

# System.Net.IPAddress Class

```
[ILASM]
.class public serializable IPAddress extends System.Object

[C#]
public class IPAddress
```

## Assembly Info:

- Name: System
- Public Key: [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- Version: 1.0.x.x
- Attributes:
  - CLSCompliantAttribute(true)

## Summary

Represents an Internet Protocol (IP) address.

## Inherits From: System.Object

**Library:** Networking

**Thread Safety:** All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

## Description

An instance of the **System.Net.IPAddress** class contains the value of an address on an IP network. This address is stored internally as a **System.Int64** in network-byte-order.

[Note: Different conventions are in use for ordering bytes within multi-byte data types. All IP address values must be sent over the network in network-byte-order. Network-byte-order puts the most significant byte first (also known as big-endian order). On the host, the ordering of bytes is platform-specific and this ordering is referred to as host-byte-order.]

The IP address can be represented as four numbers in the range 0-255 separated by periods (for example, "192.168.1.2"), known as dotted-quad notation.

[Note: The address space is fragmented into different types determined by bits 31-28 as shown in the following table.

Bits 31-28	Address type	Address range
------------	--------------	---------------

0xxx	class A	0.0.0.0-127.255.255.255
10xx	class B	128.0.0.0-191.255.255.255
110x	class C	192.0.0.0-223.255.255.255
1110	multicast	224.0.0.0-239.255.255.255
1111	reserved	240.0.0.0-255.255.255.255

]

Instances of the **System.Net.IPAddress** class are provided for common IP address values as shown in the following table.

Field	IP Address
Any	0.0.0.0
Broadcast	255.255.255.255
Loopback	127.0.0.1
None	255.255.255.255

6  
7  
8

# 1 IPAddress(System.Int64) Constructor

```
2 [ILASM]
3 public rtspecialname specialname instance void .ctor(int64
4 newAddress)
5
6 [C#]
7 public IPAddress(long newAddress)
```

## 7 Summary

8 Constructs and initializes a new instance of the  
9 **System.Net.IPAddress** class.

## 10 Parameters

11  
12

Parameter	Description
<i>newAddress</i>	A <b>System.Int64</b> containing the IP address in host-byte-order.

13  
14  
15  
16

## 14 Exceptions

Exception	Condition
<b>System.ArgumentOutOfRangeException</b>	<i>newAddress</i> is less than 0 or greater than 0x00000000FFFFFFFF.

17  
18  
19

# 1 IPAddress.Any Field

```
2 [ILASM]  
3 .field public static initOnly class System.Net.IPAddress  
4 Any  
5 [C#]  
6 public static readonly IPAddress Any
```

## 7 Summary

8 Indicates that the protocol will select which address to use.

## 9 Description

10 This field is read-only.

11  
12 This is equivalent to **System.Net.IPAddress.IPAddress**  
13 (0x0000000000000000) and represents the address 0.0.0.0.

14

# 1 IPAddress.Broadcast Field

```
2 [ILASM]  
3 .field public static initOnly class System.Net.IPAddress  
4 Broadcast  
5 [C#]  
6 public static readonly IPAddress Broadcast
```

## 7 Summary

8 Provides the IP broadcast address.

## 9 Description

10 This field is read-only.

11  
12 This is equivalent to **System.Net.IPAddress.IPAddress**  
13 (0x00000000FFFFFFFF) and represents the address 255.255.255.255.

14  
15 This value is used to simultaneously address every host on the  
16 network.

17  
18 [*Note:* Multiple fields are defined for this IP address based on prior art.  
19 This field is identical to **System.Net.IPAddress.None.**]

20

# 1 IPAddress.Loopback Field

```
2 [ILASM]  
3 .field public static initOnly class System.Net.IPAddress  
4 Loopback  
  
5 [C#]  
6 public static readonly IPAddress Loopback
```

## 7 Summary

8 Provides the IP loopback address.

## 9 Description

10 This field is read-only.

11  
12 This is equivalent to **System.Net.IPAddress.IPAddress**  
13 (0x000000000100007F) and represents the address 127.0.0.1.

14  
15 The loopback address is used to specify the address of the local  
16 computer.

17

# 1 IPAddress.None Field

```
2 [ILASM]  
3 .field public static initOnly class System.Net.IPAddress  
4 None  
5 [C#]  
6 public static readonly IPAddress None
```

## 7 Summary

8 Provides the IP address that indicates that no network interface should  
9 be used.

## 10 Description

11 This field is read-only.

12  
13 This is equivalent to **System.Net.IPAddress.IPAddress**  
14 (0x00000000FFFFFFFF) and represents the address 255.255.255.255.

15  
16 [Note: Multiple fields are defined for this IP address based on prior art.  
17 This field is identical to **System.Net.IPAddress.Broadcast**.]

18

# 1 IPAddress.Equals(System.Object) Method

```
2 [ILASM]  
3 .method public hidebysig virtual bool Equals(object  
4 comparand)  
5  
6 [C#]  
7 public override bool Equals(object comparand)
```

## 7 Summary

8 Determines whether the current instance and the specified  
9 **System.Object** represent the same IP address.

## 10 Parameters

Parameter	Description
<i>comparand</i>	A <b>System.Object</b> to compare to the current instance.

## 14 Return Value

16 A **System.Boolean** where **true** indicates *comparand* is an instance of  
17 the **System.Net.IPAddress** class and has the same  
18 **System.Net.IPAddress.Address** property value as the current  
19 instance; otherwise **false**.

## 20 Description

21 [Note: This method overrides **System.Object.Equals**.]  
22

# 1 IPAddress.GetHashCode() Method

```
2 [ILASM]  
3 .method public hidebysig virtual int32 GetHashCode()  
4 [C#]  
5 public override int GetHashCode()
```

## 6 Summary

7 Generates a hash code for the current instance.

## 8 Return Value

9

10 A **System.Int32** containing the hash code for the current instance.

## 11 Description

12 The algorithm used to generate the hash code is unspecified.

13

14 [*Note:* This method overrides **System.Object.GetHashCode.**]

15

# 1 IPAddress.HostToNetworkOrder(System.Int64) Method

```
3 [ILASM]  
4 .method public hidebysig static int64  
5 HostToNetworkOrder(int64 host)  
  
6 [C#]  
7 public static long HostToNetworkOrder(long host)
```

## 8 Summary

9 Converts a **System.Int64** from host-byte-order to network-byte-  
10 order.

## 11 Parameters

Parameter	Description
<i>host</i>	A <b>System.Int64</b> in host-byte-order.

## 15 Return Value

17 A **System.Int64** in network-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.HostToNetworkOrder(System.Int32) Method

```
3 [ILASM]
4 .method public hidebysig static int32
5 HostToNetworkOrder(int32 host)
6
7 [C#]
8 public static int HostToNetworkOrder(int host)
```

## 8 Summary

9 Converts a **System.Int32** from host-byte-order to network-byte-  
10 order.

## 11 Parameters

12  
13

Parameter	Description
<i>host</i>	A <b>System.Int32</b> in host-byte-order.

14  
15  
16

## 15 Return Value

17 A **System.Int32** in network-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.HostToNetworkOrder(System.Int16) Method

```
3 [ILASM]  
4 .method public hidebysig static int16  
5 HostToNetworkOrder(int16 host)  
  
6 [C#]  
7 public static short HostToNetworkOrder(short host)
```

## 8 Summary

9 Converts a **System.Int16** from host-byte-order to network-byte-  
10 order.

## 11 Parameters

12  
13

Parameter	Description
<i>host</i>	A <b>System.Int16</b> in host-byte-order.

14  
15  
16

## 15 Return Value

17 A **System.Int16** in network-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.IsLoopback(System.Net.IPAddress) Method

```
3 [ILASM]  
4 .method public hidebysig static bool IsLoopback(class  
5 System.Net.IPAddress address)  
  
6 [C#]  
7 public static bool IsLoopback(IPAddress address)
```

## 8 Summary

9 Returns a **System.Boolean** that indicates whether the specified IP  
10 address is a loopback address.

## 11 Parameters

12  
13

Parameter	Description
<i>address</i>	A <b>System.Net.IPAddress</b> containing the IP address to check.

14  
15  
16

## Return Value

17 **true** if *address* is a loopback address; otherwise **false**.

## 18 Description

19 All IP addresses of the form 127.X.Y.Z, where X, Y, and Z are in the  
20 range 0-255, are forwarded to the IP loopback address 127.0.0.1. The  
21 **System.Net.IPAddress.Loopback** address is used to specify the  
22 address of the local computer.

23

# 1 IPAddress.NetworkToHostOrder(System.I 2 nt64) Method

```
3 [ILASM]  
4 .method public hidebysig static int64  
5 NetworkToHostOrder(int64 network)  
  
6 [C#]  
7 public static long NetworkToHostOrder(long network)
```

## 8 Summary

9 Converts a **System.Int64** from network-byte-order to host-byte-  
10 order.

## 11 Parameters

12  
13

Parameter	Description
<i>network</i>	A <b>System.Int64</b> in network-byte-order.

14  
15  
16

## Return Value

17 A **System.Int64** in host-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.NetworkToHostOrder(System.Int32) Method

```
3 [ILASM]
4 .method public hidebysig static int32
5 NetworkToHostOrder(int32 network)
6
7 [C#]
8 public static int NetworkToHostOrder(int network)
```

## 8 Summary

9 Converts a **System.Int32** from network-byte-order to host-byte-  
10 order.

## 11 Parameters

12  
13

Parameter	Description
<i>network</i>	A <b>System.Int32</b> in network-byte-order.

14  
15  
16

## 15 Return Value

17 A **System.Int32** in host-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.NetworkToHostOrder(System.Int16) Method

```
3 [ILASM]
4 .method public hidebysig static int16
5 NetworkToHostOrder(int16 network)
6
7 [C#]
8 public static short NetworkToHostOrder(short network)
```

## 8 Summary

9 Converts a **System.Int16** from network-byte-order to host-byte-  
10 order.

## 11 Parameters

12  
13

Parameter	Description
<i>network</i>	A <b>System.Int16</b> in network-byte-order.

14  
15  
16

## 15 Return Value

17 A **System.Int16** in host-byte-order.

## 18 Description

19 This method performs conversions on systems where the host-byte-  
20 order differs from network-byte-order. On systems where this is not  
21 the case, this method does nothing.

22

# 1 IPAddress.Parse(System.String) Method

```
2 [ILASM]  
3 .method public hidebysig static class System.Net.IPAddress  
4 Parse(string ipString)  
  
5 [C#]  
6 public static IPAddress Parse(string ipString)
```

## 7 Summary

8 Converts a **System.String** representation of an IP address in dotted-  
9 quad notation, to a **System.Net.IPAddress** instance.

## 10 Parameters

11  
12

Parameter	Description
<i>ipString</i>	A <b>System.String</b> in dotted-quad notation containing the IP address to convert.

13  
14  
15

## 14 Return Value

16 A new **System.Net.IPAddress** instance that represents the address  
17 specified in *ipString*.

## 18 Description

19 [Note: An example of a string in dotted-quad notation is "127.0.0.1".]

## 20 Exceptions

21  
22

Exception	Condition
<b>System.ArgumentNullException</b>	<i>ipString</i> is <b>null</b> .
<b>System.FormatException</b>	<i>ipString</i> is not a valid IP address.

23  
24  
25

# 1 IPAddress.ToString() Method

```
2 [ILASM]  
3 .method public hidebysig virtual string ToString()  
4 [C#]  
5 public override string ToString()
```

## 6 Summary

7 Returns a **System.String** representation of the value of the current  
8 instance.

## 9 Return Value

10

11 A **System.String** representation of the current instance. The returned  
12 string is an IP address expressed in dotted-quad notation (for  
13 example, "192.168.1.2").

## 14 Description

15 [*Note:* The **System.Net.IPAddress.ToString** method converts the IP  
16 address stored in the **System.Net.IPAddress.Address** property of  
17 the current instance to a **System.String** containing the address in  
18 dotted-quad notation (for example, "192.168.1.2").

19

20 This method overrides **System.Object.ToString.**]

21

# 1 IPAddress.Address Property

```
2 [ILASM]
3 .property int64 Address { public hidebysig specialname
4 instance int64 get_Address() public hidebysig specialname
5 instance void set_Address(int64 value) }
6
7 [C#]
8 public long Address { get; set; }
```

## 8 Summary

9 Gets or sets an Internet Protocol (IP) address.

## 10 Property Value

11

12 A **System.Int64** containing the IP address in host-byte-order.

## 13 Description

14 [Note: To convert **System.Net.IPAddress.Address** to dotted-quad  
15 notation, use the **System.Net.IPAddress.ToString** method.]

## 16 Exceptions

17

18

Exception	Condition
<b>System.ArgumentOutOfRangeException</b>	The value specified in a set operation is less than 0 or greater than 0x00000000FFFFFFFF.

19

20

21

# 1 IPAddress.AddressFamily Property

```
2 [ILASM]
3 .property valuetype System.Net.Sockets.AddressFamily
4 AddressFamily { public hidebysig specialname instance
5 valuetype System.Net.Sockets.AddressFamily
6 get_AddressFamily() }
7
8 [C#]
9 public AddressFamily AddressFamily { get; }
```

## 9 Summary

10 Gets the address family.

## 11 Property Value

12

13 **System.Net.Sockets.AddressFamily.InterNetwork.**

## 14 Description

15 This property is read-only.

16
