

1 System.Runtime.CompilerServices.Method 2 ImplOptions Enum

3
4

```
5 [ILASM]  
6 .class public sealed serializable MethodImplOptions extends  
7 System.Enum  
8 [C#]  
9 public enum MethodImplOptions
```

10 Assembly Info:

- 11 • *Name*: mscorlib
- 12 • *Public Key*: [00 00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- 13 • *Version*: 1.0.x.x
- 14 • *Attributes*:
 - 15 ○ CLSCompliantAttribute(true)

16 Summary

17

18 Defines the details of how a method is implemented.

19 Inherits From: System.Enum

20

21 **Library**: RuntimeInfrastructure

22

23 Description

24 This enumeration is used by
25 **System.Runtime.CompilerServices.MethodImplAttribute**.

26

1 MethodImplOptions.ForwardRef Field

```
2 [ILASM]  
3 .field public static literal valuetype  
4 System.Runtime.CompilerServices.MethodImplOptions  
5 ForwardRef = 16  
  
6 [C#]  
7 ForwardRef = 16
```

8 Summary

9 Specifies that the method is declared, but its implementation is
10 provided elsewhere.

11
12 [*Note:* For most languages, it is recommended that the notion of
13 "forward" be attached to methods using language syntax instead of
14 custom attributes.]

15

1 MethodImplOptions.InternalCall Field

```
2 [ILASM]  
3 .field public static literal valuetype  
4 System.Runtime.CompilerServices.MethodImplOptions  
5 InternalCall = 4096  
6  
7 [C#]  
8 InternalCall = 4096
```

8 Summary

9 Specifies an internal call.

10

11 [Note: An internal call is a call to a method implemented within the
12 system itself, providing additional functionality that regular managed
13 code cannot provide. **System.Object.MemberwiseClone** is an
14 example of an internally called method.]

15

1 MethodImplOptions.NoInlining Field

```
2 [ILASM]  
3 .field public static literal valuetype  
4 System.Runtime.CompilerServices.MethodImplOptions  
5 NoInlining = 8  
  
6 [C#]  
7 NoInlining = 8
```

8 Summary

9 Specifies that the method is not permitted to be inlined.

10

1 MethodImplOptions.Synchronized Field

```
2 [ILASM]  
3 .field public static literal valuetype  
4 System.Runtime.CompilerServices.MethodImplOptions  
5 Synchronized = 32  
  
6 [C#]  
7 Synchronized = 32
```

8 Summary

9 Specifies the method can be executed by only one thread at a time.

10
11 This option specifies that before a thread can execute the target
12 method, the thread is required to acquire a lock on either the current
13 instance or the **System.Type** object for the method's class. If the
14 target method is an instance method, the lock is on the current
15 instance. If the target is a static method, the lock is on the
16 **System.Type** object. Specifying this option causes the target method
17 to behave as though its statements are enclosed by
18 **System.Threading.Monitor.Enter** and
19 **System.Threading.Monitor.Exit** statements locking the previous
20 described object. This option and the **System.Threading.Monitor**
21 methods are functionally equivalent, and both are functionally
22 equivalent to enclosing the target method's code in a C# lock (this)
23 statement.

24
25 *[Note: Because this option holds the lock for the duration of the target*
26 *method, it should be used only when the entire method must be single*
27 *threaded. Use the **System.Threading.Monitor** methods (or the C#*
28 *lock statement) if the object lock can be taken after the method*
29 *begins, or released before the method ends. Any mechanism that uses*
30 *locks can cause an application to experience deadlocks and*
31 *performance degradation; for these reasons, use this option with care.*

32
33 For most languages, it is recommended that the notion of
34 "synchronized" be attached to methods using language syntax instead
35 of custom attributes.]

36

1 MethodImplOptions.Unmanaged Field

```
2 [ILASM]  
3 .field public static literal valuetype  
4 System.Runtime.CompilerServices.MethodImplOptions Unmanaged  
5 = 4  
  
6 [C#]  
7 Unmanaged = 4
```

8 Summary

9 Specifies that the method is implemented in unmanaged code.

10
