

# System.Security.Permissions.ReflectionPermissionAttribute Class

```
[ILAsm]
.class public sealed serializable ReflectionPermissionAttribute extends
System.Security.Permissions.CodeAccessSecurityAttribute

[C#]
public sealed class ReflectionPermissionAttribute :
CodeAccessSecurityAttribute
```

## Assembly Info:

- *Name:* mscorlib
- *Public Key:* [00 00 00 00 00 00 00 00 04 00 00 00 00 00 00 00]
- *Version:* 2.0.x.x
- *Attributes:*
  - CLSCompliantAttribute(true)

## Type Attributes:

- AttributeUsageAttribute(AttributeTargets.Assembly | AttributeTargets.Class | AttributeTargets.Struct | AttributeTargets.Constructor | AttributeTargets.Method, AllowMultiple=true, Inherited=false)

## Summary

Used to declaratively specify security actions to control access to non-public types using reflection.

## Inherits From: System.Security.Permissions.CodeAccessSecurityAttribute

**Library:** Reflection

**Thread Safety:** All public static members of this type are safe for multithreaded operations. No instance members are guaranteed to be thread safe.

## Description

[*Note:* The level of access to non-public types and members is specified using the `System.Security.Permissions.ReflectionPermissionAttribute.Flags` property and the `System.Security.Permissions.ReflectionPermissionFlag` enumeration.

The security information declared by a security attribute is stored in the metadata of the attribute target, and is accessed by the system at run-time. Security attributes are used for declarative security only. For imperative security, use the corresponding permission class, `System.Security.Permissions.ReflectionPermission`.

1 The allowable `System.Security.Permissions.ReflectionPermissionAttribute`  
2 targets are determined by the `System.Security.Permissions.SecurityAction` passed  
3 to the constructor.  
4  
5 ]

## 6 **Example**

7 The following example shows a declarative request for access to non-public members of  
8 loaded assemblies. The  
9 `System.Security.Permissions.SecurityAction.RequestMinimum` security action  
10 indicates that this is the minimum permission required for the target assembly to be  
11 able to execute.

```
12  
13 [assembly:ReflectionPermissionAttribute(SecurityAction.RequestMinimum,  
14 MemberAccess=true)]
```

15  
16 The following example shows how to demand that the calling code has unrestricted  
17 access to non-public types. Demands are typically made to protect methods or classes  
18 from malicious code.

```
19  
20 [ReflectionPermissionAttribute(SecurityAction.Demand, Unrestricted=true)]
```

21

1  
2 **ReflectionPermissionAttribute(System.Security.Permissions.SecurityAction) Constructor**  
3

```
4 [ILAsm]  
5 public rtspecialname specialname instance void .ctor(valuetype  
6 System.Security.Permissions.SecurityAction action)  
  
7 [C#]  
8 public ReflectionPermissionAttribute(SecurityAction action)
```

9 **Summary**

10 Constructs and initializes a new instance of the  
11 System.Security.Permissions.ReflectionPermissionAttribute class with the  
12 specified System.Security.Permissions.SecurityAction value.

13 **Parameters**

Parameter	Description
<i>action</i>	A System.Security.Permissions.SecurityAction value.

14  
15 **Exceptions**

Exception	Condition
<b>System.ArgumentException</b>	<i>action</i> is not a valid System.Security.Permissions.SecurityAction value.

16  
17

# 1 2 ReflectionPermissionAttribute.CreatePermissi 3 on() Method

```
4 [ILAsm]  
5 .method public hidebysig virtual class System.Security.IPermission  
6 CreatePermission()  
7 [C#]  
8 public override IPermission CreatePermission()
```

## 9 Summary

10 Returns a new System.Security.Permissions.ReflectionPermission that contains  
11 the security information of the current instance.

## 12 Return Value

13 A new System.Security.Permissions.ReflectionPermission object with the security  
14 information of the current instance.

## 15 Description

16 [Note: Applications typically do not call this method; it is intended for use by the  
17 system.

18  
19 The security information described by a security attribute is stored in the metadata of  
20 the attribute target, and is accessed by the system at run-time. The system uses the  
21 object returned by this method to convert the security information of the current  
22 instance into the form stored in metadata.

23  
24 This method overrides  
25 System.Security.Permissions.SecurityAttribute.CreatePermission.

26  
27 ]

28

# 1 ReflectionPermissionAttribute.Flags Property

```
2 [ILAsm]  
3 .property valuetype System.Security.Permissions.ReflectionPermissionFlag  
4 Flags { public hidebysig specialname instance valuetype  
5 System.Security.Permissions.ReflectionPermissionFlag get_Flags() public  
6 hidebysig specialname instance void set_Flags(valuetype  
7 System.Security.Permissions.ReflectionPermissionFlag value) }  
  
8 [C#]  
9 public ReflectionPermissionFlag Flags { get; set; }
```

## 10 Summary

11 Gets or sets levels of access to non-public types using reflection.

## 12 Property Value

13 One or more of the System.Security.Permissions.ReflectionPermissionFlag  
14 values.

## 15 Description

16 [*Note:* To specify multiple System.Security.Permissions.ReflectionPermissionFlag  
17 values for a set operation, use the bitwise OR operator.]
