

1 System.Reflection.Assembly Class

```
2 [ILAsm]  
3 .class public serializable Assembly extends System.Object  
  
4 [C#]  
5 public class Assembly
```

6 Assembly Info:

- 7 • *Name*: mscorlib
- 8 • *Public Key*: [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00]
- 9 • *Version*: 2.0.x.x
- 10 • *Attributes*:
 - 11 ○ CLSCompliantAttribute(true)

12 Summary

13 Defines a `System.Reflection.Assembly`, which is a reusable, versionable, and self-
14 describing building block of an application.

15 Inherits From: System.Object

16

17 **Library:** RuntimeInfrastructure

18

19 **Thread Safety:** This type is safe for multithreaded operations.

20

21 Description

22 An assembly is a reusable, versionable, self-describing deployment unit for types and
23 resources. Assemblies are the fundamental units of deployment, and consist of
24 collections of types and resources that are built to work together and form logical units
25 of functionality.

26

27 An assembly consists of the following two logical elements:

- 28 • The sets of types and resources that form some logical unit of functionality.
- 29 • A manifest, which is the metadata that describes how the types and resources of an
30 assembly relate and what they depend on to work properly.

31 The following information is captured in an assembly manifest:

- 32 • *Identity*. An assembly's identity includes its simple name (also called its weak
33 name), a version number, an optional culture if the assembly contains localized
34 resources, and an optional public key used to guarantee name uniqueness and to
35 "protect" the name from unwanted reuse.

- 1 • *Contents*. Assemblies contain types and resources. The manifest lists the names of
2 all the types and resources that are visible outside the assembly, along with
3 information about where they can be found within the assembly.

- 4 • *Dependencies*. Each assembly explicitly describes other assemblies that it is
5 dependent upon. Included in this dependency information is the version of each
6 dependency that was present when the manifest was built and tested. In this way
7 the "known good" configuration is recorded and can be reverted to in case of failures
8 due to version mismatches.

- 9 • *Requested Permissions*. As an assembly is being built, the assembly records the
10 set of permissions that the assembly requires to run.

11 [*Note*: For additional information about assemblies, see Partition II of the CLI Specification.]

12

13

14

1 `Assembly.CreateInstance(System.String)`

2 Method

```
3 [ILAsm]  
4 .method public hidebysig instance object CreateInstance(string typeName)  
5 [C#]  
6 public object CreateInstance(string typeName)
```

7 Summary

8 Locates the specified type from this assembly and creates an instance of it using case-
9 sensitive search.

10 Parameters

Parameter	Description
<i>typeName</i>	The name of the type to locate.

11 Return Value

12 An instance of `Object` representing the type, or `null` if *typeName* is not found.

14 Exceptions

Exception	Condition
System.ArgumentException	<i>typeName</i> is the empty string ("") or "\0anything".
System.ArgumentNullException	<i>typeName</i> is <code>null</code> .

15

16

1 Assembly.GetType(System.String) Method

```
2 [ILAsm]  
3 .method public hidebysig virtual class System.Type GetType(string name)  
4 [C#]  
5 public virtual Type GetType(string name)
```

6 Summary

7 Returns the `System.Type` object with the specified name defined in the current
8 assembly.

9 Parameters

Parameter	Description
<i>name</i>	A <code>System.String</code> containing the name of the type defined in the current assembly.

10

11 Return Value

12 A `System.Type` object that represents the specified type, or `null` if the specified
13 `System.Type` was not found.

14 Behaviors

15 As described above.

16

17 Exceptions

Exception	Condition
System.ArgumentException	<i>name</i> is equal to <code>System.String.Empty</code> or starts with the null character ('\0').
System.ArgumentNullException	<i>name</i> is <code>null</code> .

18

19

1 **Assembly.GetTypes()** Method

```
2 [ILAsm]  
3 .method public hidebysig virtual class System.Type[] GetTypes()  
4 [C#]  
5 public virtual Type[] GetTypes()
```

6 **Summary**

7 Returns the types defined in the current assembly.

8 **Return Value**

9 An array of type `System.Type` containing all of the types defined in the current
10 assembly.

11

1 `Assembly.Load(System.String)` Method

```
2 [ILAsm]  
3 .method public hidebysig static class System.Reflection.Assembly  
4 Load(string assemblyString)  
  
5 [C#]  
6 public static Assembly Load(string assemblyString)
```

7 Summary

8 Loads the specified assembly.

9 Parameters

Parameter	Description
<i>assemblyString</i>	A <code>System.String</code> containing the name of the assembly.

10 Return Value

12 The loaded `System.Reflection.Assembly`.

13 Exceptions

Exception	Condition
System.ArgumentNullException	<i>assemblyString</i> is null.
System.ArgumentException	<i>assemblyString</i> is equal to <code>System.String.Empty</code> or starts with the null character ('\0').
System.IO.FileNotFoundException	The <code>System.Reflection.Assembly</code> identified by <i>assemblyString</i> was not found.
System.BadImageFormatException	The <code>System.Reflection.Assembly</code> identified by <i>assemblyString</i> is not a valid assembly.

14
15

1 `Assembly.ToString()` Method

```
2 [ILAsm]  
3 .method public hidebysig virtual string ToString()  
4 [C#]  
5 public override string ToString()
```

6 **Summary**

7 Returns a `System.String` representation of the value of the current instance.

8 **Return Value**

9 A `System.String` representation of the current instance. The string takes into account
10 the current system culture.

11 **Description**

12 This method returns the `System.Reflection.Assembly.FullName` of the current
13 assembly.

14 [*Note:* This method overrides `System.Object.ToString`.]
15
16
17

18 **Example**

19 The following example demonstrates the use of the
20 `System.Reflection.Assembly.ToString` method in an assembly compiled into a file
21 named "HelloWorld".

```
22 [C#]  
23  
24 using System;  
25 using System.Reflection;  
26  
27 public class AssemblyExample {  
28     public static void Main() {  
29  
30         Assembly a = Assembly.Load("helloworld");  
31         Console.WriteLine(a.ToString());  
32     }  
33 }
```

34 The output is

35
36 HelloWorld, Version=0.0.0.0, Culture=neutral, PublicKeyToken=null
37

38

1 Assembly.FullName Property

```
2 [ILAsm]  
3 .property string FullName { public hidebysig virtual specialname string  
4 get_FullName() }  
  
5 [C#]  
6 public virtual string FullName { get; }
```

7 Summary

8 Gets the full name of the assembly.

9 Property Value

10 A System.String containing the full name of the assembly.

11 Description

12 This property is read-only.

13 Behaviors

14 As described above.

15

16 Default

17 The full name is returned in the following format:

18

19 *<assemblyTextualName>, Version=<major.minor.build.revision>, Culture=neutral,*
20 *PublicKeyToken=<publicKeyToken>*

21

22

23 [Note: The *<assemblyTextualName>* section of the string contains the textual name of
24 the assembly, and is equivalent to the name of the file into which the assembly manifest
25 is compiled. This name does not change even if the file with the assembly manifest is
26 later renamed. For additional information about assembly manifests, see Partition II of
27 the CLI Specification.

28

29 For information on the *Version* information in the full name of a
30 System.Reflection.Assembly, see System.Version.

31

32 The *<publicKeyToken>* is a System.String containing the value of the public key token
33 in hexadecimal format. A null *publicKeyToken* indicates that the current assembly is
34 private. For additional information about public keys and public key tokens, see Partition
35 II of the CLI Specification.

36

37]

1 Usage

2 This property is used by the `System.Reflection.Assembly.ToString` method.

3

4 Example

5 The following example demonstrates using the `System.Reflection.Assembly.FullName`
6 property to get the full name of an assembly compiled into a file named "HelloWorld".

7

8 [C#]

```
9 using System;  
10 using System.Reflection;  
11  
12 public class AssemblyExample {  
13     public static void Main() {  
14  
15         Assembly a = Assembly.Load("helloworld");  
16         Console.WriteLine(a.FullName);  
17     }  
18 }  
19
```

20 The output is

21

22 HelloWorld, Version=0.0.0.0, Culture=neutral, PublicKeyToken=null

23

24
