

System.Runtime.InteropServices.CallingConvention Enum

```
[ILAsm]
.class public sealed serializable CallingConvention extends System.Enum

[C#]
public enum CallingConvention
```

Assembly Info:

- *Name:* mscorlib
- *Public Key:* [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00 00]
- *Version:* 2.0.x.x
- *Attributes:*
 - CLSCompliantAttribute(true)

Summary

Indicates the calling convention used by a method located in an unmanaged shared library.

Inherits From: System.Enum

Library: RuntimeInfrastructure

Description

The values of this enumeration are used to specify the calling conventions required to call unmanaged methods implemented in shared libraries.

[*Note:* Implementers should map the semantics of specified calling conventions onto the calling conventions of the host OS.]

[*Note:* For additional information on shared libraries and an example of the use of the `System.Runtime.InteropServices.CallingConvention` enumeration, see the `System.Runtime.InteropServices.DllImportAttribute` class overview.]

1 CallingConvention.Cdecl Field

```
2 [ILAsm]  
3 .field public static literal valuetype  
4 System.Runtime.InteropServices.CallingConvention Cdecl = 2  
  
5 [C#]  
6 Cdecl = 2
```

7 Summary

8 Indicates that the `cdecl` calling convention is appropriate for a method call.

9
10 For example, on a Windows platform the
11 `System.Runtime.InteropServices.CallingConvention.Cdecl` convention produces
12 the following behavior:

Element	Behavior
Argument-passing order	Right to left.
Stack-maintenance responsibility	Calling function pops the arguments from the stack.

13
14 [Note: This is the default calling convention for functions compiled with 32-bit C and
15 C++ language compilers.]
16
17

1 CallingConvention.FastCall Field

```
2 [ILAsm]  
3 .field public static literal valuetype  
4 System.Runtime.InteropServices.CallingConvention FastCall = 5  
  
5 [C#]  
6 FastCall = 5
```

7 Summary

8 Indicates that the `fastcall` calling convention is appropriate for a method call.

9

10 [*Note:* On a Windows platform this convention indicates that arguments to functions are
11 to be passed in registers whenever possible.]

12

13

14

1 CallingConvention.StdCall Field

```
2 [ILAsm]  
3 .field public static literal valuetype  
4 System.Runtime.InteropServices.CallingConvention StdCall = 3  
  
5 [C#]  
6 StdCall = 3
```

7 Summary

8 Indicates that the `stdcall` calling convention is appropriate for a method.

9

10 For example, on a Windows platform the
11 `System.Runtime.InteropServices.CallingConvention.StdCall` convention produces
12 the following behavior:

Element	Behavior
Argument-passing order	Right to left.
Stack-maintenance responsibility	Called function pops its own arguments from the stack.

13

14

1 CallingConvention.ThisCall Field

```
2 [ILAsm]  
3 .field public static literal valuetype  
4 System.Runtime.InteropServices.CallingConvention ThisCall = 4  
  
5 [C#]  
6 ThisCall = 4
```

7 Summary

8 Indicates that the `thiscall` calling convention is appropriate for a method. This
9 convention is similar to the
10 `System.Runtime.InteropServices.CallingConvention.Cdecl` calling convention,
11 except that the last element that the caller pushes the stack is the `this` pointer.
12

13 For example, on a Windows platform the
14 `System.Runtime.InteropServices.CallingConvention.ThisCall` convention
15 produces the following behavior:

Element	Behavior
Argument-passing order	Right to left.
Stack-maintenance responsibility	Calling function pops the arguments from the stack.
<code>this</code> pointer	Pushed last onto the stack.

16
17 [Note: The `thiscall` calling convention is the default calling convention used by C++
18 member functions that are not called with a variable number of arguments.]
