```
[ILASM]  
.class public abstract serializable FieldInfo extends  
System.Reflection.MemberInfo  
  
[C#]  
public abstract class FieldInfo: MemberInfo
```

Assembly Info:

- *Name:* mscorlib
- *Public Key:* [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- *Version:* 1.0.x.x
- *Attributes:*
 - CLSCompliantAttribute(true)

Summary

Provides access to field metadata.

Inherits From: System.Reflection.MemberInfo

Library: Reflection

Thread Safety: All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

1 FieldInfo() Constructor

```
2 [ILASM]  
3 family rtspecialname specialname instance void .ctor()  
4 [C#]  
5 protected FieldInfo()
```

6 Summary

7 Constructs a new instance of the **System.Reflection.FieldInfo** class.

8

1 FieldInfo.GetValue(System.Object)

2 Method

```
3 [ILASM]  
4 .method public hidebysig virtual abstract object  
5 GetValue(object obj)  
  
6 [C#]  
7 public abstract object GetValue(object obj)
```

8 Summary

9 Obtains the value of the field that is reflected by the current instance
10 and contained in the specified object.

11 Parameters

12
13

Parameter	Description
<i>obj</i>	An object that contains the field value to be returned. If the field reflected by the current instance is static, <i>obj</i> is ignored. For non-static fields, <i>obj</i> is required to be an instance of a class that inherits or declares the field.

14
15
16

15 Return Value

17 A **System.Object** that contains the value of the field reflected by the
18 current instance.

19 Behaviors

20 Before returning the value, the system checks to see if the user has
21 access permission.

22 Exceptions

23
24

Exception	Condition
System.NotSupportedException	A field is marked literal, but the field does not have one of the accepted literal types. [Note: For information regarding the accepted literal types, see Partition II of the CLI Specification.]
System.FieldAccessException	The field reflected by the current instance is non-public, and the caller does not have permission to access non-public members.

1
2
3
4

Permissions

System.ArgumentException	The field reflected by the current instance is declared neither directly in <i>obj</i> nor in any class from which <i>obj</i> derives.
System.Reflection.TargetException	The field reflected by the current instance is non-static, and <i>obj</i> is null .

5
6
7

Permission	Description
System.Security.Permissions.ReflectionPermission	Requires permission to access non-public members of a type in loaded assemblies. See System.Security.Permissions.ReflectionPermissionFlag.MemberAccess .

1 **FieldInfo.SetValue(System.Object,**
2 **System.Object,**
3 **System.Reflection.BindingFlags,**
4 **System.Reflection.Binder,**
5 **System.Globalization.CultureInfo) Method**

```
6 [ILASM]  
7 .method public hidebysig virtual abstract void  
8 SetValue(object obj, object value, valuetype  
9 System.Reflection.BindingFlags invokeAttr, class  
10 System.Reflection.Binder binder, class  
11 System.Globalization.CultureInfo culture)  
  
12 [C#]  
13 public abstract void SetValue(object obj, object value,  
14 BindingFlags invokeAttr, Binder binder, CultureInfo  
15 culture)
```

16 **Summary**

17 Assigns the specified value to the field that is reflected by the current
18 instance and contained in the specified object.

19 **Parameters**

20
21

Parameter	Description
<i>obj</i>	The object whose field value will be set. If the field is static, <i>obj</i> is ignored. For non-static fields, <i>obj</i> is required to be an instance of a class that inherits or declares the field.
<i>value</i>	An object that contains the value to assign to the field contained by <i>obj</i> .
<i>invokeAttr</i>	A System.Reflection.BindingFlags value that controls the binding process.
<i>binder</i>	A System.Reflection.Binder instance that enables the binding, coercion of argument types, and invocation of members through reflection. If <i>binder</i> is null , the default binder of the current implementation is used.
<i>culture</i>	The only defined value for this parameter is null .

22
23

24 **Behaviors**

1 Before setting the value, the system verifies that the user has access
2 permission.

3 **Exceptions**

4
5

Exception	Condition
System.ArgumentException	The field reflected by the current instance is declared neither directly in <i>obj</i> nor in any class from which <i>obj</i> derives. <i>value</i> is not assignment-compatible with the type of the field reflected by the current instance.
System.FieldAccessException	The field reflected by the current instance is non-public, and the caller does not have permission to access non-public members.
System.Reflection.TargetException	The field reflected by the current instance is non-static, and <i>obj</i> is null .

6
7
8
9

Permissions

Permission	Description
System.Security.Permissions.ReflectionPermission	Requires permission to access non-public members of a type in loaded assemblies. See System.Security.Permissions.ReflectionPermissionFlag.MemberAccess .

10
11
12

1 FieldInfo.SetValue(System.Object, 2 System.Object) Method

```
3 [ILASM]  
4 .method public hidebysig instance void SetValue(object obj,  
5 object value)  
  
6 [C#]  
7 public void SetValue(object obj, object value)
```

8 Summary

9 Assigns the specified value to the field that is reflected by the current
10 instance and contained in the specified object.

11 Parameters

12
13

Parameter	Description
<i>obj</i>	The object whose field value will be set. If the field is static, <i>obj</i> is ignored. For non-static fields, <i>obj</i> is required to be an instance of a class that inherits or declares the field.
<i>value</i>	A System.Object that contains the value to assign to the field contained by <i>obj</i> .

14
15

15 Description

16 Before setting the value, the system verifies that the user has access
17 permission. If the user does not have access permission, a
18 **System.FieldAccessException** is thrown.

19 Exceptions

20
21

Exception	Condition
System.ArgumentException	The field reflected by the current instance is declared neither directly in <i>obj</i> nor in any class from which <i>obj</i> derives. <i>value</i> is not assignment-compatible with the type of the field reflected by the current instance.
System.FieldAccessException	The field reflected by the current instance is non-public, and the caller does not have permission to access non-public members.

1
2
3
4

Permissions

System.Reflection.TargetException	The field reflected by the current instance is non-static, and <i>obj</i> is null .
--	--

Permission	Description
System.Security.Permissions.ReflectionPermission	Requires permission to access non-public members of a type in loaded assemblies. See System.Security.Permissions.ReflectionPermissionFlag.MemberAccess .

5
6
7

1 FieldInfo.Attributes Property

```
2 [ILASM]
3 .property valuetype System.Reflection.FieldAttributes
4 Attributes { public hidebysig virtual abstract specialname
5 valuetype System.Reflection.FieldAttributes
6 get_Attributes() }
7
8 [C#]
9 public abstract FieldAttributes Attributes { get; }
```

9 Summary

10 Gets the attributes of the field reflected by the current instance.

11 Property Value

12

13 A **System.Reflection.FieldAttributes** value that indicates the
14 attributes of the field reflected by the current instance.

15 Behaviors

16 This property is read-only.

17 Usage

18 Use this property to determine the accessibility of the field reflected by
19 the current instance. Also use this property to determine if the field
20 reflected by the current instance can be set after it is initialized, is
21 implemented in native code, is a literal, or has a special name.

22 Example

23

24 The following example demonstrates obtaining the attributes of two
25 fields.

26

27

```
28 using System;
29 using System.Reflection;
30
31 class MyClass
32 {
33
34     public int MyPublicInstanceField;
35     private const int MyPrivateConstField = 10;
36
37 }
38
```

```

1      class FieldAttributesExample
2      {
3
4          public static void Main()
5          {
6
7              Type t = (typeof(MyClass));
8              string str;
9              FieldInfo[] fiAry = t.GetFields(BindingFlags.Static |
10             BindingFlags.Instance | BindingFlags.Public |
11             BindingFlags.NonPublic |
12             BindingFlags.DeclaredOnly);
13             foreach (FieldInfo fi in fiAry)
14             {
15                 Console.WriteLine("Field {0} is: ", fi.Name);
16                 str = ((fi.Attributes & FieldAttributes.Static) !=
17             0) ?
18                 "Static": "Instance";
19                 Console.Write(str + " ");
20                 str = ((fi.Attributes & FieldAttributes.Public) !=
21             0) ?
22                 "Public": "Not-Public";
23                 Console.Write(str + " ");
24                 str = ((fi.Attributes & FieldAttributes.Literal)
25             != 0) ?
26                 "Literal": String.Empty;
27                 Console.WriteLine(str);
28             }
29         }
30     }
31 }
32
33 }
34

```

```

35     The output is
36
37     Field MyPublicInstanceField is:
38
39     Instance Public
40
41
42     Field MyPrivateConstField is:
43
44

```

1
2 Static Not-Public Literal
3
4

1 FieldInfo.FieldType Property

```
2 [ILASM]  
3 .property class System.Type FieldType { public hidebysig  
4 virtual abstract specialname class System.Type  
5 get_FieldType() }  
6  
7 [C#]  
8 public abstract Type FieldType { get; }
```

8 Summary

9 Gets the type of the field reflected by the current instance.

10 Property Value

11

12 The **System.Type** of the field reflected by the current instance.

13 Description

14 This property is read-only.

15
