## Summary

Used to declaratively specify security actions to control access to files and directories.

**Inherits From:** System.Security.Permissions.CodeAccessSecurityAttribute

**Library:** BCL

**Thread Safety:** All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

## Description

[Note: The level of access to a file or directory is specified using the members of the current instance. For example, to specify read permissions for a file, set the **System.Security.Permissions.FileIOPermissionAttribute.Read** property equal to the name of the file.

The security information declared by a security attribute is stored in

1 the metadata of the attribute target, and is accessed by the system at  
2 run-time. Security attributes are used for declarative security only. For  
3 imperative security, use the corresponding permission class,  
4 **System.Security.Permissions.FileIOPermission**.  
5  
6 The allowable  
7 **System.Security.Permissions.FileIOPermissionAttribute** targets  
8 are determined by the  
9 **System.Security.Permissions.SecurityAction** passed to the  
10 constructor.] Case-sensitivity of file and directory names is platform  
11 dependent. The set of characters that are valid for use in file and  
12 directory names is determined by the current file system.

### 13 **Example** 14

15 The following example shows a declarative request for full access to  
16 the specified file. The  
17 **System.Security.Permissions.SecurityAction.RequestMinimum**  
18 security action indicates that this is the minimum permission required  
19 for the target assembly to be able to execute.

```
20  
21 [assembly:FileIOPermissionAttribute(SecurityAction.RequestM  
22 inimum, All="\\example\\sample.txt")]
```

23  
24 The following example shows how to demand that the calling code has  
25 unrestricted access to files and directories. Demands are typically  
26 made to protect methods or classes from malicious code.

```
27  
28 [FileIOPermissionAttribute(SecurityAction.Demand,  
29 Unrestricted=true)]
```

30

# 1 FileIOPermissionAttribute(System.Security.Permissions.SecurityAction) Constructor

```
3 [ILASM]  
4 public rtspecialname specialname instance void  
5 .ctor(valuetype System.Security.Permissions.SecurityAction  
6 action)  
  
7 [C#]  
8 public FileIOPermissionAttribute(SecurityAction action)
```

## 9 Summary

10 Constructs and initializes a new instance of the  
11 **System.Security.Permissions.FileIOPermissionAttribute** class  
12 with the specified **System.Security.Permissions.SecurityAction**  
13 value.

## 14 Parameters

Parameter	Description
<i>action</i>	A <b>System.Security.Permissions.SecurityAction</b> value.

## 17 Exceptions

Exception	Condition
<b>System.ArgumentException</b>	<i>action</i> is not a valid <b>System.Security.Permissions.SecurityAction</b> value.

# 1 FileIOPermissionAttribute.CreatePermissi 2 on() Method

```
3 [ILASM]  
4 .method public hidebysig virtual class  
5 System.Security.IPermission CreatePermission()  
  
6 [C#]  
7 public override IPermission CreatePermission()
```

## 8 Summary

9 Returns a new **System.Security.Permissions.FileIOPermission**  
10 that contains the security information of the current instance.

## 11 Return Value

12

13 A new **System.Security.Permissions.FileIOPermission** object with  
14 the security information of the current instance.

## 15 Description

16 [Note: Applications typically do not call this method; it is intended for  
17 use by the system.]

18

19 The security information declared by a security attribute is stored in  
20 the metadata of the attribute target, and is accessed by the system at  
21 run-time. The system uses the object returned by this method to  
22 convert the security information of the current instance into the form  
23 stored in metadata.

24

25 This method overrides

26 **System.Security.Permissions.SecurityAttribute.CreatePermissio**  
27 **n.**]

28

# 1 FileIOPermissionAttribute.All Property

```
2 [ILASM]  
3 .property string All { public hidebysig specialname  
4 instance void set_All(string value) }  
  
5 [C#]  
6 public string All { set; }
```

## 7 Summary

8 Sets the name of a file or directory for which full access is secured.

## 9 Property Value

10

11 A **System.String** containing the absolute path of the file or directory  
12 for which full access is secured.

## 13 Description

14 This property is write-only.

15

16 [*Note:* This property sets full access for a single file or directory; use  
17 additional

18 **System.Security.Permissions.FileIOPermissionAttribute**  
19 attributes to specify additional files and directories.]

## 20 Exceptions

21

22

Exception	Condition
<b>System.ArgumentException</b>	The path information specified for a set operation contains invalid characters or wild card specifiers.

23

24

25

# 1 FileIOPermissionAttribute.Append 2 Property

```
3 [ILASM]  
4 .property string Append { public hidebysig specialname  
5 instance string get_Append() public hidebysig specialname  
6 instance void set_Append(string value) }  
  
7 [C#]  
8 public string Append { get; set; }
```

## 9 Summary

10 Gets or sets the name of a file or directory for which append access is  
11 secured.

## 12 Property Value

13  
14 A **System.String** containing the absolute path of the file or directory  
15 for which append access is secured.

## 16 Description

17 [Note: This property sets append access for a single file or directory;  
18 use additional  
19 **System.Security.Permissions.FileIOPermissionAttribute**  
20 attributes to specify additional files and directories.]

## 21 Exceptions

22  
23

Exception	Condition
<b>System.ArgumentException</b>	The path information specified for a set operation contains invalid characters or wild card specifiers.

24  
25  
26

# 1 FileIOPermissionAttribute.PathDiscovery 2 Property

```
3 [ILASM]  
4 .property string PathDiscovery { public hidebysig  
5 specialname instance string get_PathDiscovery() public  
6 hidebysig specialname instance void  
7 set_PathDiscovery(string value) }  
  
8 [C#]  
9 public string PathDiscovery { get; set; }
```

## 10 Summary

11 Gets or sets the name of a file or directory for which path discovery  
12 access is secured.

## 13 Property Value

15 A **System.String** containing the absolute path of the file or directory  
16 for which access to the contents of the path is secured.

## 17 Description

18 [Note: This property sets path discovery access for a single file or  
19 directory; use additional  
20 **System.Security.Permissions.FileIOPermissionAttribute**  
21 attributes to specify additional files and directories.  
22

23 Path discovery controls access to the information in the path itself.  
24 This protects sensitive information in the path, such as user names, as  
25 well as information about the directory structure revealed in the path.  
26 This value does not secure access to files or folders represented by the  
27 path.]

## 28 Exceptions

29  
30

Exception	Condition
<b>System.ArgumentException</b>	The path information specified for a set operation contains invalid characters or wild card specifiers.

31  
32  
33

# 1 FileIOPermissionAttribute.Read Property

```
2 [ILASM]
3 .property string Read { public hidebysig specialname
4 instance string get_Read() public hidebysig specialname
5 instance void set_Read(string value) }
6
7 [C#]
8 public string Read { get; set; }
```

## 8 Summary

9 Gets or sets the name of a file or directory for which read access is  
10 secured.

## 11 Property Value

12

13 A **System.String** containing the absolute path of the file or directory  
14 for which read access is secured.

## 15 Description

16 [Note: This property sets read access for a single file or directory; use  
17 additional  
18 **System.Security.Permissions.FileIOPermissionAttribute**  
19 attributes to specify additional files and directories.]

## 20 Exceptions

21

22

Exception	Condition
<b>System.ArgumentException</b>	The path information specified for a set operation contains invalid characters or wild card specifiers.

23

24

25

# 1 FileIOPermissionAttribute.Write Property

```
2 [ILASM]
3 .property string Write { public hidebysig specialname
4 instance string get_Write() public hidebysig specialname
5 instance void set_Write(string value) }
6
7 [C#]
8 public string Write { get; set; }
```

## 8 Summary

9 Gets or sets the name of a file or directory for which write access is  
10 secured.

## 11 Property Value

12

13 A **System.String** containing the absolute path of the file or directory  
14 for which write access is secured.

## 15 Description

16 [Note: This property sets write access for a single file or directory; use  
17 additional  
18 **System.Security.Permissions.FileIOPermissionAttribute**  
19 attributes to specify additional files and directories.]

## 20 Exceptions

21

22

Exception	Condition
<b>System.ArgumentException</b>	The path information specified for a set operation contains invalid characters or wild card specifiers.
