the status column:

- m mandatory - the capability is required to be supported.
- o optional - the capability may be supported or not.
- n/a not applicable - in the given context, it is impossible to use the capability.
- x prohibited (excluded) - there is a requirement not to use this capability in the given context.
- o.i qualified optional - for mutually exclusive or selectable options from a set. "i" is an integer, which identifies a unique group of related optional items and the logic of their selection, which is defined immediately following the table.
- ci conditional - the requirement on the capability ("m", "o", "x" or "n/a") depends on the support of other optional or conditional items. "i" is an integer identifying a unique conditional status expression which is defined immediately following the table.

In the status columns of tables within subsequent sections, status codes m, o, c, x and n/a have the following meanings, as specified in the base standards, with the following qualifications:

- Conformance requirements are indicated in static terms, meaning that a behaviour indicated as mandatory shall be observed when the implementation is placed in conditions in which the conformance requirements of the reference specification compel it to do so. For instance, if the support for a header field in a sent message is indicated as mandatory, it does not mean that the NGCN shall always include that header field when sending the message concerned, but that the NGCN shall include that header field in the message concerned in circumstances specified in the reference specification.

- If support for a particular behaviour is required, there is no requirement for every SIP-capable entity within the NGCN to support that behaviour, but at least one element involved shall support that behaviour. For instance, if the support for a header field in a sent message is indicated as mandatory, it does not mean that all NGCN entities involved in handling the message to be sent shall support inclusion of that header field, but at least one NGCN entity shall be able to insert that header field such that it appears in the resulting message sent to the NGN.

- When appearing in a column relating to sending by an NGCN, the notation 'm' means that an NGCN shall support this capability when sending a message.

- When appearing in a column relating to receiving by an NGCN, the notation 'm' means that an NGCN shall support this capability when present in a received message.

- The notation 'o' means that the capability may or may not be supported by an NGCN, this being an implementation choice.

- When appearing in a column relating to sending by an NGCN, the notation 'n/a' means that there is no requirement for an NGCN to support this capability when sending a message.

- When appearing in a column relating to receiving by an NGCN, the notation 'n/a' means that there is no requirement for an NGCN to support this capability when present in a received message.

- When appearing in a column relating to sending by an NGCN, the notation 'x' means that an NGCN shall not use this capability when sending a message.

- When appearing in a column relating to receiving by an NGCN, the notation 'x' means that an NGCN shall ignore this capability when present in a received message.

NOTE The current specifications 24.229 Release 8 and beyond 24.503 do not allow the usage of the GRUU for a complex UE.

4.4 Major capabilities at the NGCN-NGN interface

4.4.1 Service capabilities

Table 4.1 describes the Service Capabilities supported by NGCN at the NGCN-NGN interface.

Table 4.1 — Major capabilities supported by NGCN at the NGCN-NGN interface

Item	Does the implementation support	Reference	Status
1	Advice of Charge as a Client	TS 182 025 [i.3], clause 6.1.12	o
2	Multimedia telephony service	TS 124 173 [i.90]	o

4.4.2 Protocol capabilities

4.4.2.1 General

The NGCN is expected to support the following SIP capabilities under the stated circumstances.

4.4.2.2 Basic requirements

- **Session control:** The support of INVITE initiated dialogs is mandatory if media sessions are supported across the NGCN - NGN interface where media can be any mix of audio, video, and application data. In subscription-based approach both UAC and UAS side procedures are applicable; in peering-based approach proxy procedures may apply as well.
- **Registration, client side:** Mandatory when working in subscription mode, not applicable in peering mode.
- **Event notification framework:** SUBSCRIBE/NOTIFY support is mandatory if any SIP event package is supported. Depending on the package the NGCN will act as subscriber or as notifier.
- **Event state publication:** Support of the PUBLISH method is optional.
- **Messaging:** Support of the MESSAGE method is mandatory if instant messages are supported. There is no specific use case specified in TS 182 025 [i.3] that requires an NGCN to send the MESSAGE method. See table 5.1 for details on the support of the MESSAGE method on sending and receiving sides. In TS 123 228 [i.17] it is only specified for a UE to support Messaging, that implies that it is mandatory in the case of Subscription based approach.
- **UA-UA Authentication (Digest)** (see [i.1], clause 22.2): mandatory for REPLACES or JOIN else optional.
- **UA-Proxy Authentication (Digest)** (see [i.1], clause 20.28, 22.3): optional.

4.4.2.3 Extensions for session control

The following bullets list a number of SIP extensions and their status for the NGCN-NGN interface. The list is not exhaustive but contains all items relevant to the NGCN-NGN interface.

- **Fixes for non-INVITE transactions** (see [i.61]): mandatory.
- **Fork-loop fixes** (see [i.53]): mandatory if forking in NGCN is possible else not applicable.
- **Reliable provisional responses (PRACK)** (see [i.6]): mandatory if using session preconditions else optional.
- **INFO method** (see [i.5]): optional; required for AoC.
- **REFER method, Referred-by header field** (see [i.7], [i.33]): both optional.
- **UPDATE method** (see [i.8]): optional.
- **Session Preconditions (for QoS)** (see [i.54], [i.55]): mandatory if initiating a session requiring resource reservation else optional.
- **Symmetric response routing** (see [i.58]): optional.
- **Caller preferences** (see [i.23]): optional.
- **Callee capabilities** (see [i.59]): optional.

- **Replaces** (see [i.39]): optional.
- **Join** (see [i.26]): optional.
- **P-Asserted-Identity** (see [i.29]): mandatory.
- **Privacy** (see [i.30]): mandatory (privacy value 'id').
- **P-Called-Party-ID** (see [i.28]): optional; not applicable for peering mode.
- **P-Access-Network-Info** (see [i.28]): mandatory for GPRS, 3GPP2, I-WLAN and DOCSIS IP-CAN access types and optional for the others.
- **Session timer** (see [i.27]): optional.
- **UA-UA and UA-Proxy Authentication (Digest)** (see [i.1]): both optional.
- **History-Info and privacy of history info** (see [i.25]): optional.
- **GRUUs** (see [i.63]): optional.
- **ICE** (see [i.72]): optional.
- **SIP Outbound** (see [i.65]): optional.
- **Location conveyance** (see [i.24]): optional.
- **Service URNs (e.g. 'sos')** (see [i.62]): mandatory.
- **Private Network Traffic** (see [i.77]): optional.
- **Authorization of Early Media** (see [i.38]): optional.
- **Identification of communication services extension (P-Preferred-Service)** (see [i.34]): optional in the subscription-based approach, not applicable in the peering based approach.

4.4.2.4 Extensions for registration (subscription based approach only)

The following bullets list a number of SIP extensions and their status for the NGCN-NGN interface. The list is not exhaustive but contains all items relevant to the NGCN-NGN interface.

- **UA-Registrar Authentication** (see [i.1]): mandatory.
- **Session initiation protocol extension header field for registering non-adjacent contacts (Path header field)** (see [i.56]): mandatory. The support of the extension is indicated in the Supported header field sent by the NGCN. It is up to the NGCN whether it uses the Path header field received in the 200 OK response.
- **Reg-event package** (see [i.45]): mandatory.

Subscription to the reg-event package provided by the NGN enables the NGN with the following capabilities:

— informing the NGCN about the implicitly registered public user identities;

— informing the NGCN about the registration state of all explicitly and implicitly registered public user identities;

— forcing the NGCN at any time to perform re-registration after a NGN determined time (network initiated re-registration);

— network initiated de-registration of one or more registered public user identities of the NGCN.

NOTE 1 TS 124 229 [i.12] mandates the support of the 'reg' event package. In particular the last two capabilities above are needed by the NGN operator e.g. in cases when the network wants to re-authenticate the user (network initiated re-registration) or when the S-CSCF needs to shut down for maintenance purposes and the user should register newly at a different S-CSCF (network initiated de-registration).

- Session initiation protocol extension header field for service route discovery during registration (Service-Route header field) (see [i.57]): mandatory. If the UE does not set the content of the Service-Route received during the last successful registration or re-registration, in a Route header field of an outgoing SIP Request, the P-CSCF may reject this request.

- The P-Associated-URI header extension (P-Associated-URI header field) (see [i.29]): mandatory.

NOTE 2 TS 124 229 [i.12] mandates the support of the P-Associated-URI header field to enable the NGN to provide to the UE the implicitly registered public user identities. There is no requirement in TS 182 025 [i.3] to use this header field inside the NGCN site.

- **Security mechanism agreement** (see [i.32]): mandatory if SIP Digest with TLS or IMS AKA plus IPsec ESP is used to secure the signalling exchange between the UE and the network else optional (see TS 124 229 [i.12], clause 5.1.1.5, TS 133 203 [i.52], clause 6 and TS 133 203 [i.52], annexes N and O).

- **SIP extensions for media authorization** (see [i.37]): mandatory if initiating session and GPRS else n/a.

5 Common guidelines

5.1 Reference model for interconnection

The reference model for interconnection is scenario specific; refer to clause 6.1 for the subscription-based approach and to clause 7.1 for the peering based method of interconnection.

5.2 Control plane interconnection

5.2.1 SIP procedures

5.2.1.1 Outgoing requests from NGCN site

5.2.1.1.1 General

The following clauses provide guidance on the expected NGCN site behaviour when sending a request to the NGN and receiving a response from the NGN. Allowed formats for URIs are listed in clause 5.4, but other formats may possibly be used by agreement between enterprise and NGN.

The terms **trust**, **trusted by** and **trust domain** in the following clauses are used as defined in RFC 3324 [i.82] and relate only to the handling of P-Asserted-Identity and Privacy:id header fields as specified in RFC 3325 [i.29].
RFC 3324 [i.82] defines Spec (T) as the set of specifications and configuration settings that are used to ensure trust.

The trust relationship between NGCN sites and NGN is a matter of an SLA between enterprise and NGN operator. If according to the SLA the NGN and NGCN form part of the same trust domain, the SLA includes a Spec (T) applicable to the interconnection of NGCN and NGN. In this case the NGN trusts the NGCN site and vice versa (as described in RFC 3324 [i.82]). On the other hand the NGCN site may trust the NGN even if the NGCN site is not in the trust domain of the NGN.

NOTE 1 TS 182 025 [i.3] talks about trust only in the context of the NGN trusting the NGCN regarding the SIP header fields P-Asserted-Identity and related Privacy provided by the NGCN in a SIP request or SIP response.

NOTE 2 According to RFC 3324 [i.82], for an NGCN site outside the trust domain, trusting the NGN implies both secured signalling and knowledge that the peer NGN entity belongs to a recognized trust domain. As a consequence signalling that is not secured is equivalent to not trusting the NGN

NOTE 3 Trust is required if privacy applies; for identities that are not subject to privacy it is a matter of policy whether they are passed to a non-trusted node.

5.2.1.1.2 Calling and connected identifiers

When sending a request to the NGN the NGCN site can include a calling party identity in the P-Asserted-Identity header field in accordance with RFC 3325 [i.29].

NOTE 1 If included, the asserted identity is in addition to the identity provided by the calling party in the From header field.

The NGCN site can provide two P-Asserted-Identity header fields, one containing a SIP URI and the other containing a TEL URI, in order to provide alias identities for the calling party (see TS 181 019 [i.2]).

The handling of the P-Asserted-Identity header field(s) by the NGN depends on whether the NGN trusts the NGCN or not and on the scenario (subscription based or peering).

NOTE 2 If the NGN trusts the NGCN site it will accept a P-Asserted-Identity received from the NGCN.

A calling identifier in a From or P-Asserted-Identity header field is expected to comply with the formats listed in clause 5.4 where an entity internal to the NGCN site is identified.

The NGCN site may receive a connected party identity in the P-Asserted-Identity header field in a 18x or 2xx final response depending on NGN policy and the trust relationship between NGN and NGCN.

5.2.1.1.3 Privacy

If the NGCN site requires privacy for the calling party identity it will include a Privacy:id header field when sending a request to the NGN.

NOTE 1 This header field asks the NGN not to send a P-Asserted-Identity to a recipient outside its trust domain.

NOTE 2 The calling party will also put an anonymous SIP URI into the From header field if privacy is required.

The NGCN site may insert a P-Asserted-Identity header field in addition to Privacy:id if it trusts the NGN. If the NGCN site does not trust the NGN the NGCN site will not include a P-Asserted-Identity for which privacy is required.

5.2.1.1.4 Called identifier

The To header field may contain any URI format. The Request-URI has to be in a format supported by the NGN for the request to be accepted. TS 124 229 [i.12] clause 5.1.2A.1.2 gives information on the format of the Request-URI.

5.2.1.2 Incoming requests to NGCN site

5.2.1.2.1 General

The following clauses provide guidance on the common aspects of expected NGCN site behaviour when receiving a request from the NGN.

The text from clause 5.2.1.1.1 on trust also applies here.

The supported URI formats are listed in clause 5.4.

5.2.1.2.2 Calling identity

The NGCN site can receive a user provided calling identity in the From header field and an asserted calling identity in the P-Asserted-Identity header field. The P-Asserted-Identity can be accompanied by a Privacy:id header field if presentation of this identity is restricted and the NGN trusts the NGCN.

Conditions under which the NGN will send such identities depend on the availability of the information and on privacy requirements as specified in TS 182 025 [i.3] and TS 124 229 [i.12] as modified by ES 283 003 [i.15], and are also subject to an SLA between NGN and NGCN.

5.2.1.2.3 Called identity

The NGCN site may return a called party identity, which may or may not be one of the public user identities allocated to the NGCN site, in form of a P-Asserted-Identity header field in a 18x or 2xx response, as specified in TS 182 025 [i.3].

5.2.1.2.4 Request-URI

For an initial or standalone request the Request-URI will normally contain a public user identity assigned to the NGCN; an exception will be an initial call to a globally routable contact address, e.g. in the case of an emergency call-back.

NOTE For a mid-dialog request the Request-URI will contain the target URI learned from the respective Contact header field at dialog establishment time or through the most recent target refreshment.

5.2.2 SIP protocol elements

5.2.2.1 General

NOTE The status of some header fields and parameters described in this clause may not be applicable in case of private network traffic. Further study is required to identify the list of header fields that must be supported to ensure proper handling of private traffic in the IMS.

5.2.2.2 Methods

Table 5.1 provides information on the SIP methods to be supported by the NGCN site for the connection to the NGN.

It is based on tables A.5 and A.163 of TS 124 229 [i.12] as modified by ES 283 003 [i.15] and considering Business Trunking specific requirements as described in TS 182 025 [i.3].

Table 5.1 — Supported methods

Item	PDU	Sending		Receiving	
		Ref.	Profile Status	Ref.	Profile Status
1	ACK request	[i.1] 13	c2	[i.1] 13	c2
2	BYE request	[i.1] 15.1	c2	[i.1] 15.1	c2
3	BYE response	[i.1] 15.1	c2	[i.1] 15.1	c2
4	CANCEL request	[i.1] 9	m (note 3)	[i.1] 9	m (note 3)
5	CANCEL response	[i.1] 9	m (note 3)	[i.1] 9	m (note 3)
8	INVITE request	[i.1] 13	c2	[i.1] 13	c2
9	INVITE response	[i.1] 13	c2	[i.1] 13	c2
9A	MESSAGE request	[i.10]	M (note 5)	[i.10]	m (note 4)
9B	MESSAGE response	[i.10]	m (note 4)	[i.10]	m (note 5)
12	OPTIONS request	[i.5]	m	[i.5]	m
13	OPTIONS response	[i.5]	m	[i.5]	m
14	PRACK request	[i.6]	o	[i.6]	o
15	PRACK response	[i.6]	o	[i.6]	o
15A	PUBLISH request	[i.11]	o (note 2)	[i.11]	o (note 2)
15B	PUBLISH response	[i.11]	o (note 2)	[i.11]	o (note 2)
16	REFER request	[i.7]	o (note 1)	[i.7]	o (note 1)
17	REFER response	[i.7]	o (note 1)	[i.7]	o (note 1)
22	UPDATE request	[i.8]	o	[i.8]	o
23	UPDATE response	[i.8]	o	[i.8]	o
24	INFO request	[i.5]	c1	[i.5]	c1
24	INFO response	[i.5]	c1	[i.5]	c1
c1:	IF 4.1/1 THEN m ELSE o - AoC.				
c2:	IF the NGCN site supports session based services THEN m ELSE n/a.				
NOTE 1	Use of the REFER method is expected to be in conjunction with call transfer or conference, for example, when exposed at the NGCN-NGN interface.				
NOTE 2	Use of the PUBLISH method is expected to be in conjunction with presence, for example, when exposed at the NGCN-NGN interface.				
NOTE 3	TS 124 229 [i.12] mandates the support of the CANCEL request but the use of this request is linked to the use of the INVITE request which status is conditional. The status should be "c2".				
NOTE 4	TS 123 228 [i.17], clause 5.4.9.0 requires AS or S-CSCF to be able to send information to UEs using SIP based messages.				
NOTE 5	There is no mandated circumstance requiring that an NGCN site needs to send a MESSAGE request unless it supports IM or unless retargeting causes a received MESSAGE request to be redirected back to the NGN.				

According to clause 21.5.2 of [i.1] if the NGCN site receives unknown SIP method from the NGN, it answers with a 501 (Not implemented) response.

5.2.2.3 Responses

The NGCN site has to be prepared to send and receive SIP responses listed in TS 124 229 [i.12], annex A, as described in table 5.2.

Table 5.2 — Supported response codes

Item	Header	Ref.	Sending	Receiving	Comments
1	100 (Trying)	[i.1] 21.1.1	o	m	
2	180 (Ringing)	[i.1] 21.1.2	o	m	Only applicable for INVITE response.
3	181 (Call Is Being Forwarded)	[i.1] 21.1.3	o	m	Only applicable for INVITE response.
4	182 (Queued)	[i.1] 21.1.4	o	m	Only applicable for INVITE response.
5	183 (Session Progress)	[i.1] 21.1.5	o (see note)	m	Only applicable for INVITE response. The status of this header field on receiving side in TS 124 229 [i.12] is different due to a mistake. This mistake is considered to be "not essential" and is corrected in TS 124 229 Release 9 [i.84].
6	200 (OK)	[i.1] 21.2.1	m	m	
7	202 (Accepted)	[i.9] 8.3.1	c1	c1	
8	300 (Multiple Choices)	[i.1] 21.3.1	m	m	
9	301 (Moved Permanently)	[i.1] 21.3.2	m	m

45	503 (Service Unavailable)	[i.1] 21.5.4	m	m	
46	504 (Server Time-out)	[i.1] 21.5.5	m	m	
47	505 (Version not supported)	[i.1] 21.5.6	m	m	
48	513 (Message Too Large)	[i.1] 21.5.7	m	m	
49	580 (Precondition Failure)	[i.54] 8			The status of this Response Code is missing in the current specifications (TS 124 229 Release 7 [i.12], Release 8 [i.83] and Release 9 [i.84]).
50	600 (Busy Everywhere)	[i.1] 21.6.1	m	m	
51	603 (Decline)	[i.1] 21.6.2	c 12	m	
52	604 (Does Not Exist Anywhere)	[i.1] 21.6.3	m)	m	
53	606 (Not Acceptable)	[i.1] 21.6.4	m	m	
c1:	If SUBSCRIBE or REFER then m else o.				
c2:	If PUBLISH then m else n/a.				
c3:	If session-timer then m else n/a.				
c4:	If REGISTER or SUBSCRIBE then m else n/a.				
c5:	If location-conveyance then m else n/a.				
c6:	If REFER and referred-by then o else n/a.				
c7:	If REFER and referred-by then m else n/a.				
c8:	If outbound then m else n/a.				
c9:	If ACR then m else n/a.				
c10:	If SUBSCRIBE or NOTIFY then m else n/a.				
c11:	If security-agreement then m else n/a.				
c12:	If INVITE/replaces then m else o.				
NOTE	The sending of this response code is needed in case of initiating a session which requires local and/or remote resource reservation (Session Preconditions for QoS).				

5.2.2.4 Header fields

5.2.2.4.1 General

The following clauses list header fields with a specific relevance in a business trunking context. The usage of these header fields follows normal SIP rules, with some additional qualifications as described below.

5.2.2.4.2 Accept

As specified in TS 182 025 [i.3], if the agreement between the NGN and the NGCN specifies that an NGCN site receives advice of charge information, this header field indicates the support of MIME bodies of type "application/vnd.etsi.aoc+xml" defined in TS 183 047 [i.80].

5.2.2.4.3 Allow

As specified in TS 182 025 [i.3], if the agreement between the NGN and the NGCN specifies that an NGCN site receives advice of charge information, this header field indicates the support of the INFO method.

5.2.2.4.4 Contact

In an outgoing dialog initiating or target refresh request this header field contains the target URI within the NGCN (which can be different from the public user identities assigned to the NGCN site) for receiving subsequent mid-dialog requests. This URI may also be suitable for receiving future out-of-dialog requests.

In a 2xx final response to an incoming dialog initiating or target refresh request this header field contains the target URI within the NGCN (which can be different from the public user identities assigned to the NGCN site) for receiving subsequent mid-dialog requests. This URI may also be suitable for receiving future out-of-dialog requests.

5.2.2.4.5 Max-Breadth

As an NGCN site may comprise multiple SIP entities, the Max-Breadth header field can prevent loops by limiting forking within the NGCN site.

5.2.2.4.6 Max-Forwards

As an NGCN site may comprise multiple SIP entities, the Max-Forwards header field can prevent loops by limiting the number of nodes that can forward the request within the NGCN site.

5.2.2.4.7 P-Private-Network-Indication

As stated in TS 182 025 [i.3], the NGN can include a Private-Network-Indicator header field as specified in draft-vanelburg-sipping-private-network-indication [i.77] in an initial request or standalone request to the NGCN site, and the NGCN site can include this header field in an initial request or standalone request to the NGN.

5.2.2.4.8 Record-Route

As an NGCN site may comprise multiple SIP entities, this header field may be populated by entities within the NGCN site

- in a dialog initiating request sent to the NGN;
- in a response to a dialog initiating request received from the NGN.

When internally received by the NGCN attachment point, this header field has to be passed on by the attachment point and the attachment point can also add its own Record-Route header field.

5.2.2.4.9 Route

As an NGCN site may comprise multiple SIP entities, the header field may contain additional URIs addressing nodes within the NGCN site in a request received from the NGN.

NOTE The NGN may know the route set within the NGCN site from a Record-Route received earlier on the same dialog, through configuration, or from a Path header field received during registration when working in subscription mode.

5.2.2.4.10 Via

As an NGCN site may comprise multiple SIP entities, this header field may be populated by multiple entities within the NGCN site in an outgoing request to the NGN.

5.2.2.4.11 Summary of message headers

The following tables provide information on the SIP header fields to be supported by the NGCN site for the interconnection to the NGN.

As per the procedures specified in RFC 3261 [i.1], the NGCN site shall ignore received unknown SIP header fields and unknown header field parameters and continue processing the request or response where they were contained.

The tables below are based on clause A.2 of TS 124 229 [i.12] as modified by ES 283 003 [i.15] and considering Business Trunking specific requirements as described in TS 182 025 [i.3].

Table 5.3 — Supported headers within the ACK request

Item	Header	Ref.	Sending	Receiving	Content / Comment
1	Accept-Contact	[i.23] 9.2	c5	c6	
2	Allow-Events	[i.9] 7.2.2	o	m	
3	Authorization	[i.1] 20.7	c3	c3	
4	Call-ID	[i.1] 20.8	m	m	
6	Content-Disposition	[i.1] 20.11	o	m	
7	Content-Encoding	[i.1] 20.12	o	m	
8	Content-Language	[i.1] 20.13	o	m	
9	Content-Length	[i.1] 20.14	m	m	
10	Content-Type	[i.1] 20.15	m	m	
11	Cseq	[i.1] 20.16	m	m	
12	Date	[i.1] 20.17	o	m	
13	From	[i.1] 20.20	m	m	
13A	Max-Breadth	[i.53] 5.8	o	c1	
14	Max-Forwards	[i.1] 20.22	m	c2	
15	MIME-Version	[i.1] 20.24	o	m	
15A	Privacy	[i.30] 4.2	n/a	n/a	
16	Proxy-Authorization	[i.1] 20.28	c4	n/a	
17	Proxy-Require	[i.1] 20.29	o	m	According to RFC 3261 [i.1] this header field cannot be present in ACK request. TS 124 229 [i.12] is expected to be corrected in future versions.
17A	Reason	[i.31] 2	o	o	
17B	Reject-Contact	[i.23] 9.2	c5	c6	
17C	Request-Disposition	[i.23]] 9.1	c5	c6	
18	Require	[i.1] 20.32	m	m	According to RFC3261 [i.1] this header field cannot be present in ACK request. TS 124 229 [i.12] is expected to be corrected in future versions.
19	Route	[i.1] 20.34	m	c2	
20	Timestamp	[i.1] 20.38	o	m	
21	To	[i.1] 20.39	m	m	
22	User-Agent	[i.1] 20.41	o	o	
23	Via	[i.1] 20.42	m	m	

c1: IF forking is possible within the NGCN THEN m ELSE n/a.
c2: IF there are more than one SIP entity within the NGCN (including the attachment point to the NGN) THEN m ELSE n/a.
c3: IF UA-UA Authentication is used THEN m ELSE o.
c4: IF UA-Proxy Authentication is used THEN m ELSE o.
c5: IF Caller Preferences extension is supported THEN o ELSE n/a.
c6: IF Caller Preferences extension is supported THEN m ELSE n/a.

Table 5.4 — Supported headers within the BYE request

Item	Header	Ref.	Sending	Receiving	Comment
1	Accept	[i.1] 20.1	o	m	
1A	Accept-Contact	[i.23] 9.2	c7	c8 (see note)	
2	Accept-Encoding	[i.1] 20.2	o	m	
3	Accept-Language	[i.1] 20.3	o	m	
3A	Allow	[i.1] 20.5	o	m	
4	Allow-Events	[i.9] 7.2.2	o	m	
5	Authorization	[i.1] 20.7	c3	c3	
6	Call-ID	[i.1] 20.8	m	m	
7	Content-Disposition	[i.1] 20.11	o	m	
8	Content-Encoding	[i.1] 20.12	o	m	
9	Content-Language	[i.1] 20.13	o	m	
10	Content-Length	[i.1] 20.14	m	m	
11	Content-Type	[i.1] 20.15	m	m

c3:	IF the NGCN site can be deployed in an environment where it is trusted THEN m ELSE o.				

5.2.2.5 Supported Message bodies

According to TS 124 229 [i.12] SIP message body handling follows the rules of RFC 5621 [i.87]; see item 82 of table A.4 (for a UE) and item 92 of table 162 (for a proxy). These rules require that a UE supports 'multipart/mixed' and 'multipart/alternative' body types; for a proxy support is optional (dependent on whether the proxy will examine body contents).

If the NGCN supports conditions under which two or more body parts will have to be included in a single SIP message (for example SDP and location information) it has to be prepared to send and receive a 'multipart/mixed' or 'multipart/alternative' body in appropriate SIP messages.

Besides that the NGCN site is expected to support the message body types listed below:

- application/sdp: mandatory for both receiving and sending side;
- application/vnd.etsi.aoc+xml for the Advice of Charge service: as specified in clause 6.1.12 of TS 182 025 [i.3] mandatory for the receiving side if advice of charge is supported, not applicable otherwise;
- application/pidf+xml in accordance with RFC 4119 [i.78] and draft-ietf-sip-location-conveyance [i.24]:

— mandatory for the sending side if geographical location has to be sent (unless location information is sent by reference) as specified in clause 5.1.6.8 of TS 124 229 [i.12] or if NGCN has to act as a presentity (presence service);

— mandatory for the receiving side if NGCN has to act as a presence watcher or if the NGCN supports location based services.

Further body types may be allowed across the NGN-NGCN interface, e.g. under a service level agreement.

NOTE Conditions for supporting pidf+xml for basic presence services require further studies as well as the conditions for supporting multipart bodies.

5.2.2.6 Event packages

The NGCN site supported event packages are listed below:

Table 5.28 — Supported event packages

Item	Does the implementation support	Ref.	Subscriber	Notifier
2	refer package?	[i.7] 3	o	o
3	presence package?	[i.43] 6	o	o
4	eventlist with underlying presence package?	[i.44], [i.43] 6	o	o
5	presence.winfo template-package?	[i.47] 4	o	o
6	ua-profile package?	[i.48] 3	o	o
7	conference package?	[i.49] 3	o	o
8	message-summary package?	[i.50]	o	o
9	poc-settings package	[i.51]	n/a	n/a

5.2.3 SDP protocol

- For the NGCN the provisions of clause 6 of TS 124 229 [i.12] with modifications as described in ES 283 003 [i.15] and TS 182 025 [i.3], for a UE apply with the following qualifications:

- At a minimum the NGCN is expected to support SDP offer / answer exchanges as described in *draft-ietf-sipping-sip-offeranswer* [i.91].

- Reliable provisional responses and the PRACK method are optional, and neither side must depend on SDP carried in a 18x response or a PRACK message.

- If the UPDATE method is supported it can be used for SDP offer/answer exchange before and after the call has been answered.

- TS 124 229 [i.12] requires inclusion of a bandwidth parameter for audio and video media lines.

- According to TS 124 229 [i.12] an offer-answer cycle should result in a single codec per media type; if this is not the case a further offer should be issued to eliminate all codecs except the selected one.

The support of SDP extensions is detailed in table 5.29.

Table 5.29 — Major capabilities

Item	Does the implementation support capabilities within main protocol extensions	Reference	Status	Comment
22	integration of resource management and SIP?	[i.54], [i.55]	m	There is an inconsistency in TS 124 229 [i.12]: the capability is mandatory in the table but the procedures describe that the preconditions "should" be supported by a UA which makes the status optional (see clauses 5.1.3.1 and 5.1.4.1 of TS 124 229 [i.12]).
23	grouping of media lines?	[i.68]	c2	
24	mapping of media streams to resource reservation flows?	[i.69]	c3	
25	SDP bandwidth modifiers for RTCP bandwidth?	[i.70]	o (see note)	
26	TCP-based media transport in the session description protocol?	[i.71]	o	
27	interactive connectivity establishment?	[i.72]	o	
28	session description protocol format for binary floor control protocol streams?	[i.73]	o	
29	extended RTP profile for real-time transport control protocol (RTCP)-based feedback (RTP/AVPF)?	[i.74]	o	
30	SDP capability negotiation?	[i.75]	c1	
c1: IF 4.1/2 THEN m ELSE o - - multimedia telephony service c2: IF 6.30/24 THEN m ELSE o - - mapping of media streams to resource reservation flows. c3: IF there are access specific procedures as used in TS 124 229 [i.12] which the NGCN is using THEN m ELSE o.				
NOTE For "video" and "audio" media types that utilise RTP/RTCP, if the RTCP bandwidth level for the session is different than the default RTCP bandwidth as specified in RFC 3556 [i.70], then it shall be specified. For other media types, it may be specified.				

NOTE Current TS 124 229 [i.83] requirements on a UE to support SDP extensions, e.g. grouping, do not seem to imply a corresponding mandatory requirement on an NGCN site.

The following table provide information on the SDP protocol to be supported by the NGCN site for the interconnection to the NGN.

It is based on tables A.317, A.318 and A.319 of TS 124 229 [i.12] as modified by ES 283 003 [i.15] and considering Business Trunking specific requirements as described in TS 182 025 [i.3].

Table 5.30 — SDP types

Item	Type	Reference	Sending	Receiving
	Session level description			
1	v= (protocol version)	[i.76] 5.1	m	m
2	o= (owner/creator and session identifier)	[i.76] 5.2	m	m
3	s= (session name)	[i.76] 5.3	m	m
4	i= (session information)	[i.76] 5.4	o	m
5	u= (URI of description)	[i.76] 5.5	n/a	n/a
6	e= (email address)	[i.76] 5.6	n/a	n/a
7	p= (phone number)	[i.76] 5.6	n/a	n/a
8	c= (connection information)	[i.76] 5.7	m.1	m
9	b= (bandwidth information)	[i.76] 5.8	o (see note)	m
	Time description (one or more per description)			
10	t= (time the session is active)	[i.76] 5.9	m	m
11	r= (zero or more repeat times)	[i.76] 5.10	n/a	n/a
	Session level description (continued)			
12	z= (time zone adjustments)	[i.76] 5.11	n/a	n/a
13	k= (encryption key)	[i.76] 5.12	x	n/a
14	a= (zero or more session attribute lines)	[i.76] 5.13	o	m
	Media description (zero or more per description)			
15	m= (media name and transport address)	[i.76] 5.14	m	m
16	i= (media title)	[i.76] 5.4	o	m
17	c= (connection information)	[i.76] 5.7	m.1	m
18	b= (bandwidth information)	[i.76] 5.8	o (see note)	m
19	k= (encryption key)	[i.76] 5.12	x	n/a
20	a= (zero or more media attribute lines)	[i.76] 5.13	o	m
m.1:	At least one of the parameters mandatory.			
NOTE	For "video" and "audio" media types that utilise RTP/RTCP, it is specified. For other media types, it may be specified.			

5.2.4 Control plane transport

This depends on the method of interconnection; see clause 6.2.4 for the subscription-based and clause 7.2.4 for the peering-based method.

5.3 User plane interconnection

5.3.1 Media and Codec

5.3.1.1 DTMF

As specified in TS 124 229 [i.12] modified by ES 283 003 [i.15], an NGCN site shall include the MIME subtype "telephone-event" in the media description in the SDP for audio media flows that support both audio codec and DTMF payloads in RTP packets as described in RFC 4733 [i.67].

If the MIME subtype "telephone-event" is not supported by the remote party, the NGCN site should be able to send and receive DTMF in the media flow using a suitable audio codec negotiated in the offer/answer exchange.

5.3.1.2 Codecs

TS 181 005 [i.79] specifies principles for the use of codecs in the NGN. Specifically TS 181 005 [i.79] mandates that the "NGN shall allow end to end negotiation of any codec between NGN entities (terminal, network elements)". Although no direct requirement is placed on entities within the NGCN; by merit of the fact that SIP is used as the protocol for the interconnect it is clear that the NGCN-NGN interconnection interface shall allow end to end negotiation of any codec between NGCN and NGCN/NGN entities.

If the NGCN supports narrow band voice services then, as specified in TS 181 005 [i.79], in order to enable interworking for narrow band voice services for public traffic, the NGCN shall be capable of sending and receiving ITU-T Recommendation G.711 [i.89] coded speech with a packetization size of 20 ms.

5.3.1.3 Modification of media session parameters

As specified in TS 124 229 [i.12] modified by ES 283 003 [i.15], modifications of the characteristics of the media session) can be issued by the NGCN site or by the NGN by sending a re-INVITE request. The ability to support modifications of early dialogs depends on the support of the UPDATE and PRACK methods (see table 5.1).

5.4 Numbering, naming and addressing

The following URI formats in SIP messages apply at the NGCN-NGN interconnection as standardized in TS 124 229 [i.12] as modified by ES 283 003 [i.15] in order to provide business trunking services:

- SIP URI as defined in RFC 3261 [i.1], with the following qualifications:
  - The SIP URI can be either based on an E.164 number or a private number or it can be an e-mail style SIP URI, including device identifiers such as GRUUs.
  - Dial strings are not present on the NGCN-NGN interface.
  - As specified in [i.1], the ";user=phone" parameter is present in SIP URIs in which the user part is a telephone-subscriber string.
  - As specified in [i.1], the ";user=phone" parameter is not present in SIP URIs in which the user part is not a telephone-subscriber string in compliance with the tel URI definition of RFC 3966 [i.18]. According to this requirement, the phone-context parameter is mandatory when the user part of a SIP URI with a ";user=phone" parameter is not a global number.
- Tel URI defined in RFC 3966 [i.18] and according to the requirements defined in ECMA TR/96 [i.22]:
  - In accordance with RFC 3966 [i.18], the phone-context parameter is mandatory when the tel URI contains a private number.

In addition, the following URI formats in SIP Request-URIs may be applied at the NGCN-NGN interconnection as standardized in TS 124 229 [i.12] as modified by ES 283 003 [i.15] for the support of presence and instant messaging:

- IM URI defined in RFC 3860 [i.19];
- PRES URI defined in RFC 3859 [i.20].

Other URI formats may also be supported over the NGCN-NGN interconnection depending on the NGN operator and its customer agreements.

NOTE The NGN behaviour in case of URIs that do not comply with the specified formats is outside the scope of the present document.

5.5 IP Version

The network elements interconnected on the NGCN-NGN Interconnection may support IPv4 only, IPv6 only or both.

The support of one or both of the IP versions is an option and should be based on bilateral agreement.

The control plane and the user plane may use different IP addresses and different IP versions.

In case IPv4 and IPv6 networks are interconnected, as specified in TS 124 229 [i.12], annex G as modified by ES 283 003 [i.15] and TS 183 021 [i.21], the involved P-CSCF shall apply the IP version interworking procedures for NA(P)-T-PT.

5.6 Security

5.6.1 Authentication

The authentication mechanism used on the NGCN-NGN interconnection should be part of the Service Level Agreement (SLA) between the operator and the enterprise.

It is expected that different mechanisms will apply for the two methods of interconnection; see clause 6.6.1 for the subscription based approach and clause 7.6.1 for the peering-based method.

6 Specific guidelines for the subscription based approach

6.1 Reference model for interconnection

6.1.1 General

The architectural split of the service layer and transport layer (used in the description below) is defined in ES 282 001 [i.16].

Clause 5.2 of TS 182 025 [i.3] describes the architectural requirements for the connection of an Next Generation Corporate Network site (NGCN site) to the NGN using the P-CSCF as an entry point at the service layer.

Clause 8.3 of TS 182 023 [i.4] shows the arrangement of the involved functional entities.

6.1.2 Functionalities performed by entities at the service layer

6.1.2.1 P-CSCF, S-CSCF

According to TS 182 025 [i.3], for the subscription based scenario the P-CSCF is the first contact point for the NGCN site within the IM subsystem (IMS). The NGCN site attaches to the P-CSCF at the Gm reference point.

The S-CSCF provides home server functions for the NGCN site, making use of the UPSF as necessary.

Further definition of the P-CSCF and S-CSCF is provided in TS 123 228 [i.17] as modified by ES 282 007 [i.42].

6.1.2.2 AS

Business trunking may involve a dedicated application server that provides business trunking specific capabilities and may need to access the UPSF for that purpose.

NOTE If P-CSCF and S-CSCF together provide all business trunking related functions then no AS is needed.

6.1.2.3 NGCN

The NGCN site appears to the NGN like a UE attached to the P-CSCF at the Gm reference point.

6.1.3 Functionalities performed by entities at the transport layer

6.1.3.1 C-BGF

According to TS 182 025 [i.3], the main functional entity that is used at the transport layer to realise subscription-based business trunking and that is involved on the NGN-NGCN interface is the Core Border Gateway Function (C-BGF).

The C-BGF sits at the boundary between an access network and a core network and provides the interface between two IP-transport domains. Further definition of the C-BGF is provided in ES 282 001 [i.16].

6.1.4 Connectivity Access Network

As described in TS 182 025 [i.3], NGCN sites may be connected to any IP-CAN valid for TISPAN NGN. The present document assumes the following types of IP-CANs: xDSL and Ethernet LAN although it may be applicable to other types of IP-CANs.

Clause 9.2.1 of TS 124 229 [i.12] as modified by ES 283 003 [i.15] and TS 182 025 [i.3], clause 7.1.1 specify methods for getting a P-CSCF SIP server domain name or IP address:

- P-CSCF SIP server domain name or IP address is received from the NASS (i.e. the NACF representing a DHCP server). In this case the P-CSCF address/port are found in DHCP Option 120 (for xDSL access).
- P-CSCF address provisioned through an O&M interface.
- P-CSCF SIP server domain name or IP address received using the TR-69 [i.95] CWMP. In this case the P-CSCF address/port are found in the ProxyServer (ProxyServerPort) field or the OuboundProxy (OutboundProxyPort) field defined in TR-104 [i.96].

Additionally, clause 9.2.1. and related access technology specific annexes of TS 124 229 [i.12] as modified by ES 283 003 [i.15] specify methods of obtaining the P-CSCF address for all access technologies.

6.2 Control plane interconnection

6.2.1 SIP procedures

6.2.1.1 Outgoing requests from NGCN site

6.2.1.1.1 General

Procedures for outgoing requests are specified in TS 182 025 [i.3], clause 6.1.4. The following clauses provide further guidance on the expected NGCN site behaviour for the subscription based case in addition to clause 5.2.1.1.

6.2.1.1.2 Calling and connected identifiers

Clause 5.2.1.1.2 applies with the addition that a calling party identity may be sent in a P-Preferred-Identity instead of a P-Asserted-Identity header field in accordance with RFC 3325 [i.29].

NOTE If the NGN does not trust the NGCN site it will generate its own P-Asserted-Identity header field, which may take an NGCN-provided P-Asserted-Identity or P-Preferred-Identity into account or may be a default identity for the NGCN site. NGN will use a provided PAI or PPI if that matches one of the registered public user identities.

6.2.1.1.3 Privacy

See clause 5.2.1.1.3.

In addition, a Privacy:id header field can also accompany a P-Preferred-Identity header field sent by the NGCN site.

6.2.1.1.4 Called identifier

See clause 5.2.1.1.4.

6.2.1.1.5 SDP offer

NOTE TS 124 229 [i.12] currently requires a UE to include an SDP offer when submitting an INVITE request. There is an issue with subscription-based business trunking if in certain situations the NGCN site is unable to include an SDP offer in the INVITE request.

6.2.1.2 Incoming requests to NGCN site

6.2.1.2.1 General

Procedures for incoming requests are specified in TS 182 025 [i.3], clause 6.1.5. The following clauses provide further guidance on the expected NGCN site behaviour for the subscription based case in addition to 5.2.1.2.

6.2.1.2.2 Calling identity

See clause 5.2.1.2.2.

6.2.1.2.3 Called identity

See clause 5.2.1.2.3.

6.2.1.2.4 Request-URI

As specified in TS 182 025 [i.3], if a loose-route indicator is configured for the NGCN site the Request-URI of a SIP request received from the NGN will convey the actual destination inside the NGCN (as specified in clause 5.2.1.2.4), and the Route header field will contain the registered contact of the NGCN site.

If no loose-route indicator is configured in the NGCN site profile the Request-URI of a SIP request received from the NGN will contain the registered contact of the NGCN site, and the public user identity of the actual destination inside the NGCN is conveyed in the P-Called-Party-ID header field.

NOTE The non-loose-route procedure may not be adequate for NGCN URIs that are not assigned public user identities, e.g. private GRUUs. This issue requires further study.

6.2.1.3 Registration

In the subscription based mode the NGCN site will register to the NGN as described in TS 182 025 [i.3] clause 6.1.3, using a public user identity and a private user identity that represent the NGCN site as a whole. As specified in TS 124 229 [i.12] with modifications as described in ES 283 003 [i.15] for UE's, the NGCN site includes a Supported:path header field in the REGISTER request.

When using SIP Digest, in addition to the procedures specified in RFC3261, the initial REGISTER includes an Authorization header field with the private user identity, as specified in TS 124 229 [i.12] clause 5.1.

NOTE 1 This procedure implicitly registers all other public user identities assigned to the NGCN site as individual or wildcarded identities.

NOTE 2 If provisioned in the user profile associated with the NGCN site the loose route indication will be stored by the S-CSCF at registration time.

If present in the REGISTER response the P-Associated-URI header field contains the set of implicitly registered identities.

Successful registration will result in an association between the NGCN site and the P-CSCF used for registration, based on mutual authentication between NGCN site and S-CSCF. The NGCN should be prepared to receive signalling traffic from the NGN over this association and in turn is expected to use this association when sending signalling messages to the NGN. An association may be a security association, a TLS session or a relationship between public user identity and port number (see clause 6.6.1).

As specified in TS 124 229 [i.12] with modifications as described in ES 283 003 [i.15] for UE's, the NGCN site subscribes to the reg-event package in order to get notified of status changes regarding its registration (refer to clause 4.4.2.4).

6.2.2 SIP protocol elements

6.2.2.1 General

See clause 5.2.2.1.

6.2.2.2 Methods

In addition to table 5.1, the methods listed in table 6.1 apply in the context of the subscription based scenario.

Table 6.1 — Additional supported methods for subscription based scenario

Item	PDU	Sending		Receiving	
		Ref.	Profile Status	Ref.	Profile Status
10	NOTIFY request	[i.9]	o	[i.9]	m (see note)
11	NOTIFY response	[i.9]	m (see note)	[i.9]	o
18	REGISTER request	[i.1] 10	m	[i.1] 10	x
19	REGISTER response	[i.1] 10	x	[i.1] 10	m
20	SUBSCRIBE request	[i.9]	m (see note)	[i.9]	o
21	SUBSCRIBE response	[i.9]	o	[i.9]	m (see note)
NOTE	See clause 4.4.2.4 (reg-event package).				

6.2.2.3 Responses

See clause 5.2.2.3.

6.2.2.4 Header fields

In addition to clause 5.2.2.4, the following header fields apply for the following methods.

Table 6.2 — Void

Table 6.3 — Supported headers within the BYE request

Item	Header	Ref.	Sending	Receiving	Comment
21A	Security-Client	[i.32] 2.3.1	c2	n/a	
21B	Security-Verify	[i.32] 2.3.1	c3	n/a	
c2:	IF IMS AKA plus IPsec ESP or SIP Digest with TLS is used for authentication THEN o ELSE n/a				
c3:	IF IMS AKA plus IPsec ESP or SIP Digest with TLS is used for authentication THEN m ELSE n/a				

Table 6.4 — Void

Table 6.5 — Void

Table 6.6 — Void

Table 6.7 — Supported headers within the INFO request

Item	Header	Ref.	Sending	Receiving	Comment
22	P-Access-Network-Info	[i.28] 4.4	c15	n/a

6.2.2.5 Supported message bodies

See clause 5.2.2.5.

6.2.2.6 Event packages

In addition to clause 5.2.2.6 the event packages in the following table apply:

Table 6.29— Supported event packages

Item	Does the implementation support	Ref.	Subscriber	Notifier
1	reg event package?	[i.45]	M (see note)	n/a
1A	reg event package extension for GRUUs?	[i.46]	o	n/a
NOTE See clause 4.4.2.4.				

6.2.3 SDP protocol

See clause 5.2.3.

6.2.4 Control plane transport

The control plane transport of the NGCN-NGN Interconnection interface in the subscription based approach complies with the provisions in clause 4.2A of TS 124 229 [i.12] as modified by ES 283 003 [i.15] applicable to a UE and a P-CSCF with modifications as described in the following clauses.

A security gateway may exist with IPv4 and IPv6 interfaces between the NGCN and the NGN.

NOTE Need statement concerning behaviour when two SIP entities within an NGCN site are both capable of registering through the P-CSCF, either on a cold or hot standby basis or on a load sharing basis.

6.2.4.1 Keep alive mechanism

ES 283 003 [i.15] provides two solutions to keep a connection alive, depending on the NAT traversal mechanism (Latching-based as defined in TS 124 229 [i.12], annex F or SIP Outbound-based as defined in annex K) used.

When using the latching-based NAT traversal mechanism, as defined in TS 124 229 [i.12], annex F as modified by ES 283 003 [i.15], clause F.4.2 provides two solutions for keeping the signalling connection alive:

- short registration timers (see note 1 in ES 283 003 [i.15], clause F.4.2); and
- SIP outbound keep-alive as a stand-alone mechanism (see note 2 in ES 283 003 [i.15], clause F.4.2).

When using SIP outbound, as specified in TS 124 229 [i.12], annex K, the SIP-outbound keep-alive mechanism applies.

NOTE Use of alternative mechanisms (e.g. OPTIONS method) is outside the scope of the present document.

6.2.4.2 P-CSCF redundancy

Clause 6.1.4 describes several methods enabling an NGCN site to obtain the IP address or the SIP server domain name of the P-CSCF. If a SIP server domain name of the P-CSCF is obtained, RFC 3263 [i.86] procedures as specified in TS 124 229 [i.12], clause E.2.2.1 can be applied to obtain from the DNS the IP address of the P-CSCF, including backup addresses for use in case of failure of the preferred choice.

NOTE 1 3GPP TR 23.812 [i.94] may provide solutions for including load status information in the DNS (e.g. setting the weight field in SRV records based on the actual server load). However this will not affect the NGCN-NGN interface but rather the DNS behaviour.

NOTE 2 Business Trunking specific redundancy mechanisms are for further study in TS 182 025 (Release 2) [i.3].

6.3 User plane interconnection

6.3.1 Media and Codec

6.3.1.1 DTMF

See clause 5.3.1.1.

6.3.1.2 Codecs

See clause 5.3.1.2.

6.3.1.3 Modification of media session parameters

See clause 5.3.1.3.

6.4 Numbering, naming and addressing

See clause 5.4.

6.5 IP Version

See clause 5.5.

6.6 Security

6.6.1 Authentication

The NGCN site can connect to the NGN using one of the following authentication mechanisms between NGN and NGCN site as specified in TS 124 229 [i.12], clause 5.1.1.5:

- IMS AKA with IPSec;
- SIP digest over TLS;
- SIP digest without TLS.

NOTE When SIP Digest is used without TLS, the NGCN site may need to provide authentication credentials in all requests, as specified in TS 133 203 [i.52] annex N, unless a check on the source address/port of the messages sent by the NGCN site is considered sufficiently secure by the NGN.

Which of these authentication mechanisms are applicable is part of an SLA between NGN and NGCN.

An NGCN has to support at least one of the above mechanisms and should allow configuration of the authentication mechanism to be used if it supports more than one. For the mechanisms TLS and IMS AKA support of the security agreement extension of SIP is mandatory.

Irrespective of the mechanism used, the NGCN site is authenticated as a whole as part of the registration process. If TLS or IMS AKA is in use, non-REGISTER requests from the NGCN are implicitly authenticated by being sent within the security context established between NGN and NGCN during registration, but non-REGISTER requests may be challenged by the NGN if SIP Digest without TLS is in use. Individual NGCN entities beyond the NGCN attachment point are never subject to being challenged by the NGN.

In addition, if allowed by the SLA, implicit authentication may also be used. This does not require any specific action from the NGCN site and relies on the NASS bundled authentication procedure at the NGN side.

NOTE The authentication mechanism discussed above is different from NGCN-internal authentication mechanisms between entities inside the NGCN; refer to draft ECMA-TR/100 [i.88] for more information. NGCN-specific authentication information may traverse the NGN if exchanged between NGCN sites connected by the NGN.

7 Specific guidelines for the peering-based approach

7.1 Reference model for interconnection

7.1.1 General

7.1.2 Functionalities performed by entities at the service layer

7.1.2.1 Interconnection Border Control Function (IBCF)

According to TS 182 025 [i.3], for the peering based scenario the IBCF is the contact point for the NGCN site within the IM subsystem (IMS). The NGCN site attaches to the IBCF at the Ic reference point.

Further definition of the IBCF is provided in TS 123 228 [i.17] as modified by ES 282 007 [i.42].

7.1.2.2 NGCN

The NGCN site appears to the NGN like an IBCF attached to the (NGN's) IBCF at the Ic reference point.

7.2 Control plane interconnection

7.2.1 SIP procedures

7.2.1.1 Outgoing requests from NGCN site

Procedures for outgoing requests are specified in TS 182 025 [i.3], clause 6.2.4 for the peering based case. The peering based scenario has no further requirements in addition to 5.2.1.1.

NOTE If the NGN does not trust the NGCN site it will remove a P-Asserted-Identity header field provided by the NGCN site, i.e. the message will proceed without a P-Asserted-Identity.

7.2.1.2 Incoming requests to NGCN site

Procedures for incoming requests are specified in TS 182 025 [i.3], clause 6.2.5 for the peering based case. The peering based scenario has no further requirements in addition to 5.2.1.2.

7.2.1.3 Registration

Not applicable.

7.2.2 SIP protocol elements

7.2.2.1 General

7.2.2.2 Methods

See clause 5.2.2.2.

In addition to table 5.1, the methods listed in table 7.1 apply in the context of the peering based scenario.

Table 7.1 — Supported methods

Item	PDU	Sending		Receiving	
		Ref.	Profile Status	Ref.	Profile Status
10	NOTIFY request	[i.9]	o	[i.9]	o
11	NOTIFY response	[i.9]	o	[i.9]	o
20	SUBSCRIBE request	[i.9]	o	[i.9]	o
21	SUBSCRIBE response	[i.9]	o	[i.9]	o

7.2.2.3 Responses

See clause 5.2.2.3.

7.2.2.4 Header fields

In addition to 5.2.2.4, the following header fields apply for the following methods.

Table 7.2 — Void

Table 7.3 — Supported headers within the BYE request

Item	Header	Ref.	Sending	Receiving	Comment
21A	Security-Client	[i.32] 2.3.1	n/a	n/a	
21B	Security-Verify	[i.32] 2.3.1	n/a	n/a	

Table 7.4 — Void

Table 7.5 — Void

Table 7.6 — Void

Table 7.7 — Supported headers within the INFO request (peering based approach)

Item	Header	Ref.	Sending	Receiving	Comment
22	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	
37	Security-Client	[i.32] 2.3.1	n/a	n/a	
38	Security-Verify	[i.32] 2.3.1	n/a	n/a	

Table 7.8 — Supported headers within the 200 OK response to the INFO request

Item	Header	Ref.	Sending	Receiving	Comment
21	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	

Table 7.9 — Supported headers within the INVITE request

Item	Header	Ref.	Sending	Receiving	Comment
24A	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	
24C	P-Asserted-Service	[i.34] 4.1	n/a	n/a	
24D	P-Called-Party-ID	[i.28] 4.2	x	n/a	
25	P-Media-Authorization	[i.37] 5.1	n/a	n/a	
25A	P-Preferred-Identity	[i.29] 9.2	n/a	n/a	
25B	P-Preferred-Service	[i.34] 4.2	n/a	n/a	
33A	Security-Client	[i.32] 2.3.1	n/a	n/a	
33B	Security-Verify	[i.32] 2.3.1	n/a	n/a	
NOTE	The use of this header is subject to Spec T.				

Table 7.10 — Supported headers within the 200 OK response to the INVITE request

Item	Header	Ref.	Sending	Receiving	Comment
23	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	
27	P-Media-Authorization	[i.37] 5.1	x	n/a	

Table 7.11 — Supported headers within the MESSAGE request

Item	Header	Ref.	Sending	Receiving	Comment
18A	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	
18C	P-Asserted-Service	[i.34] 4.1	n/a	n/a	
18D	P-Called-Party-ID	[i.28] 4.2	x	n/a	
18G	P-Preferred-Identity	[i.29] 9.2	n/a	n/a	
18H	P-Preferred-Service	[i.34] 4.2	n/a	n/a	
25A	Security-Client	[i.32] 2.3.1	n/a	n/a	
25B	Security-Verify	[i.32] 2.3.1	n/a	n/a	

Table 7.12 — Supported headers within the 2xx response to the MESSAGE request

Item	Header	Ref.	Sending	Receiving	Comment
12A	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	

Table 7.13 — Supported headers within the NOTIFY request

Item	Header	Ref.	Sending	Receiving	Comment
17A	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	
22A	Security-Client	[i.32] 2.3.1	n/a	n/a	
22B	Security-Verify	[i.32] 2.3.1	n/a	n/a	

Table 7.14 — Supported headers within the 200 OK response to NOTIFY

Item	Header	Ref.	Sending	Receiving	Comment
1	P-Access-Network-Info	[i.28] 4.4	n/a	n/a	

Table 7.15 — Supported headers within the OPTIONS request

Item	Header	Ref.	Sending	Receiving	Comment
19C	P-Asserted-Service	[i.34] 4.1	n/a	n/a	
19D	P-Called-Party-ID	[i.28] 4.2	x	n/a	
19H	P-Preferred-Service	[i.34] 4.2	n/a	n/a	
24A	Security-Client	[i.32] 2.3.1	n/a	n/a	
24B	Security-Verify	[i.32] 2.3.1	n/a	n/a	
25	Supported	[i.1] 20.37	o	m	
NOTE The use of this header is subject to Spec T.					

Table 7.16 — Supported headers within the 200 OK response to the OPTIONS request
