

# System.Security.Permissions.EnvironmentPermissionAttribute Class

```
[ILASM]
.class public sealed serializable
EnvironmentPermissionAttribute extends
System.Security.Permissions.CodeAccessSecurityAttribute

[C#]
public sealed class EnvironmentPermissionAttribute :
CodeAccessSecurityAttribute
```

## Assembly Info:

- *Name:* mscorlib
- *Public Key:* [00 00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- *Version:* 1.0.x.x
- *Attributes:*
  - CLSCompliantAttribute(true)

## Type Attributes:

- AttributeUsageAttribute(AttributeTargets.Assembly | AttributeTargets.Class | AttributeTargets.Struct | AttributeTargets.Constructor | AttributeTargets.Method, AllowMultiple=true, Inherited=false)

## Summary

Used to declaratively specify security actions to control access to environment variables.

**Inherits From:** System.Security.Permissions.CodeAccessSecurityAttribute

**Library:** BCL

**Thread Safety:** All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

## Description

Environment variable names are case-insensitive. Multiple environment variable names are specified by separating the names using the **System.IO.Path.PathSeparator** string.

[*Note:* The level of access to one or more environment variables is specified using the members of the current instance. For example, to specify read permissions for an environment variable, set the

1       **System.Security.Permissions.EnvironmentPermissionAttribute.**  
2       **Read** property equal to the name of the environment variable.

3  
4       The security information declared by a security attribute is stored in  
5       the metadata of the attribute target, and is accessed by the system at  
6       run-time. Security attributes are used for declarative security only. For  
7       imperative security, use the corresponding permission class,  
8       **System.Security.Permissions.EnvironmentPermission.**

9  
10       The allowable  
11       **System.Security.Permissions.EnvironmentPermissionAttribute**  
12       targets are determined by the  
13       **System.Security.Permissions.SecurityAction** passed to the  
14       constructor.]

### 15   **Example** 16

17       The following example shows a declarative request for the ability to  
18       read the specified environment variables. The  
19       **System.Security.Permissions.SecurityAction.RequestMinimum**  
20       security action indicates that this is the minimum permission required  
21       for the target assembly to be able to execute.

```
22  
23       [assembly:EnvironmentPermissionAttribute(SecurityAction.RequestMinimum, Read="COMPUTERNAME;USERNAME;USERDOMAIN")]
```

25  
26       The following example shows how to demand that the calling code has  
27       unrestricted access to all environment variables. Demands are typically  
28       made in managed libraries to protect methods or classes from  
29       malicious code.

```
30  
31       [EnvironmentPermissionAttribute(SecurityAction.Demand,  
32       Unrestricted=true)]
```

33

# EnvironmentPermissionAttribute(System. Security.Permissions.SecurityAction) Constructor

```
[ILASM]  
public rtspecialname specialname instance void  
.ctor(valuetype System.Security.Permissions.SecurityAction  
action)  
  
[C#]  
public EnvironmentPermissionAttribute(SecurityAction  
action)
```

## Summary

Constructs and initializes a new instance of the **System.Security.Permissions.EnvironmentPermissionAttribute** class with the specified **System.Security.Permissions.SecurityAction** value.

## Parameters

Parameter	Description
<i>action</i>	A <b>System.Security.Permissions.SecurityAction</b> value.

## Exceptions

Exception	Condition
<b>System.ArgumentException</b>	<i>action</i> is not a valid <b>System.Security.Permissions.SecurityAction</b> value.

23  
24  
25

# 1 EnvironmentPermissionAttribute.CreatePer 2 mission() Method

```
3 [ILASM]  
4 .method public hidebysig virtual class  
5 System.Security.IPermission CreatePermission()  
  
6 [C#]  
7 public override IPermission CreatePermission()
```

## 8 Summary

9 Returns a new  
10 **System.Security.Permissions.EnvironmentPermission** that  
11 contains the security information of the current instance.

## 12 Return Value

13

14 A new **System.Security.Permissions.EnvironmentPermission**  
15 object with the security information of the current instance.

## 16 Description

17 [*Note:* Applications typically do not call this method; it is intended for  
18 use by the system.]

19

20 The security information described by a security attribute is stored in  
21 the metadata of the attribute target, and is accessed by the system at  
22 run-time. The system uses the object returned by this method to  
23 convert the security information of the current instance into the form  
24 stored in metadata.

25

26 This method overrides  
27 **System.Security.Permissions.SecurityAttribute.CreatePermissio  
28 n.**]

29

# 1 EnvironmentPermissionAttribute.All

## 2 Property

```
3 [ILASM]  
4 .property string All { public hidebysig specialname  
5 instance void set_All(string value) }  
  
6 [C#]  
7 public string All { set; }
```

### 8 Summary

9 Sets the environment variables for which full access is secured.

### 10 Property Value

11

12 A **System.String** containing one or more environment variables for  
13 which full access is secured.

### 14 Description

15 This property is write-only.

16

17 Multiple environment variable names are specified by separating the  
18 names using the **System.IO.Path.PathSeparator** string.  
19 Environment variable names are case-insensitive.

20

21 [Note: The security action passed to the constructor of the current  
22 instance determines how the specified environment variables are  
23 secured. For example, if the action is  
24 **System.Security.Permissions.SecurityAction.RequestMinimum**,  
25 then the target of the current instance requires full access to the  
26 specified variables in order to execute. If the action is  
27 **System.Security.Permissions.SecurityAction.RequestRefuse**,  
28 then the system does not allow the target any access to the specified  
29 variables.]

30

# 1 EnvironmentPermissionAttribute.Read 2 Property

```
3 [ILASM]  
4 .property string Read { public hidebysig specialname  
5 instance string get_Read() public hidebysig specialname  
6 instance void set_Read(string value) }  
  
7 [C#]  
8 public string Read { get; set; }
```

## 9 Summary

10 Gets or sets the environment variables for which read access is  
11 secured.

## 12 Property Value

13

14 A **System.String** containing one or more environment variables for  
15 which read access is secured.

## 16 Description

17 Multiple environment variable names are specified by separating the  
18 names using the **System.IO.Path.PathSeparator** string.  
19 Environment variable names are case-insensitive.

20

21 [*Note:* The security action passed to the constructor of the current  
22 instance determines how the specified environment variables are  
23 secured. For example, if the action is  
24 **System.Security.Permissions.SecurityAction.RequestMinimum**,  
25 then the target of the current instance requires read access to the  
26 specified variables in order to execute. If the action is  
27 **System.Security.Permissions.SecurityAction.RequestRefuse**,  
28 then the system does not allow the target to read the specified  
29 variables.]

30

# 1 EnvironmentPermissionAttribute.Write 2 Property

```
3 [ILASM]  
4 .property string Write { public hidebysig specialname  
5 instance string get_Write() public hidebysig specialname  
6 instance void set_Write(string value) }  
  
7 [C#]  
8 public string Write { get; set; }
```

## 9 Summary

10 Gets or sets the environment variables for which write access is  
11 secured.

## 12 Property Value

13

14 A **System.String** containing one or more environment variables for  
15 which write access is secured.

## 16 Description

17 Multiple environment variable names are specified by separating the  
18 names using the **System.IO.Path.PathSeparator** string.  
19 Environment variable names are case-insensitive.

20

21 [*Note:* The security action passed to the constructor of the current  
22 instance determines how the specified environment variables are  
23 secured. For example, if the action is  
24 **System.Security.Permissions.SecurityAction.RequestMinimum**,  
25 then the target of the current instance requires write access to the  
26 specified variables in order to execute. If the action is  
27 **System.Security.Permissions.SecurityAction.RequestRefuse**,  
28 then the system does not allow the target to write the specified  
29 variables.]
