```
[ILASM]
.class public sealed serializable FileIOPermission extends
System.Security.CodeAccessPermission

[C#]
public sealed class FileIOPermission: CodeAccessPermission
```

## Assembly Info:

- *Public Key:* [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- *Version:* 1.0.x.x
- *Attributes:*
  - CLSCompliantAttribute(true)

## Implements:

- **System.Security.IPermission**

## Summary

Secures access to files and directories.

## Inherits From: System.Security.CodeAccessPermission

## Library: BCL

**Thread Safety:** All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

## Description

**System.Security.Permissions.FileIOPermission** objects describe protected operations on files and directories. Files and directories are specified using absolute paths. Case-sensitivity of files and directories is platform and file system dependent.

[*Note:* This permission distinguishes between the following types of file I/O access provided by

### **System.Security.Permissions.FileIOPermissionAccess:**

- **Read:** Read access to the contents of the file or access to information about the file, such as its length or last modification time.

- 1           • **Write**: Write access to the contents of the file or access to  
2           change information about the file, such as its name. Also allows  
3           for deletion and overwriting.
- 4           • **Append**: Ability to write to the end of a file only.
- 5           • **PathDiscovery**: Ability to obtain path information about a file.
- 6           • **NoAccess**: No access to the file or directory.
- 7           • **AllAccess**: Full access to the file or directory.

8           These access levels are independent, meaning that rights to one do  
9           not imply rights to another. For example, **Write** permission does not  
10          imply permission to **Read** or **Append**.  
11          **System.Security.Permissions.FileIOPermissionAccess** values can  
12          be combined using a bitwise OR operator.

13  
14          For information on security considerations when accessing files, see  
15          **System.IO.FileStream**.]

16  
17          The XML encoding of a **FileIOPermission** instance is defined below in  
18          EBNF format. The following conventions are used:

- 19           • All non-literals in the grammar below are shown in normal type.
- 20           • All literals are in bold font.

21          The following meta-language symbols are used:

- 22           • '\*' represents a meta-language symbol suffixing an expression  
23           that can appear zero or more times.
- 24           • '?' represents a meta-language symbol suffixing an expression  
25           that can appear zero or one time.
- 26           • '+' represents a meta-language symbol suffixing an expression  
27           that can appear one or more times.
- 28           • '(',')' is used to group literals, non-literals or a mixture of  
29           literals and non-literals.
- 30           • '|' denotes an exclusive disjunction between two expressions.
- 31           • '::= ' denotes a production rule where a left hand non-literal is  
32           replaced by a right hand expression containing literals, non-  
33           literals or both.

34          BuildVersion refers to the build version of the shipping CLI. This is  
35          specified as a dotted build number such as '2412.0'.  
36

1 ECMAPubKeyToken::= **b77a5c561934e089**  
2  
3 FileName refers to the full path and file name of a file, or to a path  
4 name, such as "C:\Temp\test.exe" or "C:\ ".  
5  
6 The XML encoding of a **FileIOPermission** instance is as follows:  
7  
8 FileIOPermissionXML::=  
9  
10 **<IPermission class="**  
11 **System.Security.Permissions.FileIOPermission,**  
12 **mscorlib,**

# 1 FileIOPermission(System.Security.Permissions.PermissionState) Constructor

```
3 [ILASM]  
4 public rtspecialname specialname instance void  
5 .ctor(valuetype System.Security.Permissions.PermissionState  
6 state)  
  
7 [C#]  
8 public FileIOPermission(PermissionState state)
```

## 9 Summary

10 Constructs and initializes a new instance of the  
11 **System.Security.Permissions.FileIOPermission** class with the  
12 specified **System.Security.Permissions.PermissionState** value.

## 13 Parameters

14  
15

Parameter	Description
<i>state</i>	A <b>System.Security.Permissions.PermissionState</b> value.

16  
17

## 17 Description

18 [*Note:* This constructor creates either fully restricted  
19 (**System.Security.Permissions.PermissionState.None**) or  
20 **System.Security.Permissions.PermissionState.Unrestricted**  
21 access to files and directories.]

## 22 Exceptions

23  
24

Exception	Condition
<b>System.ArgumentException</b>	<i>state</i> is not a valid <b>System.Security.Permissions.PermissionState</b> value.

25  
26

# FileIOPermission(System.Security.Permissions.FileIOPermissionAccess, System.String) Constructor

```
[ILASM]
public rtspecialname specialname instance void
.ctor(valuetype
System.Security.Permissions.FileIOPermissionAccess access,
string path)

[C#]
public FileIOPermission(FileIOPermissionAccess access,
string path)
```

## Summary

Constructs and initializes a new instance of the **System.Security.Permissions.FileIOPermission** class with the specified access to the specified file or directory.

## Parameters

Parameter	Description
<i>access</i>	One or more values defined in <b>System.Security.Permissions.FileIOPermissionAccess</b> . Specify multiple values using the bitwise OR operator.
<i>path</i>	The absolute path of the file or directory.

## Description

The set of characters that are invalid for use in file or directory names is platform specific.

## Exceptions

Exception	Condition
<b>System.ArgumentException</b>	<i>access</i> specifies values not defined in <b>System.Security.Permissions.FileIOPermissionAccess</b> . <i>path</i> contains one or more characters that are invalid for use in files or directory names. <i>path</i> did not specify the absolute path to the file or

# 1 FileIOPermission.Copy() Method

```
2 [ILASM]  
3 .method public hidebysig virtual class  
4 System.Security.IPermission Copy()  
  
5 [C#]  
6 public override IPermission Copy()
```

## 7 Summary

8 Returns a new **System.Security.Permissions.FileIOPermission**  
9 object containing the same values as the current instance.

## 10 Return Value

11

12 A new **System.Security.Permissions.FileIOPermission** containing  
13 the same values as the current instance.

## 14 Description

15 [*Note:* The object returned by this method represents the same level  
16 of access to files and directories as the current instance.

17

18 This method overrides  
19 **System.Security.CodeAccessPermission.Copy** and is implemented  
20 to support the **System.Security.IPermission** interface.]

21

# 1 FileIOPermission.FromXml(System.Security.SecurityElement) Method

```
3 [ILASM]  
4 .method public hidebysig virtual void FromXml(class  
5 System.Security.SecurityElement esd)  
  
6 [C#]  
7 public override void FromXml(SecurityElement esd)
```

## 8 Summary

9 Reconstructs the state of a  
10 **System.Security.Permissions.FileIOPermission** object using the  
11 specified XML encoding.

## 12 Parameters

Parameter	Description
<i>esd</i>	A <b>System.Security.SecurityElement</b> instance containing the XML encoding to use to reconstruct the state of a <b>System.Security.Permissions.FileIOPermission</b> object.

## 16 Description

17 The state of the current instance is changed to the state encoded in  
18 *esd*.

19  
20 [Note: For the XML encoding for this class, see the  
21 **System.Security.Permissions.FileIOPermission** class page.

22  
23 This method overrides  
24 **System.Security.CodeAccessPermission.FromXml.**]

## 25 Exceptions

Exception	Condition
<b>System.ArgumentNullException</b>	<i>esd</i> is <b>null</b> .
<b>System.ArgumentException</b>	<i>esd</i> does not contain the encoding for a <b>System.Security.Permissions.FileIOPermission</b> instance.  The version number of <i>esd</i> is not valid.

# FileIOPermission.Intersect(System.Security.IPermission) Method

```
[ILASM]
.method public hidebysig virtual class
System.Security.IPermission Intersect(class
System.Security.IPermission target)

[C#]
public override IPermission Intersect(IPermission target)
```

## Summary

Returns a new **System.Security.Permissions.FileIOPermission** object that is the intersection of the current instance and the specified object.

## Parameters

Parameter	Description
<i>target</i>	A <b>System.Security.Permissions.FileIOPermission</b> instance to intersect with the current instance.

## Return Value

A new **System.Security.Permissions.FileIOPermission** instance that represents the intersection of the current instance and *target*. If the intersection is empty or *target* is **null**, returns **null**. If the current instance is unrestricted, returns a copy of *target*. If *target* is unrestricted, returns a copy of the current instance.

## Description

[Note: The intersection of two permissions is a permission that secures the resources and operations secured by both permissions. Specifically, it represents the minimum permission such that any demand that passes both permissions will also pass their intersection.

This method overrides **System.Security.CodeAccessPermission.Intersect** and is implemented to support the **System.Security.IPermission** interface.]

## Exceptions

1  
2  
3

Exception	Condition
System.ArgumentException	<i>target</i> is not <b>null</b> and is not of type <b>System.Security.Permissions.FileIOPermission</b> .

# FileIOPermission.IsSubsetOf(System.Security.IPermission) Method

```
[ILASM]
.method public hidebysig virtual bool IsSubsetOf(class
System.Security.IPermission target)

[C#]
public override bool IsSubsetOf(IPermission target)
```

## Summary

Determines whether the current instance is a subset of the specified object.

## Parameters

Parameter	Description
<i>target</i>	A <b>System.Security.Permissions.FileIOPermission</b> instance that is to be tested for the subset relationship.

## Return Value

**true** if the current instance is a subset of *target*; otherwise, **false**. If the current instance is unrestricted, and *target* is not, returns **false**. If *target* is unrestricted, returns **true**. If *target* is **null** and no files or directories are secured by the current instance, returns **true**. If *target* is **null**, and the current instance secures one or more files or directories, returns **false**.

## Description

[*Note:* The current instance is a subset of *target* if the current instance specifies a set of accesses to resources that is wholly contained by *target*. For example, a permission that represents read access to a file is a subset of a permission that represents read and write access to the file.

If this method returns **true**, the current instance describes a level of access to files and directories that is also described by *target*.

This method overrides **System.Security.CodeAccessPermission.IsSubsetOf** and is implemented to support the **System.Security.IPermission** interface.]

1 **Exceptions**

2

3

Exception	Condition
<b>System.ArgumentException</b>	<i>target</i> is not <b>null</b> and is not of type <b>System.Security.Permissions.FileIOPermission</b> .

3 .method public hidebysig virtual class  
4 System.Security.SecurityElement ToXml()  
5  
6 [C#]  
7 public override SecurityElement ToXml()
```

## 7 Summary

8 Returns the XML encoding of the current instance.

## 9 Return Value

10

11 A **System.Security.SecurityElement** containing the XML encoding of  
12 the state of the current instance.

## 13 Description

14 [*Note:* For the XML encoding for this class, see the  
15 **System.Security.Permissions.FileIOPermission** class page.

# 1 FileIOPermission.Union(System.Security.I 2 Permission) Method

```
3 [ILASM]  
4 .method public hidebysig virtual class  
5 System.Security.IPermission Union(class  
6 System.Security.IPermission other)  
  
7 [C#]  
8 public override IPermission Union(IPermission other)
```

## 9 Summary

10 Returns a new **System.Security.Permissions.FileIOPermission**  
11 that is the union of the current instance and the specified object.

## 12 Parameters

13  
14

Parameter	Description
<i>other</i>	A <b>System.Security.Permissions.FileIOPermission</b> instance to combine with the current instance.

15  
16  
17

## Return Value

18 A new **System.Security.Permissions.FileIOPermission** instance  
19 that represents the union of the current instance and *other*. If the  
20 current instance or *other* is unrestricted, returns a  
21 **System.Security.Permissions.FileIOPermission** instance that is  
22 unrestricted. If *other* is **null**, returns a copy of the current instance via  
23 the **System.Security.IPermission.Copy** method. If the current  
24 instance and *other* do not specify any file or directory names, returns  
25 **null**.

## 26 Description

27 [Note: The result of a call to  
28 **System.Security.Permissions.FileIOPermission.Union** is a  
29 permission that represents all of the access to files and directories  
30 represented by the current instance as well as the access to files and  
31 directories represented by *other*. Any demand that passes either the  
32 current instance or *other* passes their union.

33  
34 This method overrides  
35 **System.Security.CodeAccessPermission.Union** and is  
36 implemented to support the **System.Security.IPermission**  
37 interface.]
