

1 System.Threading.ThreadAbortException

2 Class

```
3  
4  
5 [ILASM]  
6 .class public sealed serializable ThreadAbortException  
7 extends System.SystemException  
8  
9 [C#]  
10 public sealed class ThreadAbortException: SystemException
```

10 Assembly Info:

- 11 • Name: mscorlib
- 12 • Public Key: [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- 13 • Version: 1.0.x.x
- 14 • Attributes:
 - 15 ○ CLSCompliantAttribute(true)

16 Summary

17
18 Thrown by the system when a call is made to
19 **System.Threading.Thread.Abort**.

20 Inherits From: System.SystemException

21
22 **Library:** BCL

23
24 **Thread Safety:** All public static members of this type are safe for multithreaded
25 operations. No instance members are guaranteed to be thread safe.
26

27 Description

28 Instances of this exception type can only be created by the system.
29

30 When a call is made to **System.Threading.Thread.Abort** to
31 terminate a thread, the system throws a
32 **System.Threading.ThreadAbortException** in the target thread.
33 **System.Threading.ThreadAbortException** is a special exception
34 that can be caught by application code, but is rethrown at the end of
35 the catch block unless **System.Threading.Thread.ResetAbort** is
36 called. When the **ThreadAbortException** exception is raised, the
37 system executes any **finally** blocks for the target thread. The finally
38 blocks are executed even if **System.Threading.Thread.ResetAbort**
39 is called. If the abort is successful, the target thread is left in the
40 **System.Threading.ThreadState.Stopped** and
41 **System.Threading.ThreadState.Aborted** states.

1 Example

2

3 The following example demonstrates aborting a thread. The thread
4 that receives the **System.Threading.ThreadAbortException** uses
5 the **System.Threading.Thread.ResetAbort** method to cancel the
6 abort request and continue executing.

7

8

```
[C#]
```

9

```
using System;
```

10

```
using System.Threading;
```

11

```
using System.Security.Permissions;
```

12

```
public class ThreadWork {
```

13

```
    public static void DoWork() {
```

14

```
        try {
```

15

```
            for (int i=0; i<100; i++) {
```

16

```
                Console.WriteLine("Thread - working.");
```

17

```
                Thread.Sleep(100);
```

18

```
            }
```

19

```
        }
```

20

```
        catch (ThreadAbortException e) {
```

21

```
            Console.WriteLine("Thread - caught
```

22

```
ThreadAbortException - resetting.");
```

23

```
            Thread.ResetAbort();
```

24

```
        }
```

25

```
        Console.WriteLine("Thread - still alive and working.");
```

26

```
        Thread.Sleep(1000);
```

27

```
        Console.WriteLine("Thread - finished working.");
```

28

```
    }
```

29

```
}
```

30

```
class ThreadAbortTest{
```

31

```
    public static void Main() {
```

32

```
        ThreadStart myThreadDelegate = new
```

33

```
ThreadStart(ThreadWork.DoWork);
```

34

```
        Thread myThread = new Thread(myThreadDelegate);
```

35

```
        myThread.Start();
```

36

```
        Thread.Sleep(100);
```

37

```
        Console.WriteLine("Main - aborting my thread.");
```

38

```
        myThread.Abort();
```

39

```
        myThread.Join();
```

40

```
        Console.WriteLine("Main ending.");
```

41

```
    }
```

42

```
}
```

43

44

The output is

45

```
Thread - working.
```

46

47

48

49

```
1
2     Main - aborting my thread.
3
4
5     Thread - caught ThreadAbortException - resetting.
6
7
8     Thread - still alive and working.
9
10
11    Thread - finished working.
12
13
14    Main ending.
15
16
```

1 ThreadAbortException.ExceptionState

2 Property

```
3 [ILASM]
4 .property object ExceptionState { public hidebysig
5 specialname instance object get_ExceptionState() }
6
7 [C#]
8 public object ExceptionState { get; }
```

8 Summary

9 Gets an object that contains application-specific information related to
10 the thread abort.

11 Property Value

12

13 A **System.Object**.

14 Description

15 This property is read-only.

16

17 The object returned by this property is specified via the *stateInfo*
18 parameter of **System.Threading.Thread.Abort**. This property
19 returns **null** if no object was specified, or the
20 **System.Threading.Thread.Abort** method with no parameters was
21 called. The exact content and usage of this object is application-
22 defined; it is typically used to convey information that is meaningful to
23 the thread being aborted.

24
